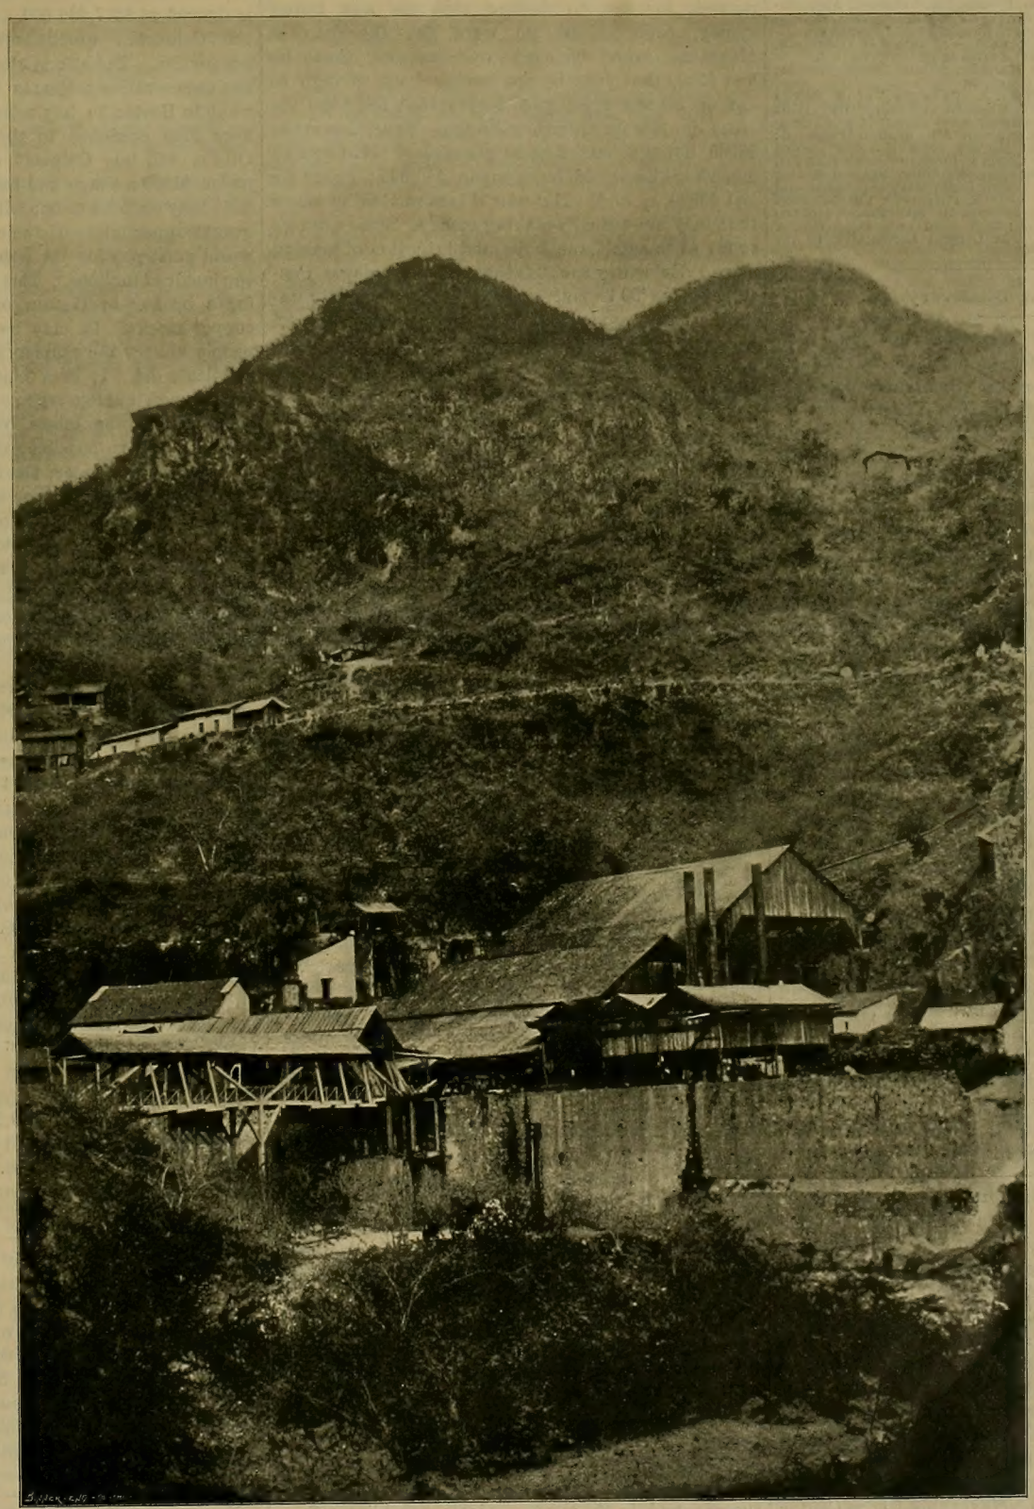
No. 2009.—VOLUME LXXVIII. Number 1. SAN FRANCISCO, SATURDAY, JANUARY 7, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Mexican Mineral Resources.

The Republic of Mexico is awakening, and its industrial development is of intimate value and interest to the United States. That country's mineral yield, great though it has been in the past, is evidently to be of still greater import, as its several States secure capital for transportation and mineral development. The State of Sinaloa is one of the prominent mining provinces of the Republic and is encouraging the investment of capital. Its mining tax on gold and silver yield is 1½%; less than that allowed by the Federal law, all metallurgical works being exempt. This tax in the calendar year of '97 amounted to $62,000, the yield of Sinaloa for that year being $1,418,500 gold and $3,571,500 silver. For three hundred years Sinaloa has been sending out gold and silver, and mining is to-day, as it always was, the State's principal industry. Up to a comparatively recent date the mint at Culiacan made little effort to separate the gold from the silver, hence the reason for the Chinese partiality to Mexican dollars, the Orientals learning from experience that Mexican dollars contained an appreciable percentage of gold, which they quickly utilized.

The extreme hardness of the country rock and the difficulty of securing adequate machinery have compelled the adoption of tunneling in development of ore bodies, crosscut tunnels having been driven in places a distance of 4000 feet. Among the State's principal mines are the Jesus Maria at San Jose de Gracia, La Piramide, and El Rosario. The first half of '98 the latter mine, after paying all expenses, distributed $137,500 in dividends among its stockholders. On La Purissima over half a million dollars has been spent in development work, with the recent result of uncovering a rich vein. In an area of 180 square miles are 150 registered mines, many of which are at present in enforced idleness. The oldest and most important of Sinaloa's mines is the Guadalupe de los Reyes, which has for over twenty years produced annually 200,000 tons ore. This mine has modern machinery, employs from 1000 to 1300 men, and is in every way a leading concern. The Panuco Mining Co. operates, at Panuco, a large mining property with modern methods, employing about 600 men, and is constantly paying dividends. Herewith is presented a general view of the Panuco Co.'s principal plant, and the character of the surrounding country. For this and most of the accompanying data the paper is indebted to the courtesy of J. R. Southworth, editor of "Sinaloa Illustrado," a work that is calculated to elicit interest in that section and aid in valuable trade connections between the two countries.



GENERAL VIEW OF THE PANUCO MINING CO.'S PLANT, PANUCO, SINALOA, MEXICO.

In the issue of Oct. 22d, '98, appeared the latest semi-official statement of the progress of the work of the U. S. Debris Commission, with engravings of the apparatus, etc., used in boring at the site of the proposed dam or restraining barrier near Smartsville, Yuba county, Cal., from photographs taken by Major W. H. Heuer, U. S. Corps of Engineers. At the time it was stated that the conditions developed by Mr. Vischer in boring indicated the necessity on the part of the commission of taking into consideration another and different project which is receiving present attention. The idea now of utilizing the $500,000 appropriated by the State and Federal Government is to divert the entire flow of the Yuba river, near the edge of the foothills, carry the stream in a deep canal 200 feet wide, leveed and gradually widened into a storage basin of sufficient area to handle the thousand million cubic yards of accumulated debris, the water to ultimately flow, freed from sediment, into the basin of the Feather and the Bear.

TABLE OF CONTENTS.

ILLUSTRATIONS.—General View of the Panuco Mining Co.'s Plant, Panuco, Sinaloa, Mexico, 1. Marine Enclosed Arc Lamp, 5. The Largest, Heaviest and Most Powerful Locomotive in America, 14-15.

EDITORIAL.—Mexican Mineral Resources; Progress of the Work of the U. S. Debris Commission, 1. Changing Fashions; Appreciation of Copper; Not a New Discovery; The "Apex," Etc., in British Columbia; Worries Left Over; Enterprising Newspapers, 2.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 6-7.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 26.

MISCELLANEOUS.—Concentrates, 3. "Fatigue" of a Stamp Stem; Electrical Transformers; Gilsonite in Utah; California at the 1900 Paris Exposition; The Heavy Steel Railroad Car, 4. Temperature of Battery Water, Etc.; How Aluminum is Produced; Treatment of Mercury and of Battery Plates; Not a Sucked Orange; Marine Enclosed Arc Lamp, 5. Index to Volume LXXVII, 8-9-10. Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs; Calendars; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 11. Mill Practice of the Utica Mills, Calaveras Co., Cal.; U. S. Gold Product for 1898; A Misstatement Corrected, 12. The Largest Locomotive in the World, 14.

Not a New Discovery.

Newspaper dispatches this week report the discoveries of "vast deposits" of platinum thirty miles from Granite Creek, on the Similkameen river, B. C. This is doubtless a "New Year's" way of announcing the existence of platinum in that region, a long-known fact. Just thirteen years ago placer miners in that spot found and threw away what they called "white iron." This journal investigated, with the result that the apparently worthless by-product was found to be platinum. Prof. Dawson exploited the whole thing thoroughly, the attention of the mining world was directed to the matter, the "Tulameen Improvement & Hydraulic Co." was organganized and considerable work done. It was Dawson's opinion that the belt of diorite cut by the stream at the point where the platinum was found was the matrix of that metal, though Blake, Van Cotta, and Aaron of this paper held that, as usual, throughout this entire region, it was only an incidental product from debris of serpentine or periodite. The last we heard of the company organized was in April, '95, when it increased its capital stock to 500,000 shares, and started in with considerable show of intent to work. There is no new discovery, but it is possible that an additional deposit has been found.

Platinum is one of the metals whose demand exceeds the supply. Thirty years ago it was $4.50 an ounce; ten years ago it bounded to $17.50 an ounce; in '92 it dropped to $7.50; to-day it is worth 60 shillings per ounce in London, $15.50 per ounce in New York City, and $16 in San Francisco, (pure). It is found in several localities where placer gold is produced, but never "in place," except in two districts in the Ural mountains, Russia, the only two localities where it is mined for itself alone.

FOR the first time in British dominions came up in December, '98, for legal adjudication the "apex," the "extralateral rights," and all the accompanying confusion so dear to many mining litigants. It was the case of the Iron Mask vs. the Center Star at Rossland, B. C. Under the old law of that province, (similar to the one now in force only in the United States and Bolivia, but happily repealed elsewhere) the Center Star was located and in the present suit claimed its rights under the law in force at the time of its location. The usual attendant legal jumble resulting in estoppels, injunctions, appeals and all the other skirmishing preliminary to the main trial, has resulted unfavorably to the Center Star, the Supreme Court negativing the setting aside of the injunction. The Center Star now appeals to Canada's highest legal tribunal, the Privy Council. Sometime, in the United States, the mining community will appeal to the highest court on earth—public opinion—with the result that that mightiest tribunal will set aside the present system with its attendant delay, vexation and expense.

Changing Fashions.

"Fashion" and "habit" have a good deal to do with business matters. They are outside of real merit, apart from tangible facts, yet guide and control things. Some time ago a mine operator wrote us from London that California mines were not "fashionable" in London. That condition was more potent than any other present factor. So, also, it is the "fashion" or not the "fashion" in other things; indeed, "fashion" rules. In the business world it has been the "fashion" since the failure of the Barings in '90 to whimper. This fashion came into wider vogue after the panic of '93, and since then it has been the "fashion" to say that one was losing money; if he was not "losing money" it was because he had no property to depreciate. It was quite the thing, and in line with the general custom, for one to declare that he was losing money, even though he were like the man in Montana, who declared one season that he lost $5000 that year by not having hogs enough to eat up all the mast and acorns that fell from the trees in his immediate vicinage. True, he made $5000, but that was of no circumstance. Had he had more hogs he would have made $10,000; hence he lost $5000, q. e. d. But now it is admitted by many that they are actually making money. Some even go so far as to admit the hope and intention of making more. Evidently the "fashion" is changing. Possibly before '99 is half gone it may be decidedly unfashionable to go around whimpering about alleged losing of money. It may be that expansion shall have something to do with it, and that the acquisition of the Antilles, Hawaii and the Philippines may have started the new fashion of acknowledging moderate prosperity and a cessation of the old, familiar whine of the past eight years; but, whatever the cause, it is manifest that the "fashion" is changing. It may, indeed, even come to pass that once more California mines may be "fashionable" in London.

The cause of all these ebbs and flows in the tide of business, of the "fashion" of alleging "hard times," and subsequently proclaiming prosperity, lies deep. It is as the great swing of Life's pendulum. Men and nations and the race have periods of distrust, of fear, and inaction. After such a period something starts the confidence of individuals themself and the confidence of the nation in itself, and men feel a sudden courage to undertake all enterprises and to indulge in effort tending to progress. Each one seems to encourage the other. Each enterprise seems to be an assistance to the other. The result is that for a series of years prosperity seems to increase; men are busy, capital is busy, and prosperity without limit seems to be within the reach of the race and the nation. Suddenly, from some cause entirely unanticipated, a doubt is cast upon the reality of the progress which has been made. Something awakens the elements of caution in the race and nation, and, thereupon, rapidly and steadily, confidence disappears. Men feel that it is necessary to take an exact observation of the situation before resuming strenuous efforts. When the hour arrives there is no possibility of retreat or of change. The race, or the nation, has determined to examine into its condition, and the result is apparent disaster, misfortune, defeat, and a general paralysis of business and of labor. There is a general liquidation of human affairs. Each man discovers what he is really worth, and the nation finds precisely what its absolute wants and needs are. If the spirit of prosperity could be expressed in a single word, that word would be confidence; and if the period of "adversity," as we call it, could be expressed in a single word that word would be distrust. During the period of progress, during the period of increased endeavor, where capital is employed and every man is at work, confidence reigns supreme. Every man believes in his own success and in the success of his neighbor. Consequently, he is free to take goods and property at the general valuation; and the people who sell property are ready to take checks and instruments by which property is transferred. When the period of doubt sets in values become uncertain, because it is felt that a readjustment must be had. Checks and evidence of transfer are scrutinized with care, because men who were wealthy yesterday may be poor to-day. So, also, production ceases, because the producer has great doubts whether the productions of his mill or his workshop will be capable of sale, and, above all, whether he will gather in the proper payment.

Panic has passed away; recuperation has set in; the tide of business again begins to flood; and with '99 comes amid changing conditions the "fashion" of prosperity. It is all a matter of "fashion," but such change is sure to come, and, surely, every one is glad that it is at hand, and that it again becomes the "fashion" to go ahead.

Appreciation of Copper.

Probably no Eastern city is more interested in mining enterprises than Boston, Mass. The total current market value of Boston's mining investments is figured at $217,000,000. It owns considerable of the California quicksilver and Montana copper properties. The stir in the latter is illustrated by the conservative estimate that $25,000,000 recently went to Boston to buy copper stocks. Boston brokers give credence to the story that the Standard Oil Co. will buy Calumet & Hecla "for anything under $1000 a share and hold it for $4000 a share"—that they propose to consolidate it with all the other great copper mines of the country, fix the price the world must pay for its copper and make money by the hundred millions. This is a good enough story for a broker in Boston or anywhere else to boom copper stocks. It may be that the Standard Oil people will try the same experiment that the French syndicate did. It is a matter of history that they had enough money when they started in to buy the leading copper mines, but only bought the mines' output. It is possible that, forewarned by the Frenchmen's disaster, the Standard Oil people may think they can improve on the method by buying the mines themselves, instead of the output, but, small as the world has grown to be, they will find it too big a contract to control the copper yield of the planet.

The appreciation of the copper mining industry of the United States is marvelous. In this regard a few figures are in order.

The U. S. copper production for '98 exceeds by about 10% that of '97. Arizona and Michigan show particularly large yield. In the Lake Superior district such a producer as the Calumet & Hecla, which in '97 turned out 83,248,054 lbs. fine copper, in '98 produced 95,000,000 lbs.; its '99 output is estimated at 100,000,000 lbs. In Arizona the United Verde, which in '97 yielded in fine copper 31,355,025 lbs., last year produced 48,000,000 lbs., and the Copper Queen advanced its output from 25,953,521 lbs. in '97 to 34,000,000 lbs. in '98. It is calculated that these two Arizona mines will this year produce 90,000,000 lbs. copper. In '97 Colorado produced 11,873,033 lbs. copper and, in '98, 14,250,000 lbs. California increased its copper production from 11,987,772 lbs. in '97 to 16,500,000 lbs. in '98. The Lake Superior district in its entirety last year yielded 156,942,897 lbs. fine copper; Arizona, 113,000,000 lbs.; Montana, 229,200,000 lbs. During '97 the United States produced 536,648,015 lbs. copper; during '98, 583,142,897 lbs. It is calculated that this year this country's copper output will exceed 650,000,000 lbs.

IN addition to the stock of old worries left over, is already announced in '99 that a crack "in the bottom of the sea" is liable to occasion the immediate precipitation of the entire volume of the oceans to the center of the earth, causing so violent an eruption as to destroy all life. Sir Robert Ball of London, an astronomer of repute, announces this latest disquieting possibility, which, were it to occur, would doubtless interfere with mining and scientific progress to an unsatisfactory extent.

FROM every principal mining town in this west half of America come handsome illustrated editions of enterprising newspapers recounting the record of '98 and showing the general advance and prosperity of the gold mining industry. All are unanimous in noting the advance in mining methods, the cheapening of ore treatment, and the prophesy of even better results in '99. In no other national industry is there a more hopeful or promising outlook.

Concentrates.

THE Hall mines, B. C., smelter has shut down till April 1st, '99.

OVER 30,000 men are now in the mines on the Canadian side of the Yukon.

THE Silverton, Colo., *Standard* declares that a zinc smelter would pay there.

RANDSBURG, CAL., expects in '99 to double its million-dollar gold output of '98.

COLORADO'S gold yield for '98 is more than the U. S. agrees to pay for the Philippines.

THE Dexter Mining Co. at Tuscarora, Nevada, has raised the wages of its employes.

FOR the last fifty years California's average annual gold output has been about $26,500,000.

THE Crœsus property of Hailey, Idaho, was sold this week to W. G. Page of Spokane, Wash., for $80,000.

IT is estimated that the United States is now exporting iron and steel at the rate of 1,250,000 tons per annum.

MONTANA mining papers make just and forcible presentation of the value and necessity of a Montana State Mining Bureau.

SILVER sulphurets or sulphides can be chloridized in the pan. The chemicals required are sodium chloride and copper sulphate.

GREEN LAKE, Colorado, is said to be the most elevated body of water in the United States, having an altitude of 10,252 feet above sea level.

THERE are about 30,000 men at present actively engaged in mining, smelting and milling ore in Colorado. In California there are about 20,000.

THE California State Miners' Association has invited the American Institute of Mining Engineers to hold the fall of '99 meeting in San Francisco.

THE Puget Sound Reduction Co. of Everett, Wash., is making four weekly shipments of gold and silver bullion to Denver that aggregate $75,000.

MONTANA'S success in its mining exhibit at Omaha will probably insure a fine exhibit of that State's mineral resources at the Paris Exposition.

A CONSERVATIVE estimate of Utah's metal output for '98 is of gold, 105,000 ounces; silver, 7,544,723 ounces; lead, 91,000,000 pounds; copper, 5,335,000 pounds.

WHILE attempting to attach a belt from the main shaft to the bucket elevator at the Sunnyside mine near Eureka, Colo., last week, W. McGraw was instantly killed.

THE Boise, Idaho, assay office estimates Idaho's metal production in '98 to aggregate in gold, $2,273,700; silver, $7,740,000; lead, $5,375,755; an increase of $1,659,570 over '97.

EIGHT miles from Carlin, Nevada, M. Sholl is opening what is described as an inexhaustible deposit of keisilgore, or infusorial earth, said to run 98% pure without calcining.

THE San Francisco Mint was established in April, 1854. To Nov. 30th, '98, its total coinage aggregated $1,171,989,854. Of this sum $1,017,923,507 was in gold; $154,066,347 in silver.

MATABELELAND, South Africa, but recently a savage jungle, and Dawson in Yukon wilds—the ends of the earth—now have gas, electric lights and other adjuncts of civilization.

SO FAR reports of "jumping" mining claims are fewer than in the beginning of former years, indicating greater care in complying with all legal requirements regarding unpatented mining claims.

THE Utica M. Co. of Angels, Cal., has contracted for an electric plant of 3000 H. P. to be installed at Murphy's, Cal., to transmit power and lights along the mother lode from San Andreas to Chinese Camp.

ON the 1st inst., for the first time in two years, came a storm from the southeast, bringing rain in the California valleys and foothills, and snow on the mountains, insuring a prosperous mining season for '99.

NOTWITHSTANDING the scarcity of water last season, Placer county, Cal., expects its gold output for '98 will equal that of the previous year, which placed it third on the list of California's gold producing counties.

THE San Giuseppe mine, Sonora, Tuolumne Co., Cal., has yielded about as pure gold as any in the knowledge of "Concentrates." It has an average fineness of 985. The average of the Mt. Morgan, Australia, gold is 980.

THE closing of the Gold Coin Co.'s operations near Anaconda, Montana, is locally viewed as an instance of the folly of a 30-stamp mill on a 10-stamp mine, operations being directed from the offices of Eastern owners some thousands of miles away.

THE London Mining Exhibition begins next May, and continues until October. United States makers of mining machinery have been invited to take part, and, as comparison must result favorably, it is good business to be properly represented there.

THE legal locator of a placer mining claim has the exclusive right to the possession thereof, and a prospector cannot legally enter the bounds of a placer claim and discover a subsequent lode claim unless there has been abandonment by the placer claimants.

THE material for the Risdon hydraulic plant to partially unwater the Comstock is arriving at Virginia City, Nev. The C. & C. shaft is about ready for the installation and the capacity of the drain flume in the Sutro tunnel has been increased to 800,000 gallons in twenty-four hours.

AT the Golden Jubilee Mining Exposition in San Francisco last February Calaveras Co., Cal., exhibited some handsome crystals from the Green Mountain mine, Mokelumne Hill. From one of these crystals a New York City jewelry firm has cut a perfect sphere 5¼ inches in diameter and worth $3000.

THE Boston Exploration Co., incorporated under Maine laws, capital $2,000,000, has for secretary R. L. Agassiz. The company owns gold mining properties in Colorado and Wyoming and is said to control the Smuggler Union M. Co. of Telluride. B. B. Lawrence of Denver is the chief engineer of the company.

IN '98 San Francisco imported 11,180 tons pig iron; 9616 tons from the East, 1564 from Europe. During '98 San Francisco consumed 1,832,373 tons coal. Of this 651,208 tons came from British Columbia, 201,931 from Australia, 75,115 from England, 5,056 from Scotland, 37,560 from the Eastern States, 632,437 from Washington.

THE value of uranium in the ore is about $10 for each per cent of a ton—that is, ore carrying from 70 to 80 per cent is worth from $700 to $800 per ton. As it is found in such comparatively small quantities it takes some time for any individual to gather up a ton. The best known in Colorado comes from Gilpin county, and runs about 70 per cent.

IT is a mistake to assume that anyone can successfully operate a mining property. It takes years of experience and as much skill to make a successful miner as to make a good civil engineer or lawyer or physician. This fact is of prime importance for consideration when a man is to be selected to take charge of the development of a mining property.

IN connection with the St. Joseph Lead Co., the National Lead Co. has concluded negotiations for the purchase of all lead companies in Missouri. This is calculated to give the latter a monopoly of the business. It is reported that the two new members to be added to the directory of the Lead Trust will represent the Standard Oil interests.

THE committee on the conservation of water recently appointed by the California State Miners' Association invites co-operation from the commercial bodies of the State, and suggests three representatives from each of such organizations at a meeting of the committee to be held at the office of the Surveyor-General in San Francisco on the 21st inst.

SOME TIME ago the people of California said they wanted a dredger. Effort was made and the Legislature passed "a dredger bill" appropriating $300,000. The money is being used, but so far no dredger has materialized. Those in charge announce that the people didn't know what they wanted, and they (those in charge) do. The patient public pay the taxes.

THE San Francisco mint coinage in '98 aggregated $68,933,173.70; of this amount $63,226,500 was in gold. The mint superintendent estimates California's '98 gold yield at approximately $15,000,000. The unusual drought occasioned a stoppage of all mine and mill work in several parts of the State. Supt. Leach estimates the State's silver yield for '98 at 700,000 standard ounces.

WYOMING reports the purchase by Chicago men, for $3,000,000, of a deposit of sulphate of soda fourteen miles from Laramie. Analysis is declared to show that this native soda consists of 44% pure sulphate of soda and 54% water. The supply is said to be practically inexhaustible. Products manufactured therefrom are in general use, and large quantities of this basis salt are imported from England and Germany.

THE United States Geological Survey places the amount of lead produced in the United States in '97 at 208,192 tons. Of this total product of lead of the United States the Cœur d'Alene, Idaho, mining district extracted from its mines and put upon the market over 115,000 tons—over 55 per cent of the entire output of the United States. This lead product was shipped in the form of galena concentrates, and was above an average of 16,000 tons of ore per month, which carried from 60 to 65 per cent lead and from thirty to eighty ounces silver per ton.

IT was recently stated herein that no California county maintained a mining bureau. The statement was contradicted in the case of Tuolumne Co., but further research confirms the exact truth of the original statement. The point was, and is, that all prominent mining centers in California, or any other mining State, would find public expenditure of public money a profitable investment in the maintenance of county mining bureaus. This is an age of advertising, and an advertisement is what all such things practically are.

IN California gold ore of the value of 84 cents a ton has been worked for 78 cents a ton, leaving a profit of 6 cents. In Utah (according to a statement uncontradicted since its appearance herein) silver is produced at a cost of 23½ cents per ounce. In Michigan and Montana copper is produced at a cost of 6 cents per pound. Aluminum sheet is now made 10 per cent cheaper than brass, and cheaper than any other metals except iron, zinc and lead. The decrease in the cost of production of the metals, precious and useful, is one of the marvels of modern metallurgy.

HUBNERITE, a manganiferous variety of wolframite, occurs in considerable quantity six miles from Dragoon station, on the S. P. Railway, Arizona, in white quartz veins, containing little iron, having a manganese oxide base, of brownish-red color, in tabular prismatic blocks or thick plates, completely enclosed in the quartz, and varying in weight from 15 to 500 pounds. It is a source of tungsten of great value in steel making, being in this regard considered superior to the ordinary wolframite. Last month a carload of the ore was concentrated at the Arizona School of Mines with excellent results.

ADVICE is usually worth what it costs, and in questions involving values in the domain of mining engineering or mining law, it is best, where practicable, to get competent advice and pay for it. If anything really important to the questioner is involved, it will usually prove the most satisfactory way. In case of disputes arbitration is preferable to litigation, and even in such cases it is often requisite to have some idea of the rights of each disputant before an opinion of any value can be furnished, and such opinion can be best supplied by a mining lawyer or mining engineer according to the matters involved.

THIS answers eleven questions this week: In California, within sixty days from date of placer discovery, the discoverer must put labor upon his location or claim amounting in the aggregate to at least $10. In California, within sixty days from date of vein or lode discovery, the discoverer must put labor upon his location or claim amounting in the aggregate to $50. In California, since May 26, '97, no record of mining claim or millsite is valid unless filed with the recorder of the county in which such claim or site is situated. Full information as to the acquiring the right to the use of running water in California appeared on page 631 of the issue of Dec. 24th, '98.

PLATINUM is found in this country almost exclusively in California placers. There have been "big" platinum finds reported in Colorado and elsewhere, but erroneously, though platinum is found in Custer county, Colorado. What is sometimes thought to be platinum is nothing but titanic iron, which exists in large quantities. When primitive assaying finds a button that looks like platinum, and that it does not yield to boiling in aquia regia, it is pronounced platinum, but when sulphuric acid is applied it disappears at once. There is a good excuse for the mistake, for titanic iron has a very strong resemblance to platinum.

THE superintendent of the Denver, Colo., branch mint states that the receipts there in '98 aggregated $20,195,995, a gain of $7,822,544 over the receipts of '97. Colorado's mineral production for '98 is locally estimated as follows: Gold, $23,500,000; silver, $15,000,000; copper, $1,205,000; lead, $3,450,000, an increase of $10,000,000 over the output of '97. Of the gold yield Cripple Creek district is credited with $15,000,000. J. B. Grant of the Omaha & Grant Smelting Co., Denver, says that in the mint receipts have appeared "a great portion of the gold production of Utah, considerable from Idaho, and much from Deadwood, S. D., mines, which was purchased by our company at Omaha and deposited here."

THE first stage of a gold quartz mine figures as a fissure in the earth's crust. The fracture may extend down as far as say 5000 feet, or to a point where the crust is pasty and elastic. The second stage is the vein filling. If the matrix be quartz it is a favorite theory that it must have been deposited there from and by the extremely hot water percolating through the shattered rock below, and finding its outlet through the open fissure. With the silica came the metallic sulphides, usually iron pyrites carrying gold. According to such hypotheses, as the waters loaded with the minerals approached the surface they gradually became cooler and the minerals were deposited in the fissure and the vein making was complete.

THE general law of the jungle finds its counterpart in the Yukon region in the unwritten law of the cache. An explorer may hang his coat, boots, accoutrements or any personal belongings in a tree, and find them there when he returns, even if weeks have elapsed. A cache of provisions is similarly respected, with the modification that a hungry man may open it and take food sufficient for his needs, first building a fire as an indication that no secrecy in the place is intended. In many other sections of the United States the latch-string is significant of singular communism. A settler's cabin in any emergency is more or less the cabin of any person in distress who may pass that way. If the settler be absent, the traveler may enter and make himself at home as his needs may require, always holding himself responsible for the proper appreciation of the privilege.

PETROLEUM and its derivatives are unable to rise in the geological scale from one porous formation to another. The principal deposits are hermetically sealed in the strata that contains them. The so-called "surface indications" of gas and oil are principally due to the numberless fractures through falls by which the contents of the porous rock can reach the surface. If it is possible for this prisoned gas to escape in any measurable degree, then the present figures must indicate the remainder of pressure after millions of years of waste. If it has ever escaped it is escaping now; if escaping now the pressure must be steadily falling unless through a constant replenishment. The facts do not seem consistent that any freedom of ascent of the bituminous series from stratum to stratum. In all accumulations of oil and gas the structure or arrangement of the strata involved is the dominant feature, and this controlling influence becomes more and more clear as the gas and oil fields of the world are adequately studied. It is probable that in the fields where salt water rises from deeply porous rocks under artesian pressure the same pressure will be exerted on the gas and oil which with the salt water are the joint tenants of the rock. Doubtless the rock pressure of gas wells in certain districts is due to the salt water that follows the gas, and it can be measured by the height to which this water rises above the gas reservoir.

THE value of a water power depends upon a variety of elements; numerous conditions may reduce its value. The essential points to be considered are as follows: Quantity of water during a dry year; uniformity of flow during the year, considering the storage capacity, natural and artificial; head of fall; conditions which fix the expense of building dam and canal, and flowage of land; conditions which affect the cost of foundations for buildings; geological conditions which determine the permanency of the fall; freight charges for fuel, supplies, raw materials and finished product; how much low-pressure steam can be used for heating purposes, and whether exhaust steam can be used for those purposes; if water is needed for other purposes than power, and in what quantities; the greater uniformity of speed with steam than with water power. The value of a variable power is usually very little if its variation is very great, unless it is to be supplemented by a steam plant. It is of value then only when the cost per H. P. for the double plant is less than the cost of steam power under the same conditions for a permanent power. The value of a developed water power is usually as follows: If the power can be run cheaper than steam the value is that of the power, plus the cost of plant, less depreciation. If it cannot be run as cheaply as steam, considering its cost, etc., the value of the power itself is nothing except in connection with possibilities in the direction of electricity or compressed air; but the value of the plant is such a sum as could be paid for it new, which would bring the total cost of running down to the cost of steam power, less depreciation. That is, it is worth just what can be got out of the plant, and no more.

FURTHER Japanese mining statistics in addition to those published last week show that the gold production in 1896 reached 28,300 ounces. The nineteen existing gold mines are partly in the Emperor's possessions, partly in that of private parties. The most important are those of Sado and Ikuno. Latterly gold has been discovered near Niko, which may become the center of the Japanese production of precious metals, since, besides gold, silver-lead ore has been found. By virtue of the Japanese laws, foreigners are permitted to participate in mining undertakings. Silver is found in forty-five places in Japan, and in 1896 afforded a yield of 1,500,000 ounces—an increase of almost 650,000 ounces since 1893. There are at present seventy copper mines. During the fiscal year ending June 30, '98, 35,000,000 catties, or about 500,000 centners of copper, valued at 5,800,000 yen (about $3,000,000), were mined. Since 1875 the copper production has increased about ninefold. Most copper is sent to Hongkong, thence to China and to England, the total export amounting to 350,000 centners, *i. e.*, five-sevenths of the whole production. Coal mining has, since the war, risen to about 1,500,000 tons, and in 1897 more than 2,000,000 tons of coal, valued at about $6,000,000, were exported. The companies carrying on coal mining are in good financial condition. Altogether there are 120 coal mines, of which, however, only about 50 are of any importance. The most productive is the Miike mine, in the province of Chikugo, yielding 600,000 tons per annum. A new coal field was discovered in 1895, and work has now been commenced on it. It is situated in the province of Iburi, on the river Mukawagawa, and is said to contain 40,000,000 tons above, and 30,000,000 tons below, the level of the sea. Aside from this last discovery, however, it has been computed that the coal stores of Japan, at the present rate of production, will be exhausted in forty-five years.

"Fatigue" of a Stamp Stem.

Assuming that the term, the "fatigue of a metal," means that state where relaxation of the cohesion of the particles begins to take place, which, in its effects and consequences, is the incipient stage of beginning fracture, it can be further assumed that this relaxation of cohesion or fatigue takes place at the weakest point of the structure. It is immaterial whether the weakness is caused by the design of the structure or inherent defects of the metal. Let us apply the foregoing to a stamp stem in service. We are told that stamp stems break close to the head; that they break less freely if care is taken in their use or if a cloth is wound around the stem before forcing on the head. Let us assume the stamp to be a solid cylinder of uniform dimensions throughout, without any head, and the metal be of ideal condition in every part. If this stamp strikes the ore in its descent the under or horizontal face receives a blow and vibrates the particles forming the surface of the stem. The blow being more violent than the under layers or head can absorb, the vibratory motion is continued through the length of the stamp, is conducted away and distributed uniformly throughout the mass. In a case like this the stamp will last longest, other things being equal, and the point of relaxation of cohesion—that is, fatigue—may appear anywhere.

In the case of a stamp with a head, the stem is evidently taxed more than the head in its efforts to relieve the head of the vibrations set up by the blows. The head presenting a larger surface there are a comparatively larger number of vibrations set up than the stem can conveniently conduct away or take care of. As a consequence there is a crowding and pushing at the point where the vibrations leave the head and enter the stem. This results in irregular, in cross and counter motions of the particles at that place, and fatigue must take place long before the upper part of the stem is affected. Let us consider the third case of a stamp striking one-sided, thus causing an excessive vibratory motion of the particle on one side of the stamp, overstraining the metal in one part and causing fatigue much sooner. But we have been told that stamp stems break sometimes near the weld if they are cut off and welded together. It is said that the stem then generally breaks at about 1 foot from the weld. Now, unless the stem is carefully annealed and slowly cooled after welding, it is obvious that outside the welded part, which was thoroughly hammered in order to insure a good weld, there must be a different structure of the metal, due to the comparatively high heat necessary to make a weld, but the effects of which were not removed by subsequent hammering, as in the welded part itself.

It matters but little whether the metal, 1 foot from the weld, was at a blue, black, or white heat. The structure at that part of the stem was undoubtedly in a highly agitated and disturbed state during the process of welding. This disturbed state of the particles was hindered from assuming its normal condition by the difference in structure of the hammered portion; hence the stem was weakest in that portion, and the subsequent vibrations, due to work done by the stem, tended to a relaxation of the cohesive force, or, in other words, fatigued that portion of the stem even sooner than at the junction of the head with the stem. This last proposition, if correct in its reasoning, is also the key to such breakages of stamp stems which may be due to flaws or irregularity of structure, and which act as an obstacle to the vibrations to be conducted freely and unobstructed from particle to particle.

Having now considered what we might possibly comprehend under the term fatigue of a metal—that is, a relaxation of the cohesive force holding the particles together; an incipient loosening of the tie which holds them all together by common interests; a slowly letting go of each other's hands, as it were, and a getting tired of standing firmly and immovably shoulder to shoulder to resist the common enemy, who is incessantly hammering away at the solid phalanx of defenders of strength to make a breach, a break and a wreck. This being so, we are now ready to examine the effects produced on the appearance of a fracture of a stamp stem.

A pulling strain carried to the point of rupture will tend to break up any existing crystalline structure of the metal strained and make coarse crystals finer or produce an amorphous structure. Hence the fractures of tension pieces are, as a rule, amorphous or finely granular. Compressive forces do not and cannot well have this modifying influence on those particles on which the force acts, and hence a transverse fracture of a stamp stem or like structure will show the natural "grain" of the metal. However fibrous the stem may have been there must be, from the nature of the thing, a granular fracture, because the compressive force absolutely prevents the extension in a vertical direction of the fiber, and since the zone of most fatigued metal lies at right angles to the central or tension line of the stem or axle, or stud or piston rod, the fracture must be a transverse section and representation of the fiber, or the face of the crystal, if the structure was crystalline; and since a fiber in a piece of iron is nothing but the elongated crystal in the puddle ball, its transverse section must be the size of the fiber and cannot be larger. Should the fracture exhibit a large "grain" or a so-called crystalline fracture, then we may safely assume that there was some high heating and slow cooling done with that stem or the iron is coldshort, or both. From the foregoing we may draw the conclusion that it is the fatigue of the metal at its most unfavorable point which induces fracture, and the crystalline appearance of this fracture is merely an incident, a circumstance of the force applied and the design of the stamp, or of its unequal structure, as the case may be; as, for instance, when it breaks near the weld.

There is reason to suppose that annealing of a stamp stem after, say, six months, would largely prevent its early breaking. Careful annealing and slow cooling is a wonderful corrective of irregularities in metals, and it would seem as if the heat shows the particles of a metal to rearrange themselves according to laws of which we know little.

Electrical Transformers.

Under the title "Transformer Design and Operation" the General Electric Company has issued in pamphlet form two important papers on the subject of electrical transformers—one, from the standpoint of the central station manager, by W. F. White, Gen. Mgr. Omaha, Neb., Electric Light & Power Company; the other, by Prof. Elwell Goldsborough, M. E., deals intimately with the question of transformer economy. The first paper, which was read before the American Institute of Electrical Engineers, is the record of long personal experience with the operation of transformers under actual commercial conditions, showing the relation of the many losses, incident to the use of many small transformers, to the earning capacity of the plant, and the tangible economies realized as the result of the substitution of a few high-efficiency transformers of large capacity. Mr. White gives examples of these economies reduced to dollars and cents. In his station a saving of $6000 per annum in the cost of coal alone was realized as the result of the practical application of lessons drawn from his extended observation and experience.

Prof. Goldsborough's paper was read before the National Electric Light Association and treats of the inherent economy of transformers of various design and construction. It contains many arguments in favor of the use of high-grade transformers, and emphasizes the necessity of frequent tests as the only means of detecting leaks, losses and the general depreciation of transformers. Prof. Goldsborough urges upon station managers the wisdom of keeping as vigilant a watch upon the efficiency of their transforming apparatus as upon the items of operating expense and maintenance, if economical results are to be obtained.

To these papers the General Electric Company has added several maps, showing graphically the significance of the substitution of a few large transformers for a few small ones. The pamphlet is, as usual, well printed and illustrated, and should find a prominent place in the literature of every alternating current station and every educational institution. It will be sent free by the General Electric Company, Claus Spreckels Bldg., San Francisco.

Gilsonite in Utah.

Uintaite (gilsonite) belongs to the group of hydrocarbons. It is in color black, the streak and powder being brown. Its luster is brilliant and retained after melting. It is easily fusible in candle flame, and acts like sealing wax, adhering more closely than the wax, however, to cold paper. It is readily soluble in heavy oils and fats, but is less so in lighter oils. In turpentine it is soluble readily when the oil is hot, but less so when cool. In carbon di-sulphide it is entirely soluble, and it is also soluble in alcohol up to 54.6 per cent. In either it dissolves slowly when in powder. It is a non-conductor of electricity and is electrically excited by friction. The principal uses for the gilsonite are: For preventing electrolytic action on iron plates of ship bottoms; for coating barbed-wire fences, etc.; for coating sea walls of brick or masonry; for covering paving brick; for acid-proof lining for chemical tanks; for roofing pitch; for insulating electric wires; for smoke-stack paint; for lubricants for heavy machinery; for preserving iron pipes from corrosion and acids; as a substitute for rubber. The largest known deposit is in the Uncompahgre Indian reservation, Utah, where it occurs in numerous veins from 3 to 13 feet wide, not solid between the wall rocks, but interspersed with frequent breaks of barren rock. It is mined by ordinary pick work, about two tons being a fair day's labor. Mining it costs about $1 per ton. Its dust is exceedingly annoying to the miner, and, mixed with air, is explosive. It is shipped principally to Chicago and St. Louis, where it costs, laid down, about $35 per ton, the price being from $45 to $50 per ton.

California at the 1900 Paris Exposition.

To the Editor:—California throughout the world has been recognized as the great gold producer; her output, as yet, has not been equaled, but to-day we are confronted with unfavorable conditions, which call for active work to enable the State to maintain her position as a mineral producer. These unfavorable conditions are: First, partial suppression of hydraulic mining, which formerly produced $1,000,000 per month; second, lack of water, in consequence of the drought; third, lack of capital, for the development of the vast area of mineral lands now known to exist. The first is being gradually reinstated by the intelligent work of the California Miners' Association. The second is beyond man's control, while the third—the lack of capital—is all our own fault, and it is this fault we should start in and correct. The present, we must understand, is an illustrative, an advertising age; if the merchant or manufacturer wants to get the benefits of trade he must advertise his wares and advantages, for the public to ponder over and act upon. If a State wants to build up in population and material wealth, she must put forth evidences of what she may claim for the great benefit of both capital and population. At no exposition in Europe, where any amount of capital is obtainable at 3 per cent per annum, has California been properly placed before the vast mass of people who visit them to see the attractive features, advantages for the investment of capital, as well as the advancement in arts, science and mechanics.

At the Paris Exposition of 1878 there were over 16,000,000 admissions, and this was twenty years ago. How much the world has grown since! how much more boldly America stands before all Europe! and how much more important California stands before the eyes of capital, facing as she does the "Far East" and the Pacific ocean—the coming field of commercial greatness! California, with her 800 miles of sea coast, must take her position, in this new period, as pre-eminent on the Pacific; to do this we must step forward, and "wake up" to the advantages to be gained through the coming exposition by letting the world know what we have for capital to engage in, and population to be benefitted from. To the Paris Exposition of 1900 there will possibly be 30,000,000 visitors; the advantages of placing our State before such a vast concourse of people needs no comment; the benefit is apparent, especially when we can show that we have only commenced to mine for gold, that we have mountains of iron, and enough copper undeveloped to line the "Far East" with the West. Metallic wealth, and the development of it, means business progress and prosperity for every pursuit outside of it. It means more population for the farmer, merchant and manufacturer to supply. It means more commerce, more interchange of products. I speak of minerals, as in their great variety they are attractive to the multitude and draw more largely on capital than anything outside of U. S. bonds, but the argument as to display applies to all our products. The opening of the 20th century is a propitious period for California's second step in material progress. Fifty years ago the pioneer commenced the carving out of her destiny, the result of his labor is before us, and now it is for the native sons to take the future and place before the European world what we have, and what the possibilities are with ample climate and immigration. No matter how old, we are all kindergarten scholars, as what we see impresses our minds, while what we read is fleeting. Hence, we should impress by display. Much must be done for California to maintain her status. We must remember she will stand in a field of the many States of this great American Union. What should be done, by the way of appropriations, for the coming great exposition, our legislators no doubt will fully canvass; it is not my province here to even suggest, but I will say the occasion and the new era now dawning calls for no meager sum; we should show that we grasp the present advantage and the future's expansion.

I speak of a new era. Is it not a new era for the Pacific States when we realize the fact that over Hawaii, the Ladrones and the Philippines will float the stars and stripes, giving a guarantee for future great activity in all departments of industry? Under such an outlook for business, it is not for our legislators to figure closely, but to think and act broadly. A liberal appropriation for a proper display at the exposition of 1900 will, no doubt, receive the approbation of the people, while a meager one will be derided as mere pretence. Let us do credit to ourselves.

Almarin B. Paul.

San Francisco, Cal., Jan. 3rd, '99.

The bringing into use of the heavy steel railroad car has done much to increase the consumption of steel, as heavier tracks have become a necessity and the wooden bridges which have been in use so long in many parts of the country are giving way to steel bridges. Figures at hand show that almost 800,000 tons of steel was used during the year in replacing lighter wooden bridges, and the change has but begun. Lately, too, piping and tubing of all kinds have been made of steel, until it is estimated that

about 75 per cent of the entire production of the country is of steel. The old lapweld joint is a thing of the past, and steel tubes have been found to be more durable in every way.

Temperature of Battery Water, Etc.

TO THE EDITOR:—I have noticed several articles lately in your paper regarding the proper temperature of the water for amalgamation in batteries. I will state briefly my own experience in this matter through a period of thirty-five years, not only in battery but also in pan amalgamation.

Your correspondents at Baker City, Or., and Sonora, Cal., advocate a high temperature as essential to effect proper amalgamation. The most careful tests made by myself in a battery mill in California and pan mill in Nevada proved conclusively that the amalgamation was not in the least promoted by heat between the range of 40° and 90° Fahr. This is in accord with the well-known fact that chemical action is promoted by heat, but it does not apply to an amalgam which is not a chemical combination, but a mechanical compound—an alloy.

The tests were as follows: In the 10-stamp Big Canyon Creek mill one battery of five stamps was supplied with water of natural temperature (40°), and the other battery with water heated in furnace to 90°. The ore was thoroughly mixed and the shovelfuls fed alternately to the batteries.

This test was continued for five days, and I will add here that the gold was free—quite free—and readily yielded to amalgamation. There was no difference in the result per ton of ore. If there was any advantage to either mode, it was for the water at 40°, for the reason that with warm water (90°) the quicksilver on the plates was found to trickle and flow away, and it required close and constant attention to prevent loss from that cause; and for the additional reason that warm water at 80° to 90° was also found to deleteriously affect the outside plates by the formation of oxide of copper, which seldom occurred in the use of cold water, and then only in slight degree. And this bad effect had to be closely guarded against to prevent any serious loss.

In pan amalgamation on the Comstock ores we soon found that high heat (180° to 185°) was required. This was necessary not because it promoted amalgamation, but for the purpose of effecting the decomposition and reaction of the chemicals used (chloride of sodium and sulphate of copper in the presence of sulphide of silver, mercury and the iron of the pan).

On free gold ores worked by the pan process I could not discover any increase in the yield of gold by using warm or hot water. I made long-continued comparative tests for the purpose of reaching a conclusion, with the result stated. These pan tests were made under the same conditions, viz., on the same ore, in two pans of the same size and construction, having the same speed and time of charge, and the same degree of thickness of the pulp, the only difference being that one was cold and the other hot.

I will say nothing more on the question of temperature as affecting amalgamation, but will pass to a point made by your correspondent in the same article, to-wit: that the brush or broom, when used on the outside plates of a battery, should be drawn lengthwise of the plates. This statement is an error for obvious reasons. He used his brush or broom in the wrong direction. The broom should be drawn across the plates, so as to form slight ridges, which serve to catch and hold the particles of free gold, especially the fine gold, as they flow down and across the edges of the ridges or corrugations. The effect is exactly the reverse if the brooms are drawn longitudinally from bottom to top of the plates. The gold particles in such case flow down the hollows or troughs formed by the brooms, and not over the ridges. The difference in result is very observable in favor of the cross movement as shown by careful comparative trials of two 5-stamp batteries.

Sonora, Cal., Dec. 26th, '98. LOUIS BLANDING.

How Aluminum is Produced.

Aluminum is now made at Niagara Falls about as cheap as brass, bulk for bulk, but not pound for pound, for aluminum is very light, its specific gravity being only about one-third that of iron. Native aluminum is found in clay and silicate, mixed with red oxide of iron. When separated from other substances it is a white powder. Electricity is the chief factor in the production of metallic aluminum. The powdered aluminum is placed in vats lined with carbon. Immediately over the vat is constructed a metal framework, through which are constructed a number of carbon rods 18 and 20 inches long and from 2 to 2½ inches in diameter. This framework is insulated electrically from the iron crucibles. The framework and the carbons are connected with the positive conductor of the electric current, and the vat or crucible with the negative.

These conductors are 1 foot wide and 1 inch thick, they carry a current equal to 3050 H. P., of great volume, but very low voltage, the electro-motive force at each vat or crucible being only about seven volts. As the process is electrolytic, and not simply a heating process, the direct current must be used and therefore must be transformed twice, first to bring it to a proper voltage, and second to change it from an alternating to a direct current. These iron vats or crucibles are connected in series, electrically, and then filled with the alumina and other materials, which act either as a flux and as a means of increasing the conductivity of the mixture. When all the crucibles are filled with the mixture the current is turned on and kept on continuously, day and night, seven days in the week. All of the materials in the different crucibles are heated to redness when the process of separation takes place. The oxygen of the alumina is thrown off as gas, and other residuum floats to the top of the crucible and is skimmed off. Metallic aluminum in a melted state sinks to the bottom of the crucible, where it is dipped out from time to time with large iron ladles and poured into sand and molded into blocks similar to that of pig iron. Aluminum is most useful as an alloy with other metals; it being extensively used in many directions, and would be vastly more used except that up to date no satisfactory way has been discovered to solder it. In different compounds it is estimated that aluminum forms about one-twelfth of the crust of the earth.

Treatment of Mercury and of Battery Plates.

TO THE EDITOR:—It is gratifying to note the tendency of men skilled and experienced in stamp mill practice to give to their co-workers the benefit of their knowledge of the subject. To them its rapid advancement during the past fifteen years is largely due, and not to those who strive to appear wise as the work-ox with the concealed knowledge of mysterious nostrums which each considers his exclusively.

The warning given in your issue of Dec. 3rd is heartily seconded by the writer of the article therein referred to. The suggested possibility of some of the acid used in cleaning the mercury finding its way to the amalgamated plates seems to warrant giving more details of the method used, which were omitted for brevity's sake. The mercury in a shallow vessel was covered to the depth of about half an inch with a solution of one part nitric acid to three parts water. This was allowed to stand from six to ten hours, when it was poured off, and the mercury thoroughly washed by submerging in it the end of a small hose and carefully turning on a small amount of water, which was allowed to flow over the edges of the vessel into a pan, in which it was placed to catch any particles that might escape. The mercury was then covered by a solution of one ounce of cyanide of potassium to two quarts of water to the same depth as before. This was allowed to remain about ten hours, poured off, and a fresh but weaker cyanide solution used, to barely cover the mercury until it was used. It was then impossible for any trace of the acid to reach the plates, where it certainly would have a ruinous effect.

A strong solution of cyanide of potassium is nearly as bad; though it is less generally used than before the introduction of the cyanide process, by which its solvent action on gold became more generally known.

Occasionally, however, we meet with a mill man who still clings to its use for removing the green oxide of copper which appears on plates too thinly covered with amalgam, or silver plating. The remedy will be found to be worse for the plates than the evil it is intended to cure, for, by its continued use, the plates will soon become so "hard" that the mercury will not adhere to them, but gather in globules, and finally disappear with the pulp passing over them.

Cyanide solution, when used on plates, should be so weak as to barely show its repellant action on their surface. In fact, save in exceptional cases, we believe the less used the better for final results. A saturated solution in a bottle, conspicuously labeled, will be found convenient when cyanide is needed, as a very small amount of this added to some water will make a solution as strong as should be used on the plates.

Feeding lumps of cyanide of potassium in the mortars is another pernicious practice still followed by some mill men, by which a portion of the gold is dissolved, and, passing off in the water, escapes detection by the ordinary assay of the tailings. The interesting article by Mr. Matt W. Alderson, in your issue of Oct. 29th, seems to support this view. We know of mills in which a marked discrepancy appeared between the assays of ore and tailings, and the amount of amalgam won, which gave rise to suspicions of the millmen's honesty. Investigation disclosed the fact that they had been feeding lump cyanide in the mortar at frequent intervals. In two recent instances we know that this discrepancy disappeared when the practice was stopped. The mill man had not known his reputation for honesty, as well as skill, was being dissolved along with the gold by cyanide of potassium fed in the mortars.

Baker City, Or., Dec. 25th, '98. MILLMAN.

Not a Sucked Orange.

TO THE EDITOR:—At a recent gathering of representative and influential men of California in San Francisco, no less a personage than President Jordan of Stanford University made the following statement: "In a few years Alaska will have no resources left. Then we may throw it away, like a sucked orange."

Not one voice was raised to challenge this assertion, though among those present was Senator Perkins, whose interests lie largely in this country. President Jordan commands my highest admiration for his great ability, and his statements usually are indisputable, but in this he is most certainly mistaken.

Can he deliberately say that "in a few years" the fisheries of this vast country will be exhausted? If, as a scientist, he can say this, then those who have invested their millions in this business had better begin to dispose of their holdings.

Upon the matter of the mining interests here I speak with less hesitancy. Any one acquainted, even superficially, with the mining industry of the coast portion of this district will recognize the indisputable fact that in a thousand years of active work the extraction of the precious metals from the mountains of Alaska will have but commenced. From the conditions existing in Alaska the development of all its resources, mining more especially, must proceed slowly, and for that reason they will last the longer; but, if we may judge the future by the past, we may confidently expect that Alaska will continue to pour into our common country increasing streams of gold for many centuries to come.

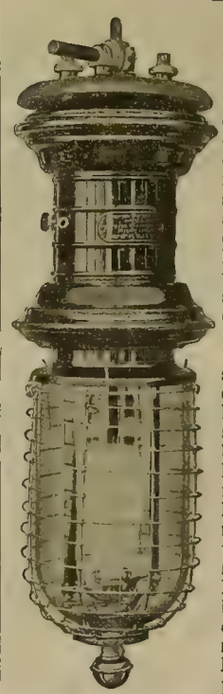
Then the timber wealth of this country must not be ignored. It is now little thought of because of the supplies of better timber nearer the markets of the world, but, in time, the practically inexhaustible supplies of timber in this district will prove of inestimable value.

Dr. Jordan surely does not intentionally desire to injure Alaska, but his statement will carry with it such authority that many will be influenced to our hurt. Great men cannot be too careful of their facts when making positive statements.

N. S. TROWBRIDGE.

Sumdum, Alaska, Dec. 10th, '98.

Marine Enclosed Arc Lamp.



Adequate electric illumination of wharves, docks, warehouses, dry docks, ship yards, with their adjacent iron working shops, and the holds of vessels, while loading or discharging, demands a type of lamp somewhat different from that used for street or store lighting. It must be strong, compact and durable, or it will not withstand the hard usage which such service will naturally give it. It should give a large volume of clear, white light, which will not dazzle the eyes of the workmen nor throw heavy shadows in already obscure corners; it should require little attention, and be so simple that it can be attended by an average lamp trimmer; lastly, it should require trimming not daily, but only at long intervals. A lamp which meets these requirements is the marine enclosed arc lamp, manufactured by the General Electric Company. It has been made the object of special design to adapt it to marine usage on shipboard or land. The mechanism is compact, simple and reliable, and is protected from injury or the effects of the weather by a stout metal casing. It is only necessary to renew the upper or long carbon once in 100 to 150 hours, the lower carbon, after the first run, being the unburnt remainder of the upper carbon. With open arc lamps it was necessary to renew the carbons daily. The outer globe, shown as of clear glass in the illustration, is cylindrical in shape, of glass, and protected from injury by a heavy wire guard. The globe can be lowered by a half turn of the thumbscrew at the side, and when pushed back in position is automatically and securely locked. The lamp is only 28 inches long. It can be carried from place to place if necessary, and hung by the metal ring at the top to any convenient hook, or may be permanently fixed in place like an ordinary arc lamp. The lamp can be used on a 110-volt circuit and can be adjusted for 4. 4 5, or 5 amperes, the latter being the standard. Many of these marine lamps have been installed in locations such as those mentioned above, and have given satisfactory service.

Mining Summary.

ARIZONA.

Development continues at the Del Monte group of thirty-seven claims near Harrisburg, owned by the American Exploration Co. A large amount of ore is on the dump.——A number of claims are being developed in Mesquite district, near Yuma. The Bay Horse Co., it is said, proposes to soon run a pipe line to the Colorado river, eighteen miles, and erect a stamp mill.——Last week the new copper smelter of the Azurite Mining Co., near Tucson, was blown in and is turning out eight tons of ingots daily. The company owns a number of claims and has developed sufficient ore to justify immediate erection of a fifty-ton stack in addition to that of thirty tons capacity, which they now have ——Two copper smelters have recently started in Pima county which give a combined yield of ten to fifteen tons of bullion daily. It is believed the Rosemont and Duquesne will be in operation during the year, and the output of both combined will be no less than twenty tons daily.

Globe *Times*: On the Lucky Charlie property, Pinto Creek, a tunnel 240 feet has been run on ledge matter and low-grade copper ore. Ore which assays 16 per cent copper, $8 in gold and two ounces in silver has been found. ——In the Brewery mine development work is 300 feet.——In the Pinto mining claim the assays average 15 per cent copper and $6 in gold ——The Great Republic group has 200 feet of work done.

Bisbee *Orb*: The Cochise Copper Co.'s claims, near Bisbee, have three eight-hour shifts sinking a shaft. Several small bodies of oxide of copper and iron ore have been found the past few days.

Phœnix *Republican*: The Helvetia mine in the Santa Ritas near Tucson was transferred last week to the Calumet-Hecla Co., Mr. T. H. Dwyer of El Paso, acting as agent for the Michigan Co., for $50,000, of which $5000 was paid down. There are twenty-seven copper claims included in the property. Ore in value 40 and 50 per cent has been shipped during the 80's from the Helvetia, and the body to-day shows ore averaging 15 per cent. The Helvetia has been fairly well developed in the past twelve years. The Michigan Co. will put $100,000 in on further development before a plant is established.

CALIFORNIA.

Amador.

A good strike was made in the Valparaiso mine near Jackson last week.——Sinking, drifting and shaft repairing are in progress at the Zeila mine.——Drifting is in progress at the Amelia mine.——The temporary hoist for the new shaft at the Kennedy mine is approaching completion, and sinking is in progress. It is stated that a depth of 3200 feet is to be reached by the new shaft.——At the Amador Queen No. 2 the shaft is down 400 feet below the tunnel level and 740 feet below the surface workings. Sinking continues.

Sutter Creek *Record*: At the Oneida mine near Jackson the shaft is down over 1700 feet. ——The Potazuba mine last week completed a crushing of 180 tons of ore at the Baliol mill; result, $7000—$500 in sulphurets. —— Supt. Thomas has put on a crew at the Central Eureka and will unwater the mine.——At the Wildman – Mahoney the Emerson shaft is down 370 feet. The big reservoir is nearly completed. The company has laid 1800 feet of 22 and 18-inch iron pipe.——At the Keystone at Amador City a 32 H. P. gasoline engine will furnish power to run twenty stamps. The forty stamps are running.——Four men are doing work at the Gover mine near Amador City.

Calaveras.

The Utica mine, at Angels, is running on full time. C. D. Lane, one of the owners, is superintending operations. The company is sinking a shaft between the Madison and Gold Cliff properties for the purpose of working the former, as the old shaft can no longer be used. The new shaft will be sunk 2000 feet.

Mokelumne Hill *Chronicle*: The Moser mine, near Mokelumne Hill, has been bonded to the Demarest M. Co. of Angels, and operations are to begin at once.——Operations have been resumed at the Green Mountain hydraulic mine in Chili gulch.

El Dorado.

The recent crushing of 500 tons of ore at the Sunrise mine, at Kelsey, yielded satisfactory returns.——Unwatering the Grand Victory was finished last week, and as soon as the cold weather is ended the mill will be started up.

Placerville *Nugget*: At Sand Mountain the Blue Bird mine is again started. Their 10-stamp mill is running full time on paying rock, after several years of idleness.——W. H. Hall is opening the Jaspar mine, near Lotus, with good prospects.

Fresno.

Ore in the Copper King mine, thirty miles east of Fresno, is now reported rich enough in gold to pay for the smelting of the copper. The Heiskell copper mine, eighteen miles north from that city, is being developed. Thirty miles from Fresno the Donahoe dredger is now at work.

Inyo.

(Special Correspondence).—The Ratcliffe M. Co. have for some time been developing a property which is yielding fair returns. They have sunk several shafts and opened a ledge that is over 5 feet wide and plates $15 a ton. The company is building a 10-stamp mill, which will soon be in operation. Steam power will be used. The property is near Ballarat. The gold belt that has been opened here in the Panamint mountains is about twenty miles long, and the encouraging prospects are rewarding the people who are developing the mining interests of this section.

Ballarat, Jan. 2d, '99.

Kern.

Chase & Co. have a group of claims near Randsburg in which have been opened paying ledges on each of the claims and on one of them, the McKinley, there are three.——The Little Butte is taking out high-grade rock, which is being worked in the company's mill, and the low-grade is being shipped to Barstow with satisfactory results.——The Ruby mine keeps fifteen men at work and has blocked out about 900 tons of ore which will be shipped to Barstow this month.——The Eureka mill has been running day and night the past month on Panamint, Stringer and G. B. rock, and has turned out several thousand dollars in bullion. The mill is now busy with low-grade ore from the Wedge.——The Cuddeback mill concluded its run last week on fifty tons of Black Hawk ore, which netted about $15 a ton.——Machinery for the big Harrison plant at Panamint is arriving at Johannesburg daily, and from there it is being transported to Panamint by team.——The Johannesburg mill is running on eighty tons of Windy ore, which will probably net $60 per ton.

Randsburg *Miner*: Vice-President Tinker reports the dry concentrator of the Hard Cash near Randsburg a success. The company has bought five additional claims contiguous to the Hard Cash group, which gives the company about 200 acres of mining property in a single group.——De Reamer & Richards are successful in their venture with a cyanide plant at Coso. They have 3000 tons of tailings. Their plant works about eight tons a day and they are clearing $1500 as the result of the first three weeks run. They expect to double their capacity.

Madera.

(Special Correspondence).—The mines of Fine Gold, Coarse Gold and Grub Gulch districts are resuming activity. Assessment work has been thoroughly done.

The Mud Springs mine is sinking below the 400-foot level and is in good ore.——It is reported on good authority that the Abbey mine at Hildreth will be reopened during the coming spring. This mine has produced over $1,000,000. —— The Baker-Henderson mine, near Central Station, has been sold for $8500. Arrangements are being made to resume work at once.——The Waterloo mine at Coarse Gold has started up with twenty men.—— Representatives of a San Francisco company are examining the locations of Aram and Spargur on the Magnet lode, near Central Station, with a view of bonding the property and developing it to a depth of 200 feet.

Gold, Jan. 3rd, '99.

Mariposa.

Mariposa *Gazette*: The Merced G. M. Co.'s mill started up last week and its forty stamps are crushing Mary Harrison ore. It is locally reported that the mine will start up this month.

Nevada.

(Special Correspondence).—There is a reasonable certainty that work will be resumed this spring on the Bullion mines near Grass Valley. The property has been idle eighteen months. It is owned mostly by a San Francisco company.

Work has begun on the Erie Con. mines near Graniteville. The group comprises five claims, one of which was operated through a shaft thirty years ago. The present plan of work will be by tunnel, to cut five parallel ledges at a depth of about 300 feet.

Grass Valley, Jan. 3d, '99.

A company has been organized to develop the Metropolitan mine near Moore's Flat, and work will soon begin.——The new dam near Lowell Hill has been accepted by the U. S. Debris Commissions. It is the property of the Excelsior M. Co. of San Francisco. Everything is in readiness to begin work when water comes.——At Liberty Hill the Liberty Hill mine employs thirty men.

Nevada City *Herald*: At the Eagle Bird, Maybert, mine thirty men and eight power drills are doing development work with encouraging results. In the 300 level they have a ledge 10 feet wide, and at the 600 an ore body was struck recently. This mine is owned by Wilkesbarre, Pa., people.——F. Meister has bonded his claim to a company represented by J. Cohoe. Work will begin on the property at once.——The Gaston Ridge mine, near Graniteville, is running full capacity.——O. M. Eastman struck gravel in his mine.——The Last Chance mine, working under a bond by C. W. Porterfield, is doing development work.——At the Lindsey mine, Maybert, eight men are employed. Chadbourne & Co. of St. Louis are running a tunnel under the old workings which were abandoned fifteen years ago.——Tiernan & Richards have finished another run at the Gray Eagle mine, with good results.

The Grass Valley *Union* says it is locally reported that the Lucky mine, owned by the estate of G. D. McLean, has been sold to E. Creller, who will resume operations upon it in the spring.

Nevada City *Transcript*: Grizzly Ridge district, near Columbia Hill, is receiving new attention in the development of abandoned properties. P. Curnow is taking out good ore.——J. A. Jones continues work with success.——The Grizzly Ridge Co. have encountered a new ledge and have the union of three veins. The tunnel has a depth of 300 feet.—— The Con. St. Gothard Co.'s 20-stamp mill, which was shut down for a few days on account of freezing, is running again.——At the Golconda, Helm, Hothersall & Co. are sinking and drifting.——The upraise in the Live Oak is completed; good ore is being taken out. The ledge is 3 to 4 feet thick.

Grass Valley *Union*: The pipe line from the Spanish mine to the Champion reservoir is completed and the water turned in. It will be utilized for power at the Champion. The pipe line is 3400 feet long.——The price paid for the controlling interest in the Omaha mine to the Empire Co. is locally stated to be $45,000 for 26,000 shares.

Placer.

Auburn *Herald*: Brye, Lozano & Co. have sunk the shaft on the Bellevue 170 feet and have found the same rich shoot of ore they had in the upper levels. They have 125 tons of ore on the dump which will be crushed at the St. Lawrence mill as soon as water can be had. The owners contemplate erecting a mill.——In the Gold Blossom mine, owned by Reed & Wiltsee, the new shaft has reached 437 feet and levels are being driven at 220, 320 and 420 feet. The ore is dumped onto grizzlies, through which the fine dirt drops into a bin below; the balance is put through a rock breaker. From fifty-five to sixty tons of ore are crushed daily and the mill has been running since April 1. Sixty men are employed. The sulphurets are shipped to the Selby Smelting & Lead Co. once a month.—— The Hathaway mine was not obliged to close down on account of the scarcity of water. The drifts are being driven on the 200, 300 and 600 levels. Good ore was recently struck in the 600-foot level. Twenty-four men are on the payroll and the 20-stamp mill is running steadily. —— The shaft at the Marguerite has reached 500 feet depth. At 475 feet a crosscut is being driven.——In the Three Stars mine the shaft is down nearly 700 feet, while a second shaft has reached 300 feet. Machine drills, driven by compressed air, are used and thirty-five men are employed.

Plumas.

From their gravel claim near Quincy, W. S. Bryant & Son in two months took out over $300 in gold.

Riverside.

The old Good Hope mine is said to be again producing rich ore.

San Bernardino.

At Virginia Dale 100 ounces of gold was produced in twenty days from the O. K. mine. There are 800 feet of work done, nearly all in paying ore.——The Rose mine's new shaft at Victor is down over 300 feet and is opened into the 400-foot level of the old works. The management is erecting a cyanide mill with a capacity for sixty tons of ore a day, which will soon be completed.——J. Arbois has a force at work on the Jean mine, in the Virginia Dale district, and is taking out some good ore.—— Reitz & Sherman are running their mill on high-grade ore from the Brooklin.——The Meacham mill is crushing ore from the Noble Grand, and Ferguson's mill on rock from the White Star.——The Deseret G. M. & M. Co. have three mines in working order. They are taking out ore running from $18 to $165 to the ton.——Ore is being taken from the Golden Chariot mine, the Summer Queen and the Gold Belt mines, which assays $235 a ton. The new 2-stamp mill disposes of ten tons of this per day.——J. J. Arbois milled out $1000 in November and December.

San Diego.

The mill on the American Girl mine near Yuma is running on ore yielding from $35 to $40 a ton. This property is owned by a company headed by ex-Gov. Markham.

Shasta.

(Special Correspondence).—The Mt. Shasta mine near Shasta, operated by a San Francisco company, is producing a good grade of ore, most of which is hauled to the smelter at Keswick. The output is large.

Near Keswick a strike of high-grade ore was made last week in the Black Spider mine, which is being developed by local people.

Near Shasta a French company has begun work on the old Phœnix mine, which has a large body of low-grade ore.

Near Whitehouse the Evening Star and Garfield mines are shipping ore by rope tramway to the railroad and thence to the smelter at Keswick.

The outlook for success in mining in this county is encouraging, more so than it has been in twenty years.

Keswick, Jan. 5th, '99.

G Berr is developing the Bavaria and Old Aunt mining claims near Redding. Last week he shipped a carload of ore to the smelter at Keswick.——The new quartz mill on the Washington mine at French Gulch started up last week, crushing rock for leasers. There are about 400 tons of ore on the dump.—— On the Bunker Hill mine near Shasta work of new discovery and development is going on.

The Marina Marsicano Co., composed mostly of San Francisco men, that bought the old Sunny Hill mine and resumed operations, is pushing work in reopening the old property. They have found an ore body and made a two-carload shipment to the Selby smelter. The ledge has been exploited for 300 feet.——The Mount Shasta mine, near Shasta, employs fifty men. The ore is hauled to the smelter at Keswick.——The Salt Creek mine is being extensively developed; twelve men are employed.

Sierra.

B. H. Brown & Co. are making progress at their claim at Chaparral hill. They have the mine timbered in 200 feet, and there remain 100 feet of the old tunnel to be cleaned out.

Downieville *Enterprise*: Fifteen men are employed at the Oriental mine near Alleghany. Work is being pushed. A pump capable of raising 30,000 gallons per hour has been placed.——L. M. Bovee struck an encouraging prospect in his claim near Alleghany.——The Good Year M. Co., near Downieville, has not yet paid the lien-holders, who have over $5000 in judgments against the property. Ten of the lien-holders, under A. Bergen, are doing the assessment work to protect their judgments.——The Cayot Con. quartz mine on Fall river has been bought by a San Francisco company. The new owners intend building a mill soon.——At Forest City, in the South Fork mine good progress is being made.

Siskiyou.

Yreka *News*: On the Commodore mine, near Yreka, tunnel No. 3 is being extended. Sufficient ore is being taken out to keep the 6-stamp mill running.

Yreka *Journal*: J. W. Downing has bought C. Coles' interest in the Klondike mine, near Yreka, and will put men at work.——The Roberts & Jillson mill is running day and night. ——A company has men to work at the Black Jack mine.——J. & G. Main have the Horn mine for next season.——J. Reeder of Fool's Paradise struck a 4-foot ledge in his mine that goes $20 per ton.——The Miner and LaFlesh mill has shut down on account of the water being frozen.——The claims near Honolulu are paying. The China claims will continue work until the high water drives them out.——Jillson & Roberts have been short of water at their quartz mill near Henley, owing to cold weather, and are running five stamps.——The river miners on the Klamath are unable to do much work on account of the cold weather.

Trinity.

W. R. Thomasson of Igo has bought the property of the Squirrel Gulch Placer G. M. Co., near Trinity Center. The property is said to yield from $8 to $10 a day per man.

Tuolumne.

The Merced M. & M. Co. have put an injunction on the Shawmut-Eagle Co., at Jacksonville, and stopped progress on the big ditch, which was being cleaned and repaired. There are gravel deposits in this section that could be worked if this ditch could be opened up, and numerous small placer claims could be worked, and a number of low-grade quartz mines could be operated that cannot be profitably worked by steam power.

Jamestown *Magnet*: At the Columbia E. & T. Co. near Columbia progress is made; bottom of the gravel bed has not yet been reached. The company is satisfied with the prospects.——At the Anaconda mine sinking has resumed.——Good rock has been struck in the old Experimental mine near Columbia. ——Five men were put to work at the App mine last week. It is calculated that it will take ten days to unwater the mine.——During the idleness of the Santa Ysabel mine, caused by the lack of water, development has progressed. A body of ore has been opened on No. 4 level of No. 1 shaft.——In the Dutch mine on the 8th level they are stoping in the new ore body. The mill is running steadily on a fair grade of ore, steam power being used. The management has decided to add twenty additional stamps, making a total of forty. It has also been decided to use electricity for power as soon as the Tuolumne Power Plant Co. starts up. Supt. Trittenbach is shipping three carloads of sulphurets monthly.——The Mexican Co. is preparing to develop its mines at Big Creek on an extensive scale. The new machinery will soon be in working order.—— The Elgin mine is being worked by the Argili Bros. A large arrastra has been erected.—— At the Longfellow mine the mill will soon be running again.——At the Big Oak Flat mines Nos. 1 and 2 a new 10-stamp mill is being put up. A new shaft is being sunk on the No. 2 and a body of sulphuret ore is being opened up. It is locally stated that ten stamps are soon to be added.——In the Gold Bug mine the ledge is 9 feet wide and will average $6 per ton.——Butternut & Gillespie, in the Boynton mine, have a 24-inch vein that gives an average mill test of $20 per ton.——In the Grapevine mine a chute of mill rock has been opened.——The Hall Bros., from a mill test of twenty tons, obtained $7 a ton in gold and $12 a ton in sulphurets. They have a 3-foot ledge. ——At the Dreisam mine, Arrastraville, they are putting in an air compressor. The company is also putting in water power. The mill is awaiting water.——Work at the Trio mine was resumed last week after a two weeks' shutdown.

Sonora *Independent*: In the Sunshine mine near Sonora the lower tunnel has been driven in 146 feet and the upper one 126 feet. The surface ore assays $11 per ton.——At the Bluebell mine a body of ore which prospects well has been struck.——At the Bonita mine near Grizzly, owned in part by the Fair estate, operations will begin April 1st. They will sink and tap the vein at depth.——At the Goldwine mine the tunnel is in 800 feet. The owners contemplate building a mill next summer.——At the properties of the Ribbon Rock M. Co. the lower tunnel has been run 900 feet. ——Twenty-five men are doing development work at the Grizzly. The 20-stamp mill is running day shift.——Local report says that the Seminole group of mines will put in a new mill this summer.

Sonora *Democrat*: The Philadelphia gravel mines will be started up this month. The new ditch, almost completed, has cost about $25,000. —— The new mill on the Densmore near Columbia is ready for starting up, awaiting water.——At the Buchanan mine eighteen miners are at work. The shaft is down 450 feet.——At the Republic two shifts are drifting at the 200 level. The shaft is down 270 feet.

COLORADO.

BOULDER COUNTY.

The Boulder County mine, near Nederland, was recently sold to the London Expl. Co., for $250,000.

CLEAR CREEK COUNTY.

The Griffith mine, near Silver Plume, shipped about 100 tons of ore last week. The Maxwell & Hood portion of the mine has about 50 feet of ore stripped for a height of 10 or 12 feet, which is about 18 inches in thickness. The mine gives employment to fifty men.——Ore running six ounces of gold to the ton is being taken out of the Gold Dirt mine at Empire.

EAGLE COUNTY.

Ore shipments last week from Red Cliff were nine carloads, making a total for the year of 413 carloads.

EL PASO COUNTY.

The December output from the Modoc, at Victor, is estimated at forty carloads of ore, ten of smelting grade of 7½-ounce value and the remainder about two ounces to the ton. ——Last week a strike was made in the Legal Tender of the Golden Cycle Co. at Goldfield at depth of 600 feet. The vein is 3 feet in width and carries an average value

of two ounces a ton.——The Ocean View, near Victor, has been leased for twelve months for $30,000 to Cummings & Co. An electric hoist will be put on the claim immediately.——The gross value of ore produced the past year from the Hull City Placer is officially placed by the management at $744,760.98, the net smelter returns $581,935.30, and the amount of royalty paid to the company $158,135.19. Dec. 22, the cash on hand amounted to $71,000.

GILPIN COUNTY.

The Denver mint reports the value of bullion received from Gilpin county for the year up to Dec. 23rd: Gold, $732,749 51; silver, $4640 36; total, $737,389.87.——The shipments of smelting ore from Central City for the year were 3587 carloads of ore. Rating the cars at fifteen tons each, there were shipped 53,805 tons.

HINSDALE COUNTY.

Lake City *Times*: Last week an 8-inch streak of copper ore was uncovered in the Cherokee group near Lake City. Six men are at work.

LAKE COUNTY.

On the Vivian shaft of the Nisi Prius M. Co., Leadville, a large body of lead carbonate has been opened up, the grade of which is about $12 net from the smelter.

Seven thousand tons of argentiferous iron, lead carbonate and lead sulphides were shipped the past year from the Carnahan and Keith lease claims of the Iron Silver Mining Co.——The Maid of Erin Silver Mines Co., owning the Henrietta and Maid of Erin, and working the Brooklyn, Clontarf and Moyamensing claims of the Adams M. Co., under lease, produced, during '98, 33,000 tons of ore. This ore is of greater variety than that produced by any other mines in the district, consisting of oxide iron, lead carbonate, iron and copper sulphides carrying values in gold, silver, copper, lead and iron. The lessees are conducting all operations above the 700-foot level.

Leadville *Miner*: Near Leadville the Maid of Erin Silver Mines Co. has resumed work and is shipping 3500 tons per month, worked on the tribute system. The Morning and Evening Star consolidation is worked on the same system, with eighty men employed. The Catalpa Mining Co. is shipping heavily, both steel and fluxing iron.——The Ibex Mining Co. has marketed 100,000 tons of dry, siliceous and iron sulphide ores the past year which carries gold, silver, lead, copper and iron. Two-thirds of the large force is engaged in development and one-third in producing ore. The payroll carries 500 names. The building of the Rio Grande to the mines will cheapen transportation.——The Resurrection G. M. Co. owns more than 500 acres of patented ground. It is shipping 150 tons daily. The D. & R. G. Railroad has been extended to the mines.——From the Little Ellen mine forty tons daily is shipped.

Leadville *Chronicle*: The Ruby mine at Weston Pass is shipping fifteen tons daily of iron ore.——If the pumps at Leadville succeed in lowering the water another 140 feet in the Penrose shaft, the pumping proposition will have been solved. At that point below the present water line are the submerged station pumps, and with those in action in co-operation with the present operating pumps the water can be handled.

Leadville *Miner*: The Ballard group of mines in December marketed $25,000 worth of ore.

MINERAL COUNTY.

Last week the ore shipments from Creede were 149 cars, 2831 tons.——The output for Mineral county for the year ending Dec. 31st, '98, was 111,712 tons. The value of the output was as follows: Silver, $2,396,100; gold, $97,660; lead, $534,205; zinc, $2,000; total, $3,047,955.——J. W. Westlake is pushing work on his Last Chance lease, which is outputting forty tons per day.——The Commodore mine, to transport its output to the smelters, uses fifty ore cars of twenty-five tons capacity. There are 300 miners employed. The tram is run night and day and handles 300 tons of ore every twenty-four hours.

OURAY COUNTY.

It is locally reported that the assignees of the Cleopatra M. & M. Co. at Ouray, are making arrangements to start up the plant. The intention is to clean up the ore on hand, and if the operations warrant they will continue work.——The Camp Bird mine near Ouray put in running order a tramway two and one-half miles in length.

SAN JUAN COUNTY.

Silverton *Standard*: The Ridgway mine, near Silverton, produced in 1898 about $30,000.——The Iowa mine last year milled 27,000 tons of ore, the output of concentrates from which amounted to $295,000.——The Silver Lake mines employ 200 men; they break and mill about 600 tons of ore per month. The tramway has been extended an additional 6000 feet and delivers concentrates from the mill to the railway, 14,700 feet.

SAN MIGUEL COUNTY.

Telluride *Examiner*: The Tomboy mine at Telluride has a force blocking out a portion of ground in the lower level, where an electric hoisting plant will be installed. This accomplished, the company will begin sinking from this level on the vein for exploitation purposes. The mine is easily furnishing all the ore the mill can handle.——The Euclid Avenue M. Co.'s mill started last week on a run of Euclid Avenue ore. The mill is equipped for handling eighteen tons every twenty-four hours until spring, at which time it is the intention to increase its capacity commensurate with the output of the mine. A large two-bucket tram has been built between the mine and the mill. It is a gravity tram, with capacity of about three tons per hour. It is one span, 2700 feet long, the longest single span in Colorado. The Euclid Avenue property consists of five claims. It has a 4-foot vein of ore with 2 to 2½-foot pay streak. A mill run of 100 tons of the ore, made two months ago, plated $15 a ton and yielded a good grade of concentrates.

The Silver Pick mine, near Telluride, in 1898 produced seventy-five cars of concentrates of from ten to twelve tons each and twenty-two cars of crude ore of like tonnage. Each ton of these concentrates contained four tons of crude ore ranging from $40 to $80 a ton in value.——The Nancy Hanks mine at Saw Pit is shipping five cars a week to the smelters.

IDAHO.

S. I. Silverman & Co., who lately bonded the Jumbo claim at the Hump, have let a contract for a 200-foot tunnel and crosscut, work to be started immediately.

At Hailey, the sale of the Cræsus group of mines was made last week for $80,000. The purchasers, represented by W. G. Page of Spokane, are said to be Spokane and Nebraska capitalists. This property in the early eighties was operated for a time, but on account of the crude method of treating the ore, was not a success. It finally passed to H. Lewis, who developed it, uncovering large bodies of ore.

The Jumbo mine, in the Buffalo Hump district, was sold recently to Spokane men for $75,000, of which 12½ per cent was paid down.——Baird, Williams & Rice sold a Buffalo Hump prospect for $6000 cash.——The Big Buffalo is in litigation.

Several big placer mines are being operated on the Snake river, the largest of which is the Cariboo mine, Bingham county, owned by Thomas & Son of Chicago, who are said to have taken out $35,000 this season in eight days. They have twenty-eight miles of ditches, control about 10,000 acres of placer ground and have 10,000 feet of iron pipe, using eight nozzles. Their gravel runs from 6 to 20 feet in depth.

Near Kendrick, E. Johnson bought a half interest in the Mongrove claim. From a mill test of eleven tons he netted $1300. Fourteen men are developing the mine.——At Burke the Mammoth's air compressor will be ready to run Jan. 15th.——At Boise, the strike in the Checkmate mine, at a depth of 250 feet the vein shows ore worth $100 in gold per ton.

Near Lewiston the Iron Crown mine has 200 tons of ore ready to be milled, which will go $50 a ton. The mill is closed down on account of the freeze-up. The company of which W. H. Walp is Supt. contemplates before spring to put in a crusher and new mullers.——Near Moscow a strike was made last week in the Golden Gate mine of a ledge 4 feet thick of high grade ore.

Wallace *Free Press*: The year '98 was a prosperous one for the Cœur d'Alenes. The ore and concentrates shipped during the year will not miss 150,000 tons by many pounds. This mass of ore yielded approximately 180,000,000 pounds of lead, 90 per cent of which the smelters paid for an average price of about $3.60 per cwt. Besides this the mine owners were paid for 4,500,000 ounces of silver at an average price of within a cent or so of 60 cents per ounce. This would make a grand total of $8,000,000 as the output of the district. Of this amount $3,000,000 went for freight and smelter charges, $2,500,000 was paid to the miners as wages and the other $2,500,000 went for repairs, machinery, development work and dividends.

Wallace *Press*: The Tiger-Poorman mine, which made Burke and has kept the town moving in the dullest times, has reached 1800 feet depth below the apex of the ore chute and shows no signs of failure, but is turning out better ore than at most of the higher levels.——The long tunnel upon which the Bunker Hill & Sullivan M. & C. Co. is working is to run to the large ore bodies upon which this company has been working for years, and which have been producing from 500 to 800 tons of ore daily for years past, cutting them 700 feet below the deepest point which has yet been reached in them. This tunnel will be about two miles long and will have cost upwards of $200,000. More than one-half is done. New machinery has been added to the mill costing $50,000.

MONTANA.

The November output of the Montana M. Co., Butte, was 4090 ounces of gold and 20,540 ounces of silver, from 7050 tons of ore crushed and 11,337 tons of tailings from the dams. The tailings plant closed for the winter Dec. 1st. The value of bullion from the 11,337 tons of tailings was $49,100 and the cost of treatment $16,032. The total bullion produced is valued at $93,900; the expenses were $60,800, leaving a net profit of $33,100.

Clancy *Miner*: Butte people have taken a bond on the Golden Gate property near Clancy and will put up a steam hoist and sink the shaft an additional 200 feet, which will make it 400 feet. The Golden Gate is generally regarded by mining men as a good property, and has shipped considerable ore in the past.

NEVADA.

The Cuyahoga M. Co. of Cleveland, O., has bought the Little Bonanza group of gold mines in Alkali district in Smith valley, Lyon Co., for $5000.——The Eastern Slope Gravel M. Co. have taken up eight miles in claims in and about Silver King valley. Tunnels are being run and cabins, roads and a ditch are being built.——The Dexter of Tuscarora last week made a shipment of gold bullion and another of auro-cyanides that amounted to $4000, the result of a run with five stamps. The starting up of the forty stamps is promised within twenty days.——The Comstock Pumping Association the past week has been stripping the pump compartment of old air and small hydraulic pipe. This work is nearly completed. The pump bob on the 1750 level is being taken out and the station repaired. The pump hoist is being put in condition for heavy work. One of the compressors is being prepared for work and all steam pipes in use are being covered. The temporary bulkheads put on the 1650 and 1750 levels are found to be effective.——At Pioche in the Horseshoe claim work is meeting with success and will be continued all winter, and suitable reduction works will be erected in the spring.——J. S. Laken made the final payment on the property of the Tuscarora M. Co. at Tuscarora, amounting to $15,000. The company will sink to a depth of 300 feet and will push the work.——At Ely miners were put at work in the Robust mine last week and sinking the shaft has resumed.——M. Davis has secured a lease on the old Chainman mill and the stamps will be dropping probably within two weeks. A boiler and engine are being installed to furnish power. The cyanide tanks will also be put to use.

NEW MEXICO.

The Copper Hill Co., operating near Rinconado, is working twenty men. The vein is 8 feet wide. The average value is said to be $40. The company contemplates erection of a plant for treatment of the low-grade ore.——The St. Louis United Copper Co., operating near El Paso, is making regular ore shipments to the smelter.——The Cullen mines, near Golden, are shipping regular to the Graves mill.——There are 1000 tons of ore on the dump.——At Socorro the Timber Peak M. Co. has eleven carloads of machinery on the ground for their new Water canyon mill. The process to be used will include both amalgamation and cyanide and the daily capacity will be 150 tons.——The Santa Rita Copper & Iron Co. is shipping five cars of iron ore per day.

Ashton & Roach, leasers on the Romero, are making shipments to the Silver City smelter.——In the Aztec, at Elisabethtown, a 12-foot vein has been found which runs from $8 to $100 per ton. Twenty stamps are at work on this ore.

OREGON.

The Rose Valley Borax Co. has incorporated. The borax mine and works are in Harney county, the headquarters in Reno, Nevada. R. M. Fulton is secretary.

Near Grant's Pass the quartz mine recently developed by Knight & Co., was sold last week to Berry & Rolfe for $2000 cash. The new owners will erect a cyanide plant which will be operated with a new extracting compound, instead of zinc filings as used in similar plants.

Near Baker City, on the Magnolia mine, a chute of ore has been found, exposing 14 feet of ore, 4 feet of which averages $60 per ton. Assays range from $30 to $250 a ton. Fifteen men are employed and development is being pushed.

Baker City *Democrat*: The Deer Lodge M. Co. near Baker City is pushing development work with a view to erecting a big mill plant in the early spring.——Representatives of capital, with a view of introducing dredgers on the gravel beds of Baker and Grant counties, are in Baker City.——It is locally said that the E. & E. mines have adjusted their financial complications. There has been no cessation of operations.

Baker City *Republican*: The Richmond mine near Baker City, consisting of seven claims, has been sold to a French company of Montreal, Canada. E. D. LeClare is Gen. Mgr. The company contemplates erecting a mill in the spring.

Sumpter *News*: D. Weaver, in his Golden Gate group of mines near Robinsonville, is taking out good ore. He has three ledges, one of which is 28 feet wide and assays from $8 to $10 per ton in free gold; another is 4 feet and yields about the same.——The Banzette mine is under lease to Osborn & Co., who are taking out good ore.——Powers & Co. are developing the Tiger mine.——Kelly & Cradlebaugh have a force working their Imperial group.

SOUTH DAKOTA.

The Golden Gate Co., Blacktail district, are daily shippers of twenty tons of ore. Extensive works are planned for this property. Twenty-five men are employed.

At Ragged Top were sold to the American M. Co. nine mining properties for a total of $194,500, payable Dec. 16, 1900. The company will begin work at once. Hoisting machinery will be put in of sufficient capacity to sink 1200 feet. The hoist and boiler will be of 150 H. P. capacity. There is no water in the Dacy shaft at its present depth, 430 feet, but the company expects to put in pumps and air drills later. D. S. Kilpatrick is Pres. of the company.

UTAH.

The South Eureka, at Mammoth, will at once begin sinking the shaft to a depth of 1000 feet.——Recently C. M. Henrotin and his Chicago and Salt Lake associates secured a bond on the Deseret G. M. & M. Co.'s mine in Piute county. Last week the bond, $100,000, was taken up.

Ore shipments from Park City last week were 1,155,830 pounds.

The Park City *Record* learns that the Daly-West Co. has decided to start the mine up with a full force, the long-deferred reconciliation between the incorporation and those who refused to go on with their half of the property has been practically adjusted.

G. B. Langley of Millerville, N. J., bought a half interest in five claims near Bingham for $9000.

Ore running 30 per cent copper, $5 in gold, 35 per cent lead and some silver is found in the Star Con. M. Co. at Tintic.

The Old Telegraph mine at Bingham is shipping 300 tons of first-class ore.——At Sunshine the Sir Victor group consisting of five claims was sold under bond to B. T. Lloyd for $50,000.

It is estimated that about 110,000 tons of ore have been put through the crushers at the Manning mill near Mercur during the year and that the product amounted to $500,000 in gold.——Tanks to increase the capacity of the Daisy mill fifty tons are being built.——The Cannon ground at Mercur was bought last week by J. Dern and associates for $150,000.——Immediately after the transfer arrangements were begun for the incorporation of the property under the name of the Ingot G. M. Co., with a capitalization of $350,000.

At Silver City last week ore was discovered in the property of the Four Aces which assayed 8.2 per cent copper, twenty ounces silver and 40 cents in gold ——In the Alaska at Tintic ore has been exposed at 500 feet depth.——The Lower Mammoth, Tintic, made a good strike in the shaft from the tunnel level at a depth of 500 feet. Samples put through the furnaces show 130 ounces silver, 30 per cent lead, 15 per cent copper and $3 in gold.——The production of ore has begun at the property of the Cuba Co. at Bingham and the first shipment has been made. The ore carries silver, gold and copper of the value of $40 per ton.——The Joe Bowers Extension Co. at Eureka contemplate placing a steam hoist. Their shaft is down 300 feet and crosscutting shows a 40-foot vein, with 18 inches of high-grade ore. Sinking the shaft from the 300 level will be resumed immediately.——The Golden Gate mill at Mercur will be ready to begin operations early next month. Meanwhile the old mill is handling about 300 tons a day.——At Vernal the Uintah Summit is making preparations for extensive shipments and contemplates putting twenty four-horse teams on the road to transport the ore ninety miles to the railroad. The ledge is from 6 to 14 feet. The two carloads that have been shipped returned copper 50 per cent, gold $6, and silver sixteen ounces to the ton.——The Geyser-Marion at Mercur employs 100 men. An average of over 150 tons of ore is going daily through the crushers.——W. A. Clark of Montana, who recently paid $75,000 for the Ophir Hill mine and mill at Ophir, will soon begin the erection of a pyritic smelter. The crude ore in the mines there that has been handled by the former owners in the form of a concentrate contains, on an average, eight ounces silver, 25 cents in gold, 5 per cent copper. Further analysis shows 8 per cent zinc, 20 per cent iron, 20 per cent silica and 40 per cent sulphur.——The Martha Washington M. Co. at Silver City will put in a pump and continue the shaft to a depth of 350 feet.——In the Bullion-Beck at Eureka a streak of good ore has been exposed.

WASHINGTON.

At Republic the Republic M. Co. is erecting an experimental plant for the treatment of tailings. Tanks are being built to receive the tailings direct from the large mill.

Near Tacoma a strike was made at the Leola copper mine recently of a 5-foot vein of ore, which runs 20 per cent copper, twenty ounces of silver and some gold to the ton. The property is owned by Tacoma capitalists.——Extensive placer mining is being conducted on Snake river, though few claims are regularly located, as the gold is found chiefly in small bars that produce about $500 each. This mining is carried on for hundreds of miles on Snake river. Several hundred miners were engaged this year, making from wages up to $20 a day. The Klondike rush caused many Snake river miners to leave, but they are coming back.

WYOMING.

Lander *Clipper*: The Carissa mine, near Lander, is producing good ore. The 10-stamp mill is nearly completed.——The Empire State mine is extracting some fair-grade ore.——The St. Louis mine is being worked under lease by Westfall & Co. The vein is 2 feet wide.——Ferris & Deal last week bought a quarter interest in the Rufedeha copper mine at Battle Lake for $35,000.——Culleton, Nichols & Co. are going in on a vein of copper 8 inches wide of a grade that will pay to mill.——The Charter Oak is getting out a good grade of ore and will soon be producing enough to supply a reduction plant of their own.

FOREIGN.

BRITISH COLUMBIA.

For the half year ending Dec. 31 the Slocan ore shipments will total 18,000 tons, valued at $2,000,000.

The North Star mine, near Fort Steele, a silver-lead property, comprises about 850 acres. Development consists of 1800 feet of 1800 feet of tunnels, shafts and drifts, and about 1200 feet of this is in solid ore, showing a large amount of galena lying nearly flat on a diorite footwall, which carries from 40 to 60 ounces in silver and will average 60 per cent lead. On the Stemwinder, one of the company's claims, a tunnel is being run to tap the ledge at a depth of 1000 feet. The tunnel will be about 4000 feet long.

LOWER CALIFORNIA.

From Ensenada was shipped recently $2300 in gold bullion.——M. Phillips of San Bernardino county has bought an interest in the Juarez placer mines on a valuation of $40,000 for the property. The hydraulic plant on the property cost $12,000. The Piramide Co is also hydraulicking and a third company is working. The placer ground is extensive and averages well.——The Fortuna G M. Co has determined to reopen its mines at Agua Dulce. The 10-stamp mill was started last week. A number of Eastern people interested make complaints that these mines had been operated for stock jobbing and not for legitimate mining. The mines consist of the Fortune, Tesoro, Guadalupe and other properties, which are considered profitable if handled properly.

MEXICO.

The Carmen mine near Hermosillo is working on a vein 4 inches wide of ore running 200 to 300 ounces of silver to the ton.——The Purisima has various veins—one a foot wide running 1000 ounces and another with 200 to 250 ounces of silver to the ton.——La Cruz has been running on ore paying 2400 ounces.

ONTARIO.

The Sultana mine near Rat Portage is locally reported to have been sold by J. F. Caldwell to a British corporation for $2,250,000. The property comprises seventy acres. At 350 feet depth the ledge is said to be 30 feet wide and from top to bottom averages $7 a ton.

Industrial Notes.

—An iron smelter and foundry is talked of at San Diego, Cal., in connection with the new Japan-China steamship line.

—The City Hall Commission has resigned. The City Hall was to cost $1,000,000. The corner stone was laid Feb. 22, '71. The total cost to date of the building is $5,723,794.18.

—The Los Angeles, Cal., Oil Producers' Trustees ceased operation on Dec. 31. The oil in storage —70,000 gallons—has been turned over to the Oil Storage & Transportation Co.

—The Los Angeles & Pasadena, Cal., Railway Co. has been bought by the Southern Pacific Co. for $1,000,000. The road consists of forty miles of track; extensive improvements will be made.

—San Francisco mint coinage for December, '98, was the largest ever recorded: Double-eagles, $8,053,500; eagles, $690,000; half-eagles, $502,500; half-dollars, $16,000; dollars, $800,000; total, $10,062,000.

—It is understood that the Union Pacific and the Oregon Short Line are back of the Utah & Pacific, and are engineering its way through to the Pacific coast, Los Angeles, Cal., being the presumable objective point.

—During '98 twenty-eight sailing vessels, representing 3506 tons; fifty-seven steam vessels, with a tonnage of 18,564; sixty-two barges of 6704 tons, making a total of 147 vessels and 28,774 tons, were built in the State of Washington.

—The Pittsburg Reduction Co., has a telegram from the Standard Electric Co. ordering 180 more miles of aluminum wire, additional to the first order. This last order will comprise about 240,000 pounds and will cost about $60,000. The company is building an electrical power plant at Snoqualmie Falls, Wash.

—The Krogh Manufacturing Co. of San Francisco suffered severe loss by fire on the 1st inst., their newly fitted up establishment at 9-17 Stevenson street being destroyed. The loss is estimated at $30,000. The firm will continue manufacturing pumps and hydraulic machinery as soon as a new outfit can be set up and, meanwhile, go on with the business at their other establishment, 136-140 Main St., San Francisco.

—In connection with the picture and data of America's biggest locomotive on pages 14 and 15 is interesting to note that on the night of the 2nd inst. began a contest to last for a week between two big locomotives with 7-foot drivers, owned by the Chicago, Burlington & Quincy Railroad and the Chicago & Northwestern Railway, for the fast mail contract between Chicago and Omaha, the prize being the contract for carrying the Oriental mails between Chicago and Omaha, estimated to be worth $1,000,000 a year.

—The progress of manufactures in California is shown in the following:

	Employes.	*Wages paid.*	*Value of Product.*
1860	6,400	$ 5,550,000	$ 23,500,000
1870	25,400	13,136,722	66,593,556
1880	43,700	21,065,905	116,2 8,973
1890	71,000	35,000,000	165 000.000
1900	75,000	38,000,000	190,000,000

—Gen. Mgr. Nevin of the Santa Fe states that through trains from Los Angeles to San Francisco will not be operated on the Valley road until the line has been completed from Stockton.

—Not since the American occupation was there so dry a year in California as '98. Yet, during the past year that State produced of wheat, 5,800,000 centals; wine, 19,000,000 gallons; wool, 26,000,000 pounds; canned fruit, 2,000,000 cases; oranges, 4,640,000 boxes; raisins, 70,000,000 pounds; beet sugar, 55,000,000 pounds; hops, 8,000,000 pounds; dried apricots, 5,500,000 pounds; dried prunes, 70,000,000 pounds; dried peaches, 6,000,000 pounds; made interstate shipments of fresh fruits, 110,000,000 pounds and interstate shipments of dried fruits, 115,000,000 pounds. The exports from San Francisco aggregated $40,000,000.

—Gen. Mgr. Sinclair of the Southern Cal. Power Co., estimates 50,000 H. P. possible of development from mountain streams between San Bernardino mountains and the ocean, not including the Kern river plant. His company is about ready to generate nearly 5000 H. P. The San Gabriel Power Co.'s plant is completed. The Redlands Co. is extending its plant to about double its present capacity. Below the Southern Cal. Co.'s plant A. G. Hubbard is at work on another plant, and below this plant preliminary work is being done on a third. In Lytle creek work is under way on another plant, and two other systems are proposed for the San Gabriel river.

—According to a contemporary, constructors and shipbuilders throughout the East have been investigating the cause of the remarkable record of the Oregon, Olympia and Farragut, and say they have at last found out why these vessels are superior. They were built in a climate of little variation. The thermometer seldom goes below 58 in San Francisco, and seldom above 78. Its normal range is from 58 to 68. Delicate parts of a steamship built in such a climate at different times of the year do not suffer from expansion and contraction, caused by heat and cold. That is, parts of the ship built in summer and in winter fit. Two delicate pieces of mechanism or two plates for the hull, the one built in the winter and the other in summer, are of the same size, and when placed in the ship they expand and contract with heat or cold to the same degree. That is, the variation of climate is so little that the expansion or contraction of the steel is the same the year around, or so very near the same that no difficulty is experienced. In Wilmington, Del., where the Cramps are located, the variations of the thermometer are more than 100 degrees, from zero to 104. It may thus be seen that machinery constructed in the winter at zero would not fit that constructed in the summer at 104 above. The pieces which are delicate, notwithstanding their great weight, will not fit. This is a recognized principle among Eastern shipbuilders. They have never been able to figure the contraction and the expansion to such a nicety that they could overcome the bad results.

Personal.

S. W. DORSEY is examining mining property near Phœnix, Arizona.

E. M. RAY becomes Supt. Hull City P. M. Co., Cripple Creek, Colo.

J. J. CRAWFORD has returned to San Francisco from El Dorado county, Cal.

J. BRESNAHAN succeeds J. P. Harvey as Supt. Republic mine, Republic, Wash.

J. W. FRANCK, a mine owner and operator of New River, Cal., is in San Francisco.

W. J. SUTHERLAND, Pres. Holmes M. Co., Candelaria, Nevada, is in San Francisco.

JOHN HAYS HAMMOND prophesies that Africa's gold yield for '99 will be $100,000,000.

C. W. GOODALE is now in charge of the Great Falls smelter of the Boston & Montana Co.

H. A. HOWARD is appointed Gen. Mgr. Fortuna G. M. Co., Aqua Dulce, Lower California.

F. W. WILMANS, Pres. Rose Creek M. Co., Sonora, Cal., has returned from San Francisco.

L. C. PARKE, mining engineer, has removed his office to the Claus Spreckels Bldg., San Francisco.

GEO. MAINHART, Grass Valley, Cal., owner Erie Con. mines, Graniteville, Cal., is in San Francisco.

T. A. RICKARD, State Geologist of Colorado, is visiting San Francisco with his bride on their wedding trip.

C. A. HAMILTON of San Francisco is examining copper properties in Shasta county, Cal., for New York capitalists.

CHAS. HOFFMAN of Oakland, Cal., has charge of an engineering corps, who have started on a scientific prospecting tour on the West African coast.

G. KARTSCHOKE, Pres. Champion M. Co., Nevada City, and Vice-Pres. Con. St. Gothard M. Co., Columbia, Cal., is visiting both mining properties.

J. P. HARVEY has been appointed Gen. Mgr. of the Clark mines in Republic, Wash.; the Republic, Jim Blaine, Lone Star, Rebate and Number Six.

NORMAN A. ROOT succeeds D. B. Hanson as San Francisco agent of the E. P. Allis Co. The latter will in future represent the company at Seattle, Wash.

MAJ. MYERS, Pres. Siskiyou Co, Cal., Miners' Association, speaking of the outlook in his section, says: "Mining has never been better in Siskiyou. There has been more earnest work than in years. We have practically given up tunneling and scratching the mountain sides, and are going in for sinking and deep mining. The scarcity of water has driven the hydraulickers into the mountains, and they have made the change in their style of mining pay. Eight or nine years ago tracts which were as barren as a marble floor are now covered with mining villages, and stamp mills are being erected everywhere. We are getting down to ore bodies. We never went down at all before. If this season is wet, as we hope it will be, there will be abundance of power, and a great number of new mines will be opened, so that our output will be extraordinary. On the Klamath and Scott rivers the copper veins, sulphides, are being developed, and we are going to have another Anaconda there. Smelters will be necessary, but when the mining men see that we have in the shape of copper as fine as any in Butte, they will put up the smelters."

DWIGHT L. CLOUGH, the electrician who was recently reported to have survived a shock from an electric current of 11,000 volts received at the power house of the Lockport, N. Y., railway, has recovered sufficiently to be able to tell how it feels to be struck by a strong current of electricity. He says: "The report given out that a current of 11,000 volts passed through my body was erroneous. The correct measure of the current was 1000 amperes under a pressure of between 800 and 900 volts. You see the ampere is the measure of volume while the volt is the measure of pressure. With this correction, however, it remains a fact that the chance of living after such a current goes through one is about 1 in 100. As to my sensations, I had none. I was filing a brush ring on one of the converters. I stood on a rubber mat to insulate myself, as the machine was running. Unnoticed by me, the mat slipped about, and in changing my position a little, I slipped with one foot into the well under the machine. That threw me against the machine and my foot came in contact with the machine frame, completing the circuit. I saw a blinding flash which seemed to play about my wrists. There was an explosion. I was lifted from the floor an instant and then was hurled back. I was conscious all the time and knew what had happened, but I felt nothing. Apparently every nerve and function of my body except the brain was for the moment paralyzed. I lay for a few moments and then managed to get to my feet and attempted to get to the door, but I seemed unable to control my movements and feet again, this time losing consciousness. The next I knew was when I regained my senses for a time in my room in the hotel." He was badly burned about the hands, arms and ankles.

Calendars.

IN these progressive days, when everything published is artistic, combining the useful and ornamental in an eminent degree, it is interesting to note the elaborate way in which so many trade accessories are produced. In calendars, the one received at this office from the Gates Iron Works, Chicago, Ill., is a thing of beauty and a joy for—as long as one wants to use it, indicating the day of the week and month for 100 years, with a striking scarlet and silver face, and no more advertising thereon than is justified by the facts. Though they don't say so, it is possible that a request to the Gates Iron Works, 650 Elston avenue, Chicago, might secure one.

THE Wm. Powell Co, 2525-2531 Grove avenue, Cincinnati, O., send the prettiest catalogue received from that section. It is for '99 pure and simple, and incidentally advertises that firm's regrinding star valve. As in the preceding case, it is likely that the Wm. Powell Co. would send one of these handsome catalogues to any one asking for it.

Commercial Paragraphs.

THE Abner Doble Co. of San Francisco has a contract for the hydraulic installation for the Mount Whitney Power Co., Visalia, Cal. It consists of three 700 H. P. steel wheels, cast iron housing, direct connected to three alternating current generators, running at 514 revolutions under a head of 1300 feet. The Abner Doble Co. will also furnish the cast steel pipe. The weight of the pipe will be about 60,000 pounds.

THE Truax Car Co. of Denver, Colo., has established a branch plant in San Francisco, for manufacturing its ore cars. These are in great demand on the Pacific coast, and the new plant, fitted with the latest machinery, will enable the company to supply this demand. The latest improvements on the Truax cars have just been patented during '98, and a catalogue will be sent to every one sufficiently interested to write for it from either the Denver or San Francisco factories.

THE Colorado Iron Works Co. have just finished at their works and shipped to the Smelting Corporation, Ltd., Cheshire Port, England, a complete 42x140-inch modern zinc-lead water jacket smelting furnace, with two spiral forehearths. They are also now making for the Nederlandische Indische Mijnbouro Maatschappij of Batavia, Island of Java, one of their latest improved copper matting furnaces, 42x120-inch, with Nesmith patent hot-blast stove, including blowers, slag cars, forehearths, all to be erected in the Celebes islands. For George Mitchell of Jerome, Arizona, they are making a 42x120-inch copper smelting furnace of latest designs, including blowers, slag cars, etc., which is to be erected in Old Mexico. The fact that this inland manufacturing concern, subject to all the disadvantages of high freights, etc., are booking orders from abroad, is evidence of the excellent standard of work they turn out.

THE Edward P. Allis Co. of Milwaukee, Wis., report the following sales of "New Leyner" drills during the past week: Three drills and compressor to Wm. Owsley & Co. of Butte, Mont.; three drills and compressor to Gaddis M. Co. of Oronogo, Mo.; two drills to Fayal Iron Co. of Eveleth, Minn.; two drills to Homestake M. Co. of Lead, South Dakota; one drill to Golden Reward M. Co. of Deadwood, South Dakota; one drill to the United Verde Copper Co. of Jerome, Arizona. The Allis Co. also report sale of two water-jacketed blast furnaces to Guggenheim Sons for the Monterey, Mexico, plant. These furnaces are of 175 tons daily capacity and are duplicates of an order for five which was filled by the Allis Co. early last year. This company have also received a contract for a 20-stamp cyanide plant for the Thayer M. & M. Co. of Miramar, Costa Rica, Central America. Several carloads of material for the three "Wethey multiple deck roasting furnaces," which this company is building for the Highland Boy smelter of Salt Lake City, have gone forward. Each of these furnaces has four hearths 10x83 feet.

DURING the year '98 the Link-Belt Machinery Co. of Chicago were very busy, necessitating running of their plant night and day for seven months and full time the balance. Representative contracts executed, were for the complete power transmission machinery, link-belt elevators and conveyors installed in the new plant of the Producers' Cotton Oil Co., Yazoo City, Miss.; Hoosiac "B" Elevator, Boston, complete grain elevator machinery; Chicago Virden Coal Co., Virden, Ills., one K. W. dynamo, engine, switchboard, and eight "Link-Belt" chain breast mining machines; McCormick Harvesting Machine Co., Chicago, sand handling conveyors for their foundry; Tuscaloosa Wadding Co., Tuscaloosa, Ala., wadding elevator; Colorado Fuel & Iron Co., Sopris, Colo., large coal conveyor, used in connection with their coal washer; Stineman Coal & Coke Co., South Fork, Pa., engine, 100 K. W. dynamo, switchboard, and 10-ton H. P. locomotive; Mandell Bros., Chicago, merchandise elevator extending eight floors; National Malleable Castings Co., Chicago, sand handling conveyors; Clearfield Coal Co, Tyler, Pa., one 150 K. W. dynamo, two 60 H.P. locomotives, switchboard, and three low "Link-Belt" mining machines; Albert Schwill Malting Co., Chicago, conveyors for handling coal into storage room and from same to boilers; Chicago City Railway Co, Chicago, coal elevator; Summit Coal Co., Linton, Ind., boiler, engine, 100 K. W. multipolar dynamo, switchboard, and one "Link-Belt" mining machine; Coxe Bros. & Co., electric coal scrapers; Consolidated Coal Co., St. Louis, one 100 K. W. dynamo, switchboard and 10-ton 26 gauge locomotive; Northwestern Gas & Coke Co., Evanston, Ills., coke elevator; International Packing Co., Chicago, complete system of hog conveyors; University of Illinois, Champaign, Ills., coal and ashes handling machinery; Patton Coal Co., Parron, Pa., one 100 K. W. dynamo, engine, and ten "Link-Belt" mining machines; Julius Knack, Detroit, Mich., retail coat pocket and conveyors; Morrisdale Coal Co., Morrisdale mines, Pa., engine, 100 K. W. dynamo, 10-ton 80 H. P. locomotive; American Glucose Sugar Refining Co., Waukegan, Ills., char. filters; Chase Elevator Co. Chicago, machinery for Chicago & Grand Trunk Ry. grain elevator, Elsdon station; Wisconsin Grass Twine Co., St. Paul, conveyors for handling hay; Deering Harvester Co., Chicago, sand elevator; Frankfort Chair Co., Joliet, Ills., rope drive; Paterson & Busby, Memphis, Tenn., log haul.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 27, 1898.

616,819.—PUMP—E. S. Barzee, Minto, Or.
616,567.—APPARATUS FOR SUBMARINE MINING—C. Brown, S. F.

616,646.—ROTARY PUMP—P. K. Wood, Los Angeles, Cal.
616,757.—NOZZLE—J. Wright, Roslyn, Wash.
29,868.—DESIGN—S. G. Marshutz, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PRESSURE REGULATOR FOR BEER.—C. Christian, Orland, Cal. No. 616,604. Dated Dec. 27, 1898. This invention relates to a device for regulating and controlling the pressure of gas in beer and other effervescent liquids. It consists essentially of a body piece having a plurality of independent passages opening through the rear end and each connecting at its forward end with a transverse passage. These passages are provided with controlling cocks and connections are made between the inner ends and corresponding casks so that pressure from any one of the casks may be transferred to the other in case the beer has become flat and it is necessary to revivify it.

BOTTLE.—M. F. Hudson, Oakland, Cal. No. 616,710. Dated Dec. 27, 1898. This invention relates to an improvement in bottles, and it consists essentially of a device introduced into the neck and adapted to render the bottle non-refillable after once been used. It consists of a cylinder integral with the neck having upper and lower ridges and introduced intermediate portion forming an annular chamber, said cylinder having a centrally disposed opening in the top with holes leading transversely therefrom into the annular chamber and an opening into the bottom forming an internal chamber having oppositely disposed conical ends, an elastic washer or cone fixed into the lower conical end of the chamber and a disk or plate within the chamber is adapted to normally rest upon the washer to close the inlet to the chamber. A second series of holes lead from the chamber to the surrounding annular chamber and a ball in the internal chamber normally rests on the disk or plate to retain it on its seat, the inclined walls of the upper conical end of the internal chamber serving to hold the ball against the disk when the bottle is partly inverted or laid on its side.

EVAPORATOR.—H. B. Schulte, San Jose, Cal. No. 616,638. Dated Dec. 27, 1898. This invention relates to an apparatus which is especially designed for desiccating various fruits and food products. It consists of an arrangement of trays upon which the product to be dried is distributed and an enclosing exterior casing and means by which the latter is heated, and a device by which the trays are carried horizontally around in the casing with a means for rotating the trays periodically upon vertical axes to change their position with relation to the source of heat. The heating apparatus is disposed in the lower part of a vertical cylindrical casing and an upwardly and outwardly diverging deflector acts to throw the heat outwardly and toward the upper part. A vertically journaled central shaft has radial arms and supports at the ends, tray carriers with yokes having central vertical journals carried by the support and about which they are turnable. A stop or vertically journaled roller is fixed within the casing so that the angles of the trays contact with it during their revolution and they are thus turned upon their own axes at each revolution about the common center.

Mill Practice of the Utica Mills, Calaveras Co., Cal.*

By W. J. LORING, Angels Camp, Cal.

It is proposed to describe in this paper as accurately as possible the present practice at the Utica mills, of which I am superintendent. The Utica Co. operates three mills, the Madison (40 stamps), the Utica (60 stamps), and the Stickle (60 stamps). My description will be based on the last named, in which I have experimented more than in either of the other two; but the practice is the same, under the same management, in all three.

Everything is run by water power, under about 420 feet fall at the Utica mill, and 425 feet at the Stickle mill, giving a pressure of about 185 pounds to the square inch. The Madison mill is situated about three-quarters of a mile below the Utica and Stickle mills, and has only some 100 feet fall from one place and 38 feet fall from the other. The water that runs the Utica and Stickle mills, and all machinery connected with the corresponding mines, is conveyed through ditch and pipe to the Madison mine and mill, where it develops power for the air compressor and the 40-stamp mill. The mill is run by a double turbine, made by the James Leffel Co., Springfield, Ohio. Of course, by using the water repeatedly, as we do, we get our power very cheaply.

As the result of many experiments, I have arrived at a very satisfactory practice in crushing rock at low cost per ton. This object, taken by itself, would simply require us to crush as much rock as possible for each unit of power, plant and time; but we must also keep the loss of gold per ton as low as possible. We have succeeded, I think, in securing both results to a creditable degree.

The rock, as hoisted from the mines, consists of massive quartz, schistose and slaty diabase, with iron sulphurets. At the head of the shaft it is passed ver a grizzly made of 3-inch round iron bars, 10 feet long, placed 1¾ inches apart, and set at an incline of 40°. These bars are supported at each end by a casting made for the purpose, with recesses to receive them. Worn out and discarded stamp stems are used, and answer very well.

At the lower end of the grizzly is situated the 10x16 inch Blake crusher, which is connected with the grizzly by a sheet steel hopper, set at the same inclination as the grizzly bars, and thus feeding the crusher by gravity. One Blake crusher of this size handles all the rock for the 60-stamp mill, aside from that taken out by the grizzly. The amount will be given below. One man on each ten-hour shift furnishes all the labor required at the crusher.

The crusher and grizzly are both set over a bin holding 50 tons, from which the rock is conveyed to three bins in the mill—one for each 20 stamps. The capacity of each bin is about 200 tons. These discharge into Challenge ore feeders, of which one supplies each 5-stamp battery.

The stamps, when newly shod, weigh 835 pounds each, and drop from 7 to 8 inches 100 times per minute. The 10 stamps, in two adjacent batteries, numbered consecutively, drop in the following order: 1, 5, 9, 7, 3, 2, 6, 10, 8, 4.

*Trans. Am. Inst. Min. Engs., Buffalo meeting, October, 1898.

(To be Continued.)

U. S. Gold Product For 1898.

Director of the Mint Roberts has received from the officials and agents of the bureau preliminary estimates upon the production of gold in the several producing States and Territories of the United States for the calendar year 1898. These estimates, although subject to revision, are deemed to be approximately correct. Nearly all of the States show an increased production. Colorado maintains and increases its lead by a larger addition to its product than in any previous year. The product in California was considerably reduced by prevailing drought, which affected the output of the placers, but the increase from lode mining has slightly more than offset this reduction. Returns are given below as compared with the final estimates for the production of the same States and Territories in 1897:

State.	1898.	Director Mint Estimate for 1897.
Alaska	$2,039,930	$1,778,000
Arizona	3,185,490	2,096,900
California	14,883,721	14,618,300
Colorado	24,500,000	19,104,200
Idaho	2,373,902	1,701,700
Michigan	65,000	62,000
Montana	5,209,302	4,373,400
Nevada	2,959,731	2,976,400
New Mexico	360,000	356,500
Oregon	1,343,669	1,353,100
South Dakota	5,841,406	5,694,900
Texas	7,500	7,400
Utah	2,174,513	1,726,100
Washington	509,483	419,900
Wyoming	5,168	11,200
South Appalachian States	33,382	283,300
Totals	$65,782,677	$57,363,000

A Misstatement Corrected.

TO THE EDITOR:—I note in your issue of Dec. 24th the following from your San Diego correspondent: "A recent strike in the Ranchito is turning out some specimen ore which mills well. This mine has recently gone into the hands of a receiver, a Mr. Lane having been put in charge to represent the Julian Mercantile Co., which had Supt. Couts ousted and Mr. Lane substituted."

On behalf of Mr. Cave J. Couts, the owner of the Ranchito mine, I beg to inform you that the alleged information contained in the foregoing paragraph is entirely without foundation. Mr. Couts was not the superintendent of the mine, but was owner of the same and is still such owner. The mine has not gone into the hands of a receiver, and there is no expectation that the same will go into the hands of a receiver. Mr. Lane was temporarily appointed foreman of the mine, but was subsequently relieved of duty.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co" and where there is room for it, with our trade mark Our German drawing instruments bear only the trade marks or

We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Paragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

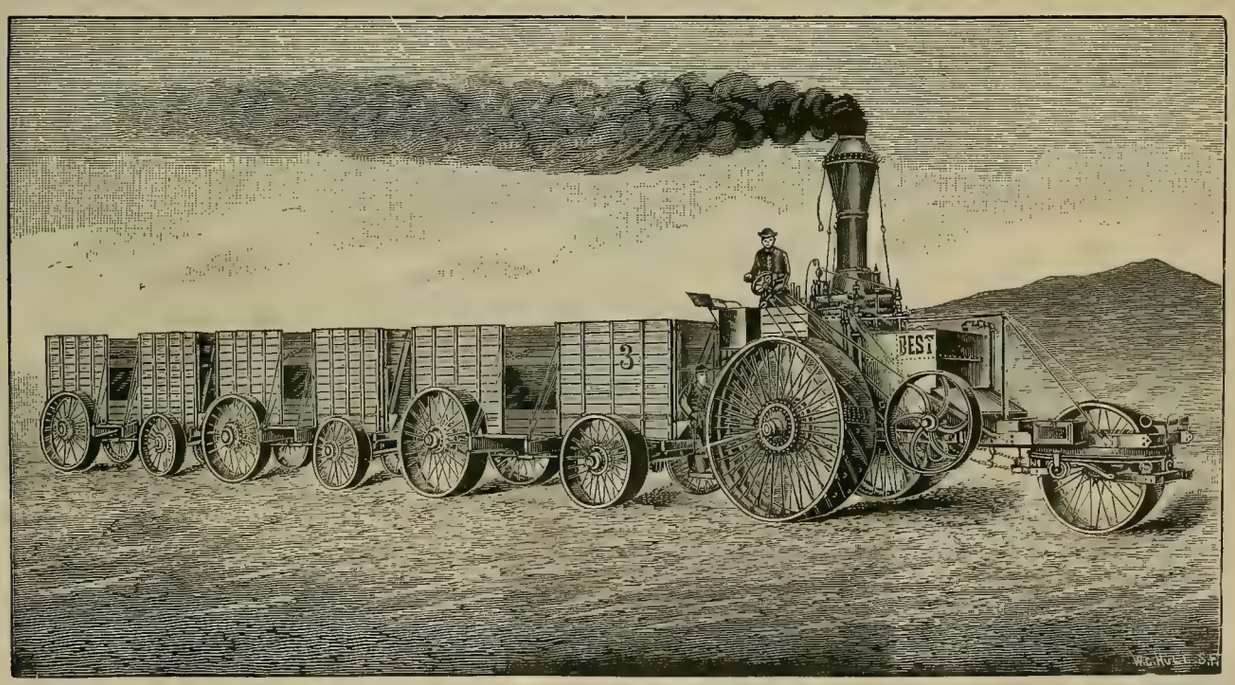
A REVOLUTION IN FREIGHTING.



THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO., SAN LEANDRO, CAL., U. S. A.

The Largest Locomotives in the World.

On this page appears an illustration of a 23″ x 32″ locomotive, recently delivered to the Union Railroad Co. of Pittsburg, Pa., showing the engine, with a small locomotive in the foreground. The line over which the engine operates extends from Munhall to North Bessemer, Pa., twelve miles. It is a part of the Carnegie system, connecting the Duquesne furnaces, Homestead Steel Works, and Edgar Thomson Steel Works. About four miles of the line has a grade of 70 feet to the mile, and about 2000 feet a grade of 2 4-10 per cent, or 126.72 feet to the mile.

The cylinders are of the half saddle type, made heavy, and have great depth, longitudinally. A steel plate 1⅜ inches thick, and of same width as bottom of saddle, extends across and is bolted to lower frames, and to this plate, as well as to the frames, the cylinders are securely fastened. Heavy bolts passing through top frame bars, front and back of saddle, form additional transverse ties, and relieve the saddle casting from all tensile strains. Longitudinal strains usually transmitted to cylinders through frames are largely absorbed by the use of a casting extending from bumper beam well up to saddle, securely bolted to top and bottom front frames. This casting also acts as a guide for the ...lster pin of truck. The frames are 4½ inches wide, ... from rolled steel slabs, and weigh 17,160 pounds ... pair finished.

This locomotive is in daily use, steaming well, not extravagant in the use of fuel and water, and appears to have ample grate surface for the work required. A detailed description is as follows:

GENERAL DESCRIPTION.

Type	Consolidation
Road number	95
Name of builder	Pittsburgh Locomotive Works
Name of operating road	Union Railroad
Gauge	4 feet 8½ inches
Kind of fuel used	Bituminous coal
Weight on drivers	208,000 pounds
Weight on truck wheels	22,000 pounds
Weight, total	230,000 pounds
Weight of tender, loaded	104,000 pounds
Weight, total, of engine and tender	334,000 pounds
Tractive power	53,292 pounds

DIMENSIONS.

Wheel base, total, of engine	24 feet
Wheel base, driving	15 feet 7 inches
Wheel base, total (engine and tender)	54 feet 9¼ inches
Length over all, engine	39 feet 8¾ inches
Length over all, total, engine and tender	65 feet 3¼ inches
Height, center of boiler above rails	9 feet 3¾ inches
Height of stack above rails	15 feet 6 inches
Heating surface, fire box	205.5 square feet
Heating surface, tubes	3116.5 square feet
Heating surface, total	3322 square feet
Grate area	33.5 square feet

WHEELS AND JOURNALS.

Drivers, number	Eight
Drivers, diameter	54 inches
Drivers, material of centers	Steeled cast iron
Drivers, material of main centers	Cast steel
Truck wheels, diameter	30 inches
Journals, driving axle, size	9 x 12 inches
Journals, truck axle, size	6 x 10 inches
Main crank pin, size	7 x 7 inches
Axles and crank pins	Carnegie steel

CYLINDERS.

Cylinders, diameter	23 inches
Piston, stroke	32 inches
Piston rod, diameter	4¼ inches
Piston and valve stem packing	Metallic
Main rod, length center to center	9 feet, 10½ inches
Steam ports, length	20 inches
Steam ports, width	1⅝ inches
Exhaust ports, length	20 inches
Exhaust ports, width	3½ inches
Bridge, width	1¼ inches

Cylinders and valves oiled by sight feed lubricator.

VALVES.

Valves	Balanced
Valves, greatest travel	6 inches
Valves, outside lap	1 inch
Valves, inside lap or clearance	0
Valves, lead in full gear	1-16 inch

BOILER.

Boiler, type of	Straight, with sloping back end
Boiler, water test	300 pounds
Boiler, steam test	220 pounds
Boiler, working pressure	200 pounds
Boiler, material in barrel	Carnegie steel
Boiler, thickness of material in barrel	⅜ inch
Boiler, diameter of barrel at front sheet	80 inches
Boiler, diameter of barrel at throat sheet	83¼ inches
Boiler, diameter of barrel at back head	74⅝ inches
Seams, horizontal, butt joint, double welted and	Sextuple riveted
Seams, circumferential	Double riveted
Thickness of tube sheet	⅝ inch
Dome, diameter	32 inches
Safety valves, two 3-inch open pops and one 3-inch muffler	32 inches

Water supplied through two No. 11 injectors.

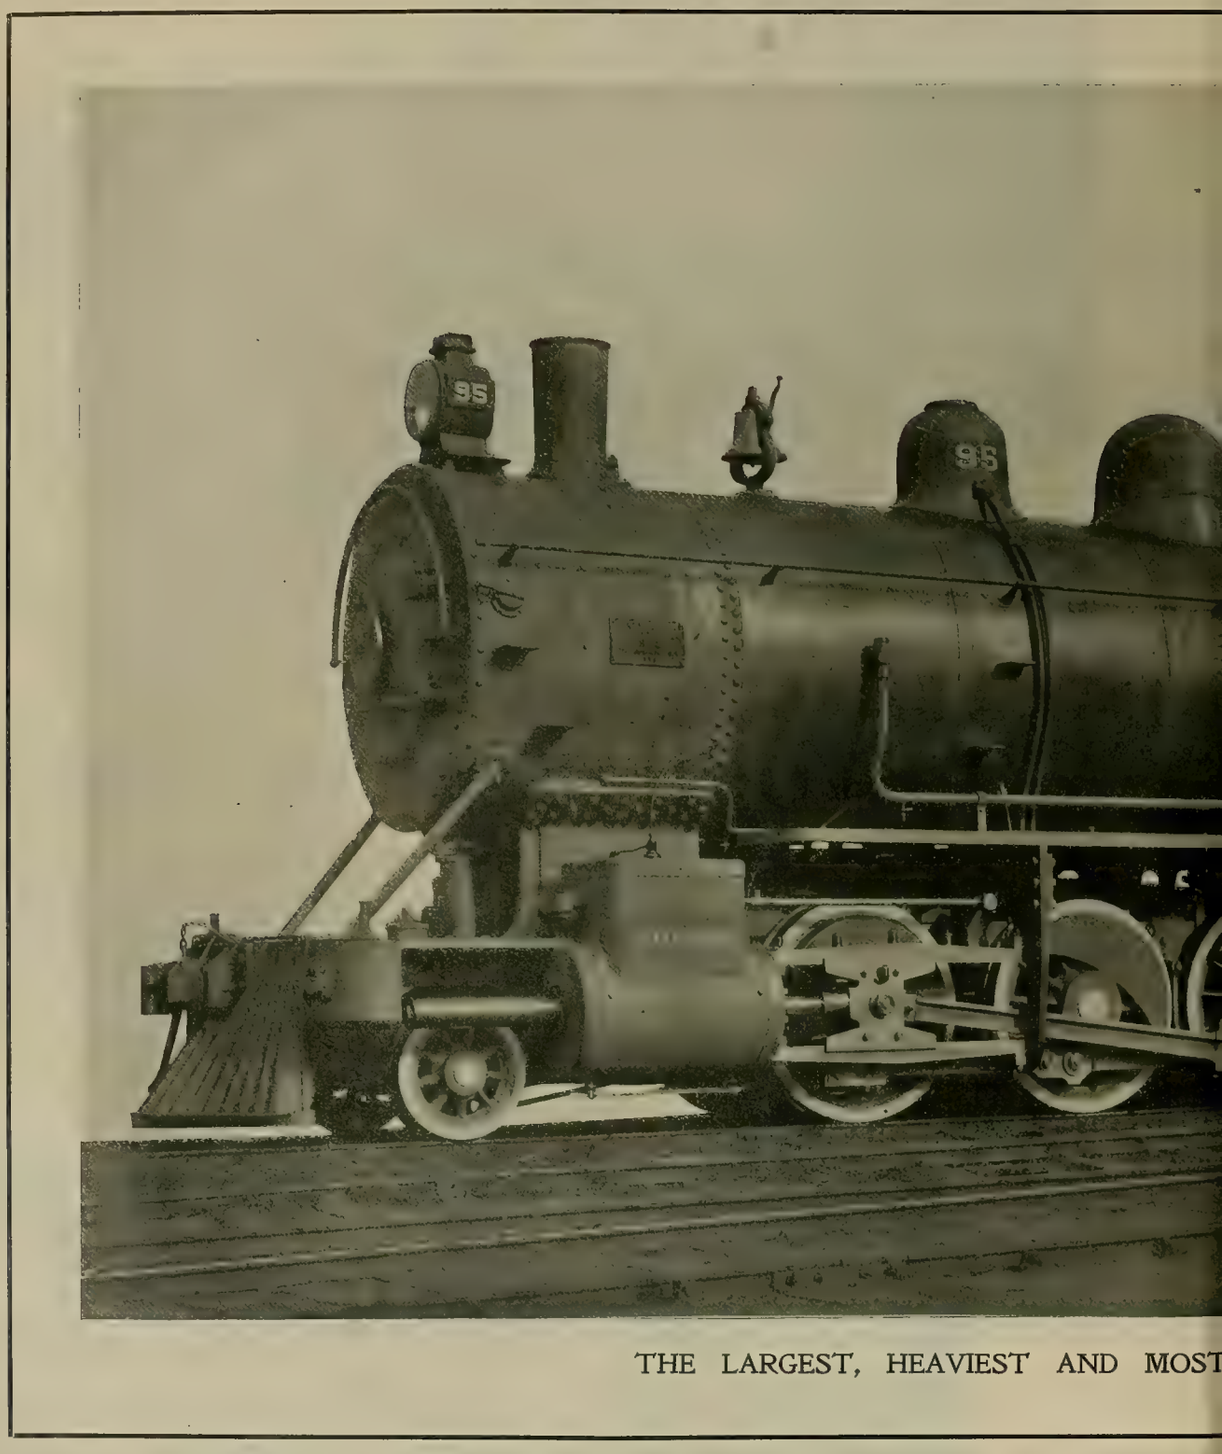
Crown sheet supported by stays	1⅛ inches diameter

TUBES.

Tubes, number	355
Tubes, material	Knobbled charcoal iron
Tubes, diameter, outside	2¼ inches
Tubes, length over sheets	15 feet

FIRE BOX.

Fire box, length	10 feet
Fire box, width	3 feet 4¼ inches
Fire box, depth, front	76⅜ inches
Fire box, depth, back	69 7-16 inches
Fire box, material	Carnegie fire box steel
Fire box, thickness of sheets, crown	7-16 inch
Fire box, thickness of sheets, sides and backs	⅜ inch
Fire box, thickness of sheets, tube	½ inch



THE LARGEST, HEAVIEST AND MOST

Fire box, water space, width, front, 4 in.; sides, 4 in.; back, 4 in.	
Fire box, brick arch	Supported on studs
Grates, cast iron, rocking pattern.	
SMOKE BOX.	
Smoke box, diameter	83¼ inches
Smoke box, length from tube sheet to end	68⅝ inches
OTHER PARTS.	
Exhaust nozzle	Single
Exhaust nozzle, diameter	5½ inches
Exhaust nozzle, distance of tip below center of boiler	5½ inches
Netting, size of mesh	2 x 2 inches
Stack	Taper
Stack, least diameter	17 inches
Stack, greatest diameter	18 inches
Stack, height above smoke box	2 feet 9 inches
Track sander	Pneumatic
Power brakes	Westinghouse American
TENDER.	
Type	With swivel trucks
Tank capacity, water	5000 gallons
Tank capacity, coal	10 tons
Kind of material in tank	Carnegie steel
Thickness of tank sheets	1-4 and 5-16 inch
Type of under frame	Steel channels
Type of truck	Diamond
Truck with rigid bolster.	
Type of truck springs	Double elliptic
Diameter of truck wheels	33 inches
Diameter and length of axle journals	5 x 9 inches
Distance between centers of journals	76 inches
Diameter of wheel fit on axle	6⅜ inches
Diameter of center of axle	5⅜ inches
Length of tender frame over bumpers	22 feet 11¼ inches
Length of tank	20 feet 6 inches
Width of tank	9 feet 8 inches
Height of tank, not including collar	56 inches
Height of tank over collar	68 inches
Type of back drawhead	M. C. B. coupler

POWERFUL LOCOMOTIVE IN AMERICA.

In connection with the above it will be interesting to note the dimensions of the largest locomotive in Europe. It belongs to the Belgian State Railroad. Both the big engines—the one illustrated herewith, and the Belgian—are designed for freight service on heavy grades; as their weight is about the same, a comparison is notable.

The heaviest grade on which the American engine must work is 2.4 per cent; that for the Belgian engine is 3.1 per cent. The American is of the consolidation type; the Belgian has six driving axles. The first three are on a truck, with the cylinders connected by means of flexible joints; the rear three axles are rigid in the frames, so that while the services required are similar, the Belgian engineers have adopted an entirely different and what seems to be a more expensive method of attaining their results. The engine is really a four-cylinder compound, the two high-pressure cylinders being applied to the rear set of drivers and the low-pressure to the drivers set in the truck. This has the advantage of using solid steam-pipe connections for the high-pressure and the flexible joints for the reduced pressure, bringing the exhaust under the stack, as desired. Herewith is tabulated the principal dimensions and weights of these locomotives:

Data.	**American.*	†*Belgian.*
Gauge	4 ft 8½ in.	4 ft. 8½ in.
Weight on drivers	208,000 lbs.	218,255 lbs.
Weight truck	22,000 lbs.	
Weight, total	230,000 lbs.	218,255 lbs.
Tractive power	53,292 lbs.	29,700 lbs.
Wheel base, total	24 ft. 0 in.	30 ft. 17½ in.
Wheel base, rigid	15 ft. 7 in.	9 ft. 10 in.
Center boiler above rails	9 ft. 3⅜ in.	8 ft. 2¾ in.
Top of stack above rails	15 ft 6 in.	14 ft. 5 in.
Heating surface, firebox	205.5 sq. ft.	159.5 sq. ft.
Heating surface, tubes	3,116.5 sq. ft.	1,574.5 sq. ft.
Heating surface, total	3,322 sq. ft.	1,734 sq. ft.
Grate area	33.5 sq. ft.	86 sq. ft.
Drivers, number	8	12
Drivers, diameter	54 in.	51¼ in.
Cylinders, diameter	23 in.	19¾ in. and 32 in.
Cylinders, stroke	32 in.	25½ in.
Valves	Bal. slide.	Piston.
Boiler pressure	200 lbs.	220 lbs.
Boiler, diameter at front ring	80 in.	60½ in.
Tubes, number	355	164
Tubes, outside diameter	2¼ in.	2¾ in.
Tubes, length over sheets	15 ft. 0 in.	13 ft 6 in.
Tubes, kind	Plain, iron.	Serve, brass.
Firebox, length	10 ft 0 in.	9 ft. 8 in.
Firebox, width	3 ft. 4½ in.	8 ft. 9 in.
Smoke box, length	68⅝ in.	79 in.
Smoke box, diameter	83¼ in.	62 in.

*Data for the American locomotive from the *American Manufacturer and Iron World*, Pittsburg, Pa.

†Data for the Belgian locomotive from *Revue Generale des Chemins de Fer*, through *Railway Gazette*.

The great discrepancy in the tractive power is caused by the early cut-off used in the compound engine. Using the formulæ

$$\frac{p\,d^2\,s}{D} \text{ and } \frac{2\,p\,d^2\,s}{(r+1)\,D}$$

the simple and compound engines, respectively, where p=boiler pressure, d=cylinder diameter (low pressure in compound), s—stroke, D—diameter of drivers, and r—s=stroke, D=diameter of drivers, and r=cylinder ratio, gives a theoretical tractive power of 62,000 lbs. for the American and 56,000 lbs. for the Belgian locomotive. These values are 30 per cent and 26 per cent, respectively, of the adhesive weights, but as the steam is allowed to follow only about one-third stroke in the compound, the effective pressure is reduced. The values allow a mean effective pressure of 86% of boiler pressure in the American and about 53% in the Belgian allowing, of course, for the relative action in the compound cylinders.

NOTICE.

The Name of the
RIX COMPRESSED AIR MACHINERY CO.
HAS BEEN CHANGED TO

The Compressed Air Machinery Co.

WM. A. HEWITT. P. H. REARDON.

11 & 13 FIRST STREET, SAN FRANCISCO.

WE WILL CONTINUE TO MANUFACTURE AND SELL

HIGH GRADE AIR COMPRESSORS,
"GIANT" ROCK DRILLS, MINING HOISTS, ORE CARS,
STEAM ENGINES, BOILERS, Etc.

Established 1860. ✦ ENGINEERS AND MANUFACTURERS OF **Ore Milling and Smelting Equipments.**

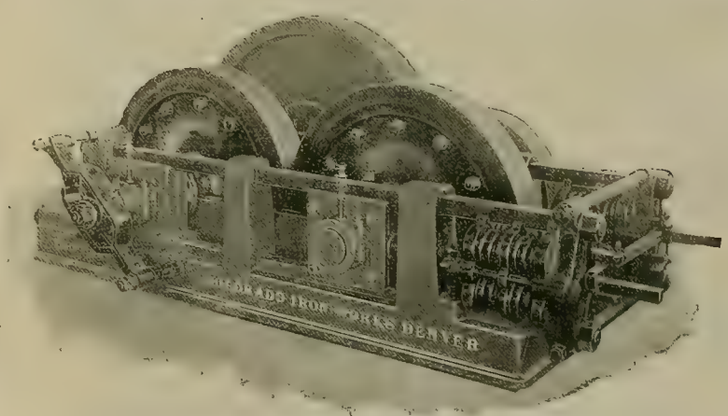
We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.



HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

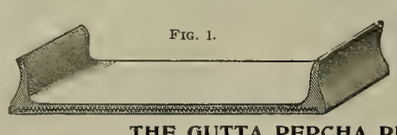


FIG. 1.

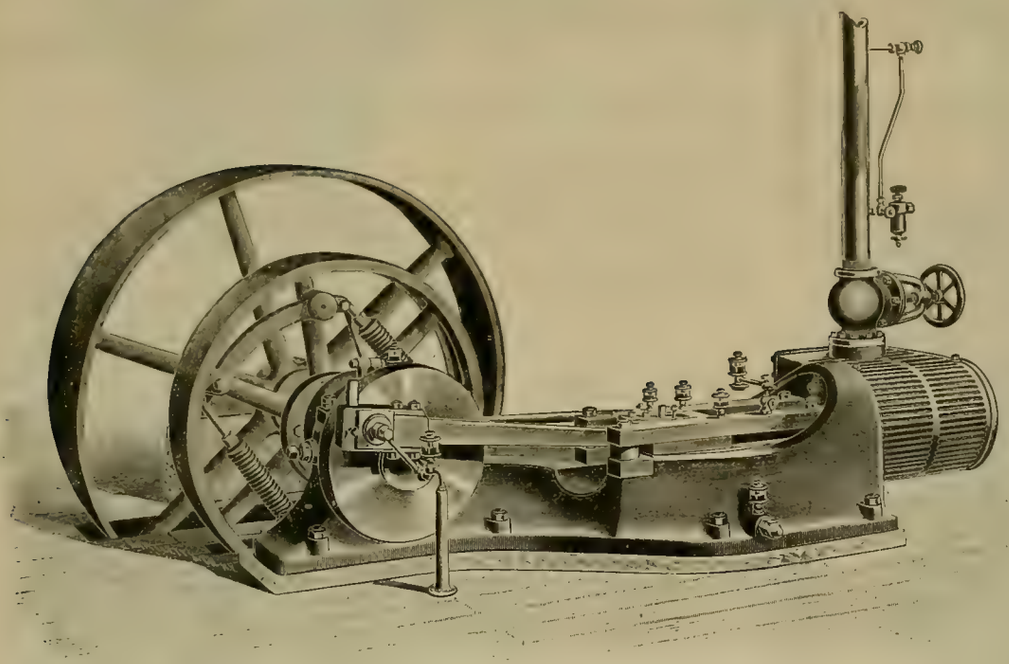
MACHINERY DEPARTMENT.



MEDIUM SPEED, SINGLE VALVE, AUTOMATIC ENGINE.

To meet the growing demand for a Medium Speed, Automatic Engine, we have brought out the Side Crank Engines, as shown in cut. These Engines are furnished with Balanced Valves and extra heavy wheels. The Governor is simple and efficient, insuring a fixed speed under varying load and steam pressures.

We can furnish them in sizes from 45 to 300 H. P. These Engines are particularly adapted in any establishment where it is important to maintain a constant speed, during frequent and sudden changes in load.

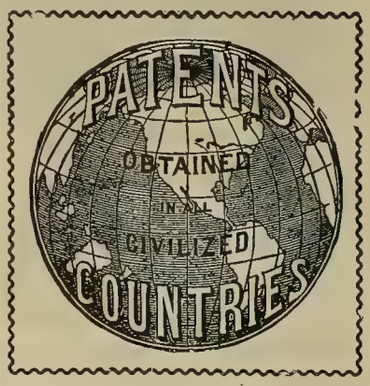
PATENTS



DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

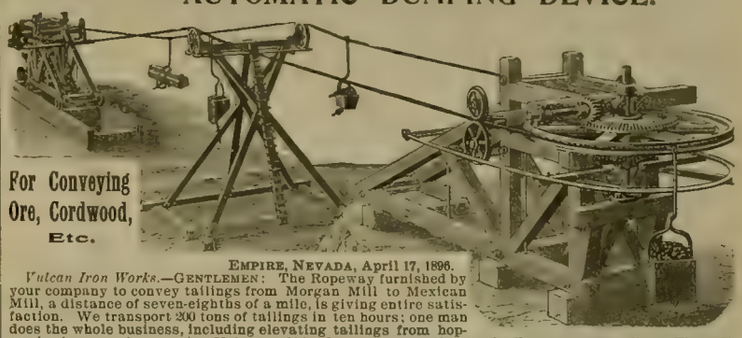
VULCAN ROPEWAY
—WITH—
AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 5, 1899.

SILVER.—London, 27⅛d; New York, 58⅞; San Francisco, 58⅞; Mexican Dollars, 47½@48. New York exchange, sight, 15; telegraphic, 17½ cents premium.

The Government standard of value for the Mexican dollar from January 1, 1899, has been established at .477, an increase of 4 mills over the previous rating.

Rain has caused rejoicing in California and the belief in a prosperous year, rain alone being needed. The general feeling throughout the country is that '99 will be a great year, greater even than '98. Investments are expected to be active. There is just cause for such belief.

There are more people now to invest and to operate, and more money to do it with. In 1880 we had a population of 50,000,000; in 1899 not less than 75,000,000. In the former year the amount of money in circulation was $973,382,000; it is now about $1,650,000,000. Our national debt was then $1,723,993,000, with an annual interest charge of $79,634,000, which was an average debt per capita of $38.27; in 1898 the debt had been reduced to $847,365,000, and only $13 per capita. It is impracticable to state accurately the present national wealth, but the census of 1890 showed an increase of real and personal property from $43,642,000,000 in 1880 to $65,037,091,000, and the gain since 1890 has been on a much larger ratio. Our railways have passed through the constructive and experimental stage, and their securities can now be bought upon a demonstrated value. The general tone of railway management has been improved, both in point of intelligence and integrity. Their stocks and bonds, therefore, offer greater attractions to capitalists or small investors. The marvelous mechanical and scientific inventions in twenty years have opened a new and profitable field for investment and speculation.

The concentration of control of great manufacturing lines has brought into the market attractive and profitable industrial shares. We are in close touch with foreign nations and international markets. Our people have increased in intelligence as well as in numbers and wealth. There is a greater general knowledge of the facts and influences which affect corporations and businesses. A new generation of men has come to the front since the great movement culminating in 1881. These men have had to face many trials and depressions. Until now they have had little chance to experience good times. They have been brought up in the wholesome school of adversity, and will be eager to take advantage of prosperity and to enlarge their business interests. The average business man has had all he could do for the last few years to keep himself going. This year he is accumulating a surplus and will want to make it earn something for him. The spirit of confidence is as contagious as that of depression. Leaders in the forward and upward movement will have ready and buoyant followers:

During the same time San Francisco received gold imports aggregating $30,305,487.

LEAD. — New York reports steady, $3.90 bid, $3.95 asked. The firm naming the settling price for leading miners and smelters at the West quotes Lead $3.70.

Assessment Notices.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of December, 1898, an assessment (No. 32) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1899, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 23d day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Mills building, room 31, 10th floor, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of December, 1898, an assessment (No. 22) of three (3c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of January, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of January, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CALVERT MEADE, Secretary.

Office—106 Leidesdorff street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of December, 1898, an assessment (No. 5) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of February, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1899, an assessment (No. 12) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, secretary.

Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 220 Sansome street.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the HORSESHOE BAR CONSOLIDATED MINING COMPANY will be held at the office of the company, Room 36, No. 330 Pine Street, San Francisco, California, on MONDAY, the 16th day of January, 1899, at the hour of 1 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. DELINQUENT SALE NOTICE.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 15th day of November, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
William Day	622	100	$10 00
George Straut	623	1,000	100 00
George Straut	646	500	50 00
E. P. Hill	637	150	15 00

And in accordance with law, and an order from the Board of Directors, made on the 15th day of November, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 213 Jackson street, San Francisco, California, on TUESDAY, the 17th day of January, 1899, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. J. MIDDLETON, Secretary.

Office—213 Jackson St., San Francisco, California.

Brunton's Patent Pocket Mine Transit.

Cut About One-Half Size.

The accompanying illustration shows this valuable instrument as it appears to the operator when taking courses or horizontal angles.

A tripod or Jacob's staff is unnecessary, as the sighting and reading are accomplished simultaneously.

Dimensions when folded for the pocket, 2¾x2¾x1 inches.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

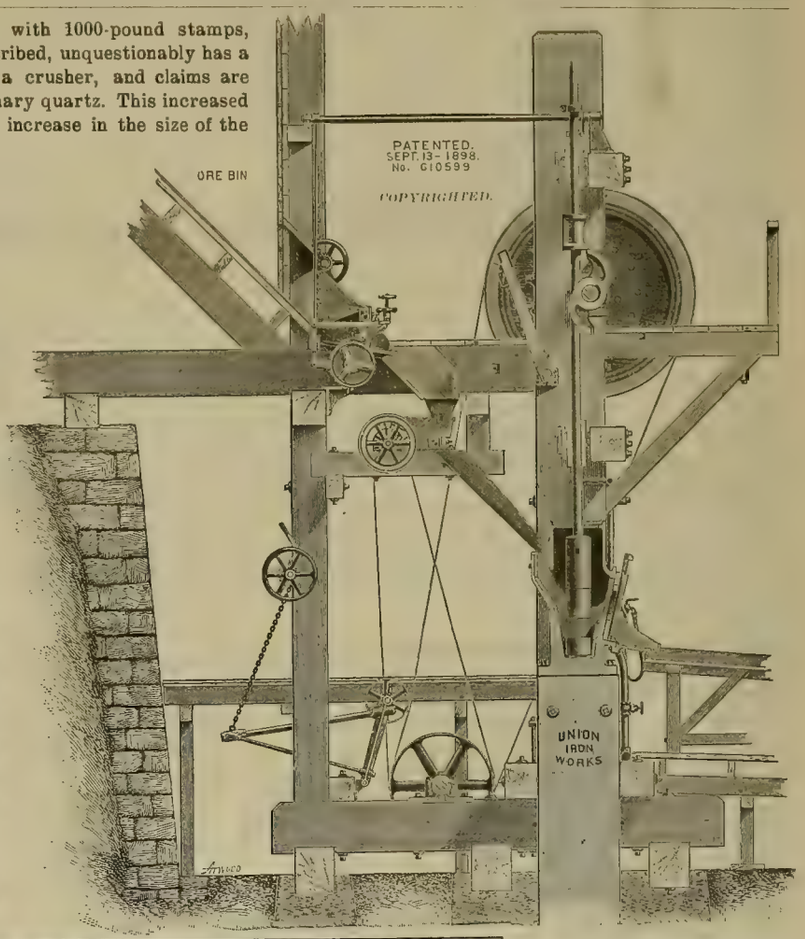
New Feature in Stamp Milling.

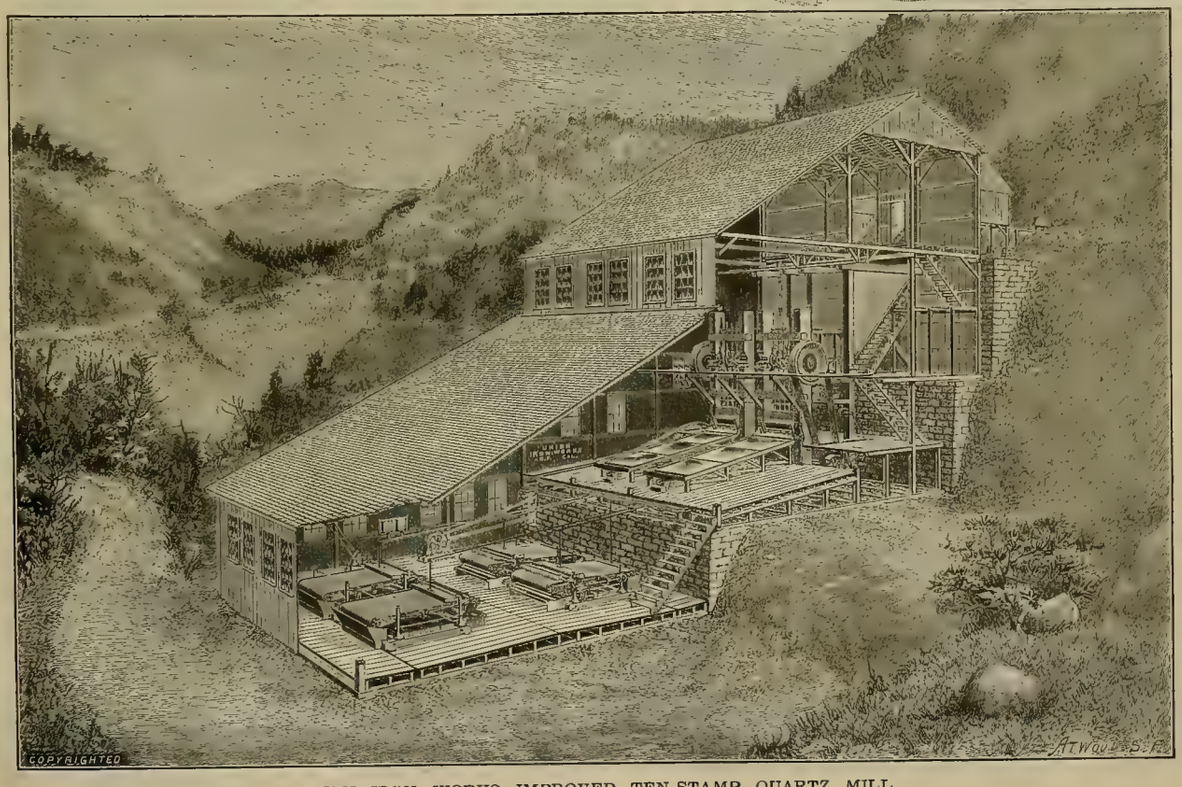
The Union Iron Works of San Francisco have recently introduced a new feature in stamp mill practice, illustrations of which are herewith produced. Instead of feeding the ore automatically into the mortar of a stamp battery in pieces ranging from two to two and one-half inches in size, requiring the stamps to perform a great deal of work that could be done by a breaker, thus reducing their capacity, the attempt has hitherto been made to crush the ore fine with a series of breakers before being put into the battery bins, but this method had to be abandoned, as it was found practically impossible to automatically feed the ore out of the bins, due to "bridging." This difficulty is intended to be overcome in the method here shown.

The ore is crushed to the usual size—from two to two and one-half inches—in the ordinary way, and dumped into the battery bins. From these it is automatically fed to the mortar by means of a combined ore bin gate and feeder, located above the feed floor of the battery, and operated by the central stamp as usual. The ore, on its way from the feeder to the mortar, passes through a small Dodge crusher, size 4″x6″, which crushes it to about one-quarter inch size before reaching the stamps. A five-stamp battery, with 1000-pound stamps, equipped with a fine crusher as described, unquestionably has a greater capacity than one without a crusher, and claims are made for five tons per stamp on ordinary quartz. This increased capacity of the battery calls for an increase in the size of the copper plates used, not in length but in width, as it is necessary to maintain a depth of pulp on the plates that will always insure fine gold coming in contact with the silvered surface. The plates used with these batteries are usually six feet in width by fifteen feet long, sometimes exceeding this in width, depending upon the character of the ore to be worked. In order to dress plates of this width, it has been found necessary to build these mills in units of five stamps, as shown in the illustration of a complete mill which is so minute as to detail that little description is necessary for our readers.

Reference to the sectional view indicates clearly the nature of the claim on which patent has been issued. In the ore stamp battery is a combination of primary crusher, a bin into which the ore falls therefrom, a secondary crusher, a feeder to deliver the ore thence to the stamp, drive mechanism for the crushers and stamp, and connected mechanism between stamp and feeder automatically regulating feed of ore from bin to secondary crusher. In the upper illustration will also be noted this secondary crusher between the ore feed and the battery mortar, the chute for conveyance to the latter, the bottom rotating table, the shaft-mounted pinion with eccentric-connected arm, the rod forming connection with an arm projecting from the rock-shaft, the stamp operated by the arm and the collar mounted thereon engaging with the arm with means for returning the shaft rocker to its initial position. No royalty or extra charge is imposed by the manufacturers of this new stamp mill.



SECTIONAL VIEW BATTERY WITH SECONDARY CRUSHER.



UNION IRON WORKS IMPROVED TEN-STAMP QUARTZ MILL.

While the duty of a stamp is affected largely by the dissimilarity of ores, varying in actual practice from one to three tons every twenty-four hours, yet any advance in increased crushing capacity is a direct gain in economics.

A ten-stamp battery, having a capacity of fifty tons per day, certainly works an advance in milling that will attract attention.

Riparian Rights.

Under the title of Merced G. M. Co. vs. Dorward et al., a suit is now pending in the U. S. Circuit Court at San Francisco, which, by reason of the principle involved, is of more than passing interest to every water user in California.

The facts are briefly as follows: Plaintiff company bought in '94 the rights of the Golden Rock Ditch Co. The ditch, built about '60, carried 4000 inches of water from the South Tuolumne river to the mines at Big Oak Flat. Later it was extended to Horse Shoe Bend on the Merced river in Mariposa county. No use has been made of the water for twenty years, though the diverting dam, which washed out in '90 was rebuilt in '92, and in '94 present owners employed two men some months cutting trees and brush. Meantime flumes had rotted down and trees had grown in the canal bed. Recently defendants made a water location a mile farther up the stream and began construction of a ditch to carry water to the vicinity of their mining properties near Jacksonville, Tuolumne Co. Plaintiff sues to quiet title and a temporary injunction restrains defendants from continuing work.

The important point in the case is that while plaintiffs virtually admit such continued non-use of water as to amount to statutory abandonment and to work a forfeiture under the terms of the California water law, they set up that under the terms of the mining act of Congress of '66, (the ditch being then in use), they acquired a title prior to and independent of the terms of the State laws and free from the obligations to make continuous use of the water, which the latter statute imposes. The text of the law under which this title is claimed (Sec. 9, Act of July 26th, '66, repeated in Section 2339, U. S. Revised Statutes), is as follows:

SEC. 9. That whenever by priority of possession, rights to the use of water for mining, agricultural, manufacturing or other purposes, have vested or accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes aforesaid is hereby acknowledged and confirmed.

The doctrine that Congress in '66 made, of the waters of every ditch then in use, a grant which was unconditional and could not in any way be forfeited or abandoned is a novel one. Equally unexpected is the ruling of the court that a subsequent locator may be enjoined, even temporarily, from the construction of another ditch from another point on the same stream at a time when plaintiff was making and could make no use of the water.

Should the court finally adopt plaintiff's theory, that the title to every ditch in use on July 26th, '66, is still paramount, it will cause great disturbance to all water users and may upset the entire structure of water law which our courts have built up upon the principle of continuous use of water for a beneficial purpose as a basis of right of use. There are hundreds of these old ditches throughout the State antedating '66 and long since abandoned, and below them have sprung up innumerable irrigation, water power and electrical enterprises, all of which would be at the mercy of anyone who could show color of title in one of those old canals, in case the court should decree plaintiff's theory to be the law.

The case under consideration is somewhat in point, as the plaintiffs assert the right to again discharge the Tuolumne waters into the Merced as was done in '66, notwithstanding that since they ceased to use the water the Modesto and Turlock irrigation districts have expended millions of dollars on their canal systems and the great La Grange dam, lower down on the Tuolumne, and they will lose the use of whatever water is carried to the Merced. It is stated that steps are being taken by the irrigation district authorities to be allowed to intervene in the suit in order to protect their own interests.

Not Alone "Copper" Mining.

Following is an excerpt from an excellent article on copper mining in the Boston *Financial News* of the 3rd inst.:

Copper, indeed, can scarcely be considered, as the copper industry is now conducted, a mining venture in the ordinary sense of the word. Copper mines are worked on the same scale and with the same attention to the conditions of the market as any other manufacturing industry, and they should be judged by investors on much the same basis. Where there is a large supply of ore, even of a low grade, with considerable assets in the shape of furnaces or other appliances of recent date, it is scarcely possible that, with good management, other than good results should accrue. There are new copper companies coming, and with the present plethora of money there is no doubt that any good, sound enterprise introduced under good auspices will meet with a favorable reception from investors, who are tired of leaving their deposits uselessly in the banks.

The argument that copper should be removed from the domain of "ventures" applies just as well to the mining of gold. Indeed, to substitute in the above the word "gold" for the word "copper" would not destroy its force or truth; rather could it be thus enhanced, for it could be further said of gold what is denied even to copper mining that in the case of gold production is removed every vestige of chance of competition, or "cornering," or need of seeking combines or customers.

REGARDING the Tropenas steel process referred to and illustrated in the issue of Dec. 31st, '98, in answer to inquiries it may be said that the converter is a form of vessel in which there are two sets of tuyeres. The lower series drives the blast just over the surface of the metal; the upper set of smaller size is supplied with air by a separate blast box, which, during the progress of the boil, admits air merely for the purpose of burning the carbon monoxide inside the vessel. This increases the temperature and the fluidity of the metal. There is also an outlet provided near the upper part of the vessel for hot gases to pass through a hollow trunion into a regenerator, which heats the air coming from the blowing engines to the tuyeres. Oxidation takes place at the surface of the metal only, and it is claimed that there is no stirring movement and mixture of slag with metal during the blow so that the impurities in the slag do not get back into the metal. The temperature of the steel being very high, admits of its being removed from the converter in small quantities at a time for casting purposes. It is stated that the reaction is transmitted from molecule to molecule from the surface throughout the bath to the bottom, but unless there is movement of the metal this can take place only by diffusion of oxidized products dissolved in the bath, or by rapid diffusion of oxidizable impurities bringing them to the surface. The former action would operate much more quickly than the latter, and oxidations taking place beneath the surface would no doubt give rise to ebullition and thorough mixing of the metal, but not of metal with the slag. This method of blowing obviates the inconvenience and loss occasioned by the projection of metal and slag from the mouth of the vessel which is a feature of the ordinary process. It is claimed also that, owing to the bath being comparatively quiet, there is less waste from oxidation. However this may be, it is a fact that a slag very rich in iron is produced at one period of the blow. The process may be acid or basic and ferro-silicon or ferro-manganese finally added.

A "Division of Mines."

The movement favoring the creation of a department of mines and mining, a Cabinet position, which began some time ago, is not rapidly gaining the favor it should. The arguments adduced herein in support of the proposition are so far unanswered, because unanswerable, but inaction and inertia make the matter a hard one to push, there being further hindrance by premature announcements here and there of the hopes or claims of sundry individuals to attain the projected position. That should be the last thing to be considered.

Director Wolcott of the U. S. Geological Survey, has secured the introduction at this short session of Congress of a joint resolution providing for a division of mines in connection with his department. The resolution is worded as follows:

Joint resolution to provide for a division of mines and mining in the United States Geological Survey.

WHEREAS, The mining interests of the United States, which yielded during the calendar year eighteen hundred and ninety-seven an increase to the nation's wealth of five hundred ninety-four million nine hundred and ninety-one thousand dollars, have not clearly defined representation in the organization of the government; and

Whereas, It is desirable that there should be such a representation for the purpose of gathering and publishing statistics relating to mines and mining, including the statistics of gold and silver as mineral products from each State and district, in addition to the statistics now gathered by the director of the mint, and statistics in relation to labor employed and wages earned in mines and mining, and for the purpose of compiling and publishing the laws relating to prospecting, prospectors, and mining generally, and recommending revisions of the same; and

Whereas, Mining and mineral statistics of all kinds should be simplified and prompt publication made of them; therefore

Resolved, By the Senate and House of Representatives of the United States of America in Congress assembled, that a division of mines and mining be, and is hereby established in the United States Geological Survey, to be organized by the director of said survey, for the purpose of gathering and publishing statistics of the mineral resources of the United States, including the products of gold and silver, based upon the actual mined product of each State, and statistics of labor employed and wages earned in mining operations, and making investigations in relation to mines and mining generally, and publishing the results thereof, and for the purpose of compiling and publishing the laws relating to prospecting, prospectors and mining, and recommending revisions of the same; and that there be appropriated for the purpose of this division one hundred and fifty thousand dollars: Provided, That the statistics and information gathered by the division of mines and mining and by the division of geology of the Geological Survey may be published as a part of or a special appendix to the annual report of the director of the survey, or as special papers where early publication is desired, the size of the edition of each such special paper to be controlled by its economic importance and to be determined by the director of the Geological Survey and approved by the Secretary of the Interior; Provided further, That the entire cost of composition, paper, printing, illustrations, and binding of such special papers shall not exceed ten thousand dollars, the cost of which shall be charged against the appropriation for the division of mines and mining. Provided further, That all statistics for each calendar year shall be published and delivered to Congress by the first day of December of the succeeding calendar year; Provided further, That the separate chapters on any given mineral product, such as gold, silver, iron, coal, building stone, and so forth, shall be printed as transmitted for publication; that a pamphlet edition of any chapter shall be printed for distribution on request of the director of the survey, approved by the Secretary of the Interior, the size of the edition to be controlled by the economic importance of the mineral treated and to be determined by the director of the survey and approved by the Secretary of the Interior; Provided further, That the entire cost of paper, printing, and binding of all such separate chapters shall not exceed five thousand dollars, and that this cost shall be charged against the appropriation which bears the cost of the printing and engraving for the annual report of the director of the survey.

Concentrates.

THE California quicksilver industry gives employment to about 4000 men.

WATER is fifty cents per barrel in the new mining camp of Republic, Wash.

THE Hastings mineral district of Ontario, Canada, has established a public assay office.

AN "aluminum deposit" 4 feet thick, and, as usual, "inexhaustible," has been found on Orcas island, Puget sound.

THE determination of the specific gravity of any solid or liquid must be made at a temperature of 60° F., or 15.5° C.

A BAROMETRIC reading of 22.5 inches indicates an altitude of 7980 feet, and an atmospheric pressure of 11.04 pounds per square inch.

THE specimen of "white metal" from Prescott, Arizona, is chalcocite, or copper glance, containing about 60% copper, 5% iron and 18% sulphur.

DRY WASHERS in absolutely dry ground work all right on a small scale, but to attempt such work on a big plan is not successful so far as known.

THE longest telephone line in the world is now in operation between Livingston, Montana, and San Diego, Cal.—2161 miles; five minutes, $18.

WITH a boiler 30 feet long, 36 inches diameter, holes punched, joints single-riveted, working at 80-lb. pressure, the sheets should be .2618 inch thick.

IN a chimney 80 feet high, of the area stated, the draught-power is equal to .585 inch of water, about the same as a wind with a velocity of 42 feet per second.

WHAT is practically pure sulphur is manufactured by the Western Chemial Works, Denver, Colo., at $22 per ton, from ore from the Vulcan mine, Gunnison Co.

A CHARGE of abandonment will not be entertained against any one while serving in the United States army and who is thus debarred from prosecuting his case.

THE American Mining Co. (J. B. Haggin's company), at El Oro, Mexico, has a new 100-stamp mill, the most extensive plant in the Republic, daily handling 200 tons of ore.

OFFICIAL tables of "Fifty Years of California Rainfall" have been compiled by this paper, printed in convenient form, and will be sent postpaid upon request to any address.

THE Independence mine, Cripple Creek, Colorado, began producing in '93. To Nov. 30th, '98, it had yielded $4,000,000, of which $2,300,000 is the profit of its owner, W. S. Stratton.

WHERE a written contract for the sale of machinery specifically describes the kind, the size and the amount, with express warranties as to capacity, no other warranties will be implied.

CONGRESSMAN SHAFFROTH of Colorado has introduced a bill to amend the war revenue law so that when power of attorney to sell mining stock is endorsed on the back no stamp will be required.

THE plenteous rains throughout California will enable a resumption of many mine dividends, which were seriously menaced by the long continued drought that is now, happily, a thing of the past.

PORT ORFORD BEACH sand miners say copper and cloth is best for practical work and beats any other device. An illustrated detailed description of the Banta machine was published in the issue of April 18th, '96.

THE average amount of moisture in good dynamite is figured at one-half of 1 per cent. If on entering a dynamite supply store a strong odor of nitric acid is noticed, the explosive should be destroyed without delay.

ZINC is advancing in price. In '97 the miners in the southeastern Kansas and Joplin, Mo., districts got an average rate of $20 per ton. In '98 the average exceeded $30 per ton. The '98 zinc output of the latter district was 441,156,945 pounds.

"VELNA" is a newly invented fuel, made so far exclusively in Nice, from petroleum residue, refuse from animal grease, and soda lye; it is possible the vast heaps of coal waste and "culm" in various parts of this country may thus be utilized.

A CUBIC FOOT of lead ore weighs 674 pounds. Thus a vein of galena 1 foot wide, 6 feet high and 6 feet long will produce 16,582 pounds; or a vein 1½ inches wide will net one ton to the fathom, 3 inches wide two tons, 6 inches wide four tons, etc.

DURING '98 at the Denver, Colo., branch mint was received in gold $20,345,995.64. During that year Colorado gold to the value of $11,869.23 was deposited in the New York assay office, $146.75 in the San Francisco mint, and $5274.80 in the Philadelphia mint.

SUPT. SHARON says on account of unavoidable delays the Comstock Pumping Association has extended the time to Feb. 1st, '99, for the Risdon Iron Works Co. to complete the installation of the pumping plant, and expects that it will be in operation by that date.

PLACER mining in Montana bids fair in '99 to assume its old time proportions. In Madison county especially, in Alder gulch and Ruby valley, placer projects are in embryo involving the expenditure of several hundred thousand dollars, with promise of satisfactory returns.

A DAWSON CITY, Klondike, letter says the miners distrust the banks there and will ship their gold to San Francisco. Local brokers are paying $15 an ounce for gold dust, which is better than the miners can do at the banks. Considerable gold is being taken out this winter.

THE schooner Pearl of the Alaska Commercial Co., at San Francisco with $47,000 in bullion and seventy-six tons of concentrates from Unalaska and Unga, is the last vessel of the season to leave that part of Alaska, and there will be no more news from that quarter for some months.

UNDER certain conditions steamboating on the upper Yukon is a pretty good gold mine of itself. During the four months ending Oct. 26th, '98, the Willie Irving, a little sternwheeler, made ten trips between the upper lakes and Dawson, the receipts being $127,668, one trip realing $23,300.

IF an inventor forgets or abandons his invention after a reduction to practice in private, and before a public use, his competitor may claim the patent. If he forgets or abandons it after a public use his competitor can take no patent, but the forfeiture will inure to the benefit of the public.

COPPER has made Butte, Montana, the greatest mining camp on the continent. In '98 its mines yielded 300,000,000 pounds copper and paid about $10,000,000 in dividends. A local publication figures that there are on the payrolls of the Butte mines 6548 men, who annually draw in wages $8,250,480. This is exclusive of about 2000 men employed in the concentrators, smelters, etc., who in the aggregate are paid annually $1,512,000 more. The amount thus paid out for wages in '98 about equaled the amount of dividends declared.

IN recent tests of leather belting, single belts of an average thickness of .20 of an inch and double belts of an average thickness of .35 of an inch were used. The average ultimate strength per inch of width for single belts, as shown by these tests, is 918 pounds; for double belts the ratio is 10 to 7.

THERE is no definite nor regular percentage in amalgam from a hydraulic sluice or anywhere else. Ordinarily it may run about 35% gold and 65% quicksilver. Were 150 pounds of such amalgam retorted, it would probably yield in redistillation 88 pounds of quicksilver, indicating a loss of about 10%.

ORE containing nickel, cobalt and copper, giving from an assay of five grammes, 2.467 gms., arsenides from fusion, 1.246 gms., arsenide of cobalt, nickel and copper, .542 gram, arsenide nickel and copper and a button of copper and gold .421 gram, with .15 gram gold added, contains 5.42% copper, 2.04% nickel, and 8.6% cobalt.

AN Eastern estimate places the aggregate U. S. mineral production of '98 at $752,927,047. In this gold is credited with a total yield for that year of $64,200,000; silver, 64,060,000 ounces; copper, 546,367,793 pounds; pig iron, 11,712,000 tons; lead, 217,067 tons. The estimate figures the world's gold production of '98 at $286,218,954.

IN assaying for bismuth the sample may be native bismuth, bismuth residue or combination, or an alloy. If the first, the assay should be as that for sulphide of antimony; if the second, cyanide of potassium, carbonate of soda, potash and salt are required, the result of the fusion to be tested for other metals; if the third, by wet assay or analysis.

SENATOR PETTIGREW of South Dakota has a proposed amendment to the sundry civil appropriation bill, providing that the fees of United States deputy surveyors for surveying, platting and certifying to a mining claim where the claimant wishes to obtain patent, shall not exceed $30 for any one claim, or $7 per day for each day actually and necessarily employed in such work.

MR. TURNER, Canadian ex-premier, speaking on the proposed British Columbia legislation against aliens in the matter of taking up placer mining claims, says at Vancouver: "I am in favor of British subjects getting the cream of the gold districts of Canada. I hardly think the Americans will bring on any very strong retaliatory measure should the bill become a law."

IN '98 Denver, Colo., imported from British Columbia and Mexico 18,865,125 pounds silver-lead ore, worth $214,502. During '97 Denver's similar importations were 20,000,000 pounds, valued at $300,000. During the last half of '98 such importations there fell off because of the great increase of silver-lead ores received by the Denver smelters from Colorado, Idaho and Utah.

"THE latent heat of vaporization," is the amount of heat that becomes latent when a liquid changes its form to gas or vapor. It is, for instance, the number of units of heat absorbed by one pound of a liquid in the act of passing to the gaseous state. Thus a pound of water at 212° F., absorbs as much heat as would have raised the temperature of the water 966° had it not become latent.

"FORFEITURE" of rights to an unpatented mining claim rests solely upon the compliance or non-compliance with the State and Federal statutes. A "forfeiture" is not an abandonment, the latter being a voluntary act, while the forfeiture may be beyond one's control. Anyone anywhere in the United States may enter upon and locate public mineral land which has become forfeited or abandoned.

AIR, having weight, must, necessarily, have inertia. It requires force to put it in motion, and, when in motion, it must meet with some resistance to bring it back to rest. Its inertia is exactly proportionate to its weight, which, in proportion to its volume, is so small that a very small force is sufficient to put a very large volume of air in motion. As regards ventilation, air is like a rope—easier pulled than pushed.

A BOULDER COUNTY, Colo., miner has compiled a table showing the price at which mining supplies sold there in '70 and in '98. In '70 giant powder sold at $1 per pound, and now it is 13 cents. Steel in those days cost 40 cents, now it sells at 8 cents up there. Candles that now retail at $4 a box then cost $20. Smelting charges were $60 per ton, and he now gets it done for $7, and so on through a list of some fifteen or twenty articles.

ON a pipe line in a slope being 144 square inches in area, 2000 feet long, the slope dipping 1 foot in 10, there is a pressure at the bottom end of the pipe of 1175.272 pounds. With a tensile strength of 16,000 pounds per square inch, the theoretical resistance of the pipe would require a thickness of one-twenty-eighth of an inch. Practically, it should be several times that to resist handling, wear, corrosion and extra strain.

THERE is nothing in the mining law regarding the legality or illegality of location work on any day of the week. A minor can take and hold a claim. There is nothing in the Federal mining law which prevents any one locator from appropriating as many locations on the same lode as he may be able to find independent discoveries upon which to base them, but no location can legally exceed the statutory limit as to length and width, namely: 1500x600 feet.

FOUR men were recently killed at the Jumper mine, Stent, Tuolumne Co., Cal., being plunged in a skip to the bottom of a 775-foot shaft. The accident was caused by the carelessness and neglect of the engineer in charge of the hoist. The incident gives additional point to the argument that engineers so employed should be licensed. Some go still further and maintain that California should have a State mining inspector, with jurisdiction over mines, hoisting works and machinery.

AUSTRALIA is suffering from as bad a drought as that from which California has just emerged. The *Mining Standard* of Dec. 15 says: "That the drought is more severe than most of those which have recently visited Australia is evident from its effects. The lignum is reported to be dying out of the dry beds of the rivers. Fences and gates in many places have been buried in drifting sand, carried by dust storms. Stock are perishing. Old residents declare that nothing like it has been known for thirty years."

A SUIT involving an interesting question is at issue in Salt Lake City, Utah, between W. A. Clark of Butte, Montana, and A. G. Campbell of the former place, involving $19,000. It is stated that on Oct. 1st, '98, L. C. Trent of Salt Lake agreed to buy for W. A. Clark 95,112 shares stock of Ophir Hill M. & C. Co. for $75,000, the stock to be deposited in escrow and payment to be made Nov. 24th. On Nov. 22d, '98, the company paid a $19,000 dividend, which, it is asserted, was taken possession of by Mr. Campbell, the seller of the stock, and suit is brought to recover that amount.

THE Director of the U. S. mint estimates the supply of money in the world on Jan. 1st, '99, as follows:

Gold	$4,504,900,000
Silver	3,977,500,000
Uncovered paper	2,322,800,000
Total	$10,895,200,000
On Jan. 1st, '94, he estimated it to be:	
Gold	$3,419,500,000
Silver	4,442,700,000
Uncovered paper	2,700,000,000
Total	$10,562,200,000

THE stated difficulty in starting the gas engine may be because of a dirty slide valve. In some gas engines the lubricating oil is led from a general lubricating apparatus to the slide valve and piston. On stopping the pipes are filled with a considerable quantity of oil, which generally leaks out, and the channels and grooves of the igniting apparatus in the slide valve are filled. If after standing some time it is attempted to start up the engine, many futile turns may have to be given in order that the oil may be blown out from the main channels and grooves of the slide valve. This may be remedied if, on stopping, a small piece of wood, which will absorb the escaping oil, be placed under the mouth of the tube feeding the slide valve.

DR. JOHN HALDANE, probably the best living authority on gases in mines, recommends the use of mice as a test for carbonic oxide as being the best and practically the only method for testing underground. A mouse is overcome in about a twentieth part of the time that a man would be. So that if a mouse is confined in a wire cage and taken into the workings, and is overcome in one minute, the men may take it as a warning not to stop in those workings for more than ten minutes. Chemists, of course, can detect this gas easily in their laboratories, but it is manifestly impossible to take a lot of appliances into a mine, to say nothing of the time that is required to make the tests. The reason that the mouse is overcome sooner than a man is that the circuit of its blood from the lungs to the heart, and thence through the body is so very much shorter than that of the larger mammal.

THE Empire mine, Grass Valley, Cal., is a good example of the permanence of gold mining in one spot. It has been worked continuously since 1850, and has yielded over $6,000,000. Just now additional appliances—practically a new plant—are being put in, and indications are that it will continue to be a leading gold producer for fifty years more. It is such "going mines" as the Empire that controvert the mistaken notion that gold mining is transitory and ephemeral. How many business enterprises in California or anywhere else have been in existence fifty years, or, if so existing, have gone on making money for their proprietors continuously? The only mistake California makes is not advertising the existence of such profitable mines. Being in California, it is taken as a matter of course. Were it elsewhere, the fact would be heralded and made a matter of world-wide notoriety.

THE advance in price of copper shares during the past few years has been remarkable. Calumet & Hecla stock, which sold at $650 per share a few weeks ago, touched $247 in September, 1893. Tamarack, which sold at $180 during December, 1898, sold at $64 in September, 1896. Quincy sold at $80 in 1893, since which time the capital stock has been doubled, the new stock costing old shareholders but $25 per share, a total of $105 for two shares, now worth $282. Osceola sold at $20 per share in September, 1893, and touched $80 recently. Atlantic, now selling at $31.50, was sold at $7 five years ago. In 1893 Wolverine sold at 75 cents per share and is now earning 10 per cent per annum on $33. Allouez sold at 50 cents per share in 1897 and 10 cents per share in 1896, but is now worth $6.50. Centennial sold at $2.50 last year and when the company was reorganized, two years ago, many shareholders refused to pay in the $2 per share required to wipe out the indebtedness and save their holdings, yet the price on Dec. 24th, '98, was $30.25.

IN the House of Representatives at Washington a California Congressman objected this week to the appropriation for the U. S. assay office at Seattle, Wash., claiming that it was established there for the benefit of a corporation with headquarters in Chicago. The appropriation asked for will, however, be made. California's two Senators called upon the U. S. Treasurer concerning reported discrimination against the San Francisco mint and in favor of the Philadelphia mint regarding shipment of bullion for coinage. They asked that gold be shipped from Seattle to San Francisco for coinage at the mint there, instead of to the Philadelphia mint, where most of it now goes. U. S. Treasurer Roberts said that that bullion would be shipped to San Francisco but for the fact that the express company charges $2 25 for transporting $1000 from Seattle to San Francisco and only $1.75 for transporting $1000 from Seattle to Philadelphia. He promised Senators Perkins and White that he would "take the matter up with the express company and try to get lower rates to San Francisco."

"YOUR paper is invaluable to me," writes a Rossland, B. C., mine superintendent. "There are more and better original articles in your paper than in any other mining journal," says a Jerome, Arizona, miner. "The MINING AND SCIENTIFIC PRESS is fought for upon its arrival; seldom is the wrapper of any other disturbed," is a Ward, Colorado, verdict. "The MINING AND SCIENTIFIC PRESS is looked upon as authority on all mining matters in this section," writes a Randsburg, Cal., mining man. "One page of 'Concentrates' is worth the price of a whole year's subscription," says a Butte, Montana, miner. "What I like most about your paper," says a Denver, Colo., smelter man, "is its spirit, kindly, progressive, independent and accurate." "Make it three copies for '99," writes a Baker City, Or., subscriber, "then maybe I can keep a file." "We tried the —— for '98," writes a Clancy, Montana, superintendent, "but must go back to the MINING AND SCIENTIFIC PRESS for the rest of the century anyhow." These are a few of many such received this week. They are indicative of what is said by so many: the judgment, verdict, criticism and candid opinion of critical readers every week in the year. Every year the circle widens; '98 was most notable for the great additions to the list of subscribers outside of California, though never before in its history had it so many readers inside that State's borders as now.

How to Build and Operate an Arrastra.

Written for the MINING AND SCIENTIFIC PRESS by E. L. BALLOU.

In selecting the site for a water power arrastra it is presumed that foresight will be used in having it easy to get ore to, and also to get in heavy rocks for drags and bed. This site is commonly on a flat above high water on the bank of the stream from which water is taken for power. So many ways of applying this water are in use that but one—in common use in this section—will be described. From 20 to 150 feet fall can be used; 60 to 75 is found to be a good working pressure, easily controlled and not liable to knock buckets from the wheel. About 35 inches of water at this pressure will give power enough. Of course, less fall will need more, and more fall will use less water. Unless a convenient tree is used for one upright, two mudsills, two uprights and one cap piece, with the necessary braces, will be needed, of suitable lengths and sizes to meet each case.

After grading off where needed, the center post, of heart cedar or oak, is put in, and deep enough to make sure of it remaining solid. The top of the post must be not less than 2 inches higher than the top of the staves surrounding the bed. The upper end should be hewed down until it is at least 1 inch smaller than the wheel shaft. An iron band is sometimes shrunk on. The bearing plate to support the wheel is now put in. This furnishes the starting point for measuring the balance of the construction of the arrastra. The frame can now be put up and braced. The upper bearing is bolted in place directly over the post bearing—use a plumb line to make sure, moving the frame, if necessary, to get the upper directly over the lower bearing. After mortising for the wheel and sweeps, driving the journals to place in each end, and shrinking on the bands, the shaft is raised to place and a sweep is put in and keyed up level.

A narrow circular trench is now dug for the staves. These may be of any convenient width and about 4 inches thick, of cedar, pine, fir or oak. Sawed stuff is not necessary, if reasonable care is used to have the edges trimmed fairly true; 3 ft. 4 in. is a good length for the staves. Provide a wide stave, or piece of plank, for the discharge opening. This opening should be 4 in. wide and extend down to 6 in. of the bottom of the stave. (See Fig. 5, *a* and *b*.) Proceed now to place the staves, using a vertical strip nailed on the sweep as a guide. See that the staves are kept upright in both directions, and that the tops are of uniform height. Secure as fast as in proper place with some loose dirt. Don't slight the proper placing of the staves, or it will be regretted when too late to remedy.

When the staves are in place and well tamped outside, the enclosed dirt is dug out to within 6 in. of the bottom of the staves and the laying of the bed proceeded with. To plank up under the bed is quite unnecessary.

In selecting the large bed rock, reject all under 16 in. thick. Creek boulders, with at least one reasonably flat surface, are preferred, as the comparatively smooth sides are easy to clear of amalgam. Begin at the discharge opening and see that a large stone is so placed that a crevice will remain from the gate to the post until the bed is worn out. It is better not to place any large rocks against the posts or staves, leaving about 6 in. next to each to be filled with smaller rock. (Fig. 2, *a*.) For filling between the larger rock, use convenient-sized rock and mill or arrastra tailings, if they can be got; otherwise use a not too sticky clay, in either case tamping in snugly with a stick or drill. Keep the bed level in both directions, and use rocks of uniform hardness. To keep the larger rocks from shifting, a small rock or two is dropped in between before tamping. (Fig. 2, *a*.) Good-sized crevices, with removable wedge rocks, are best for catching amalgam and can be cleaned up better. The discharge gate is arranged as indicated (Fig. 5, *a* and *b*). The small sections are removed as the bed wears down, the settled charge being run off directly from the bottom.

The wheel shaft should be not less than 18 in. in diameter for a 32-ft. wheel and 11-ft. bed. It may taper to 12 in. at the upper end. It is best made of red fir, with the sap removed. An iron band is shrunk on each end. For the lower journal a piece of 2-in. round iron or 18 in. of a wagon axle is used, with about 2 in. of good steel welded on to the lower end; the upper end square, to rest against the lower side of a sweep. The steel may be pointed or left square. With the square-ended journal a 3x3x$\frac{1}{4}$ in. steel plate and soft collar, with lugs, are used. With the pointed or rounded journal a 3x3x1 in. steel plate, with a suitable depression, is used, the collar being omitted. The plate and journal are tempered hard in either case.

For the upper journal a piece of wagon axle, with the cast iron boxing let into a piece of timber, the latter bolted to the cap timber, does very well, or a handy blacksmith can make suitable irons. Both journals should project 6 in. from the shaft. Don't make a somewhat common mistake by letting the cast iron boxing into the cap timber.

For sweeps 4x8 in. of split red fir, or tough oak, is used, one the length of the diameter of the bed, the other 2 ft. less. The lower side of the sweep mortices are 12 in. from the end of the shaft, and are both cut entirely through the shaft. One is 4x9 in., the other 4x12 in., at right angles to the first. Both are tightly keyed to place with hardwood keys, and the outer ends bolted or braced to the wheel arms when necessary; 4x4 in. is cut out of each sweep at the center, to allow them to be wedged down to a common level.

The arms—twelve in number for the largest wheel, eight for the smaller—may be of 2x4 in., 2x6 in., or 2x6 in. at the shaft end, 2x4 in. on the outer end, with 1x6 in. braces nailed to arm and shaft. The mortises are 6 ft. from the lower end of the shaft and are 2 in., with every third one 4 to 6 in. deep. Let the outer end of the arms be 3 in. higher than at the shaft, thus giving the wheel a little "dish."

For the inside of the rim of the wheel use two thicknesses of $\frac{1}{2}$x6 in. breaking points, and $\frac{3}{4}$x6 in. for the outside. Use clear stuff and use either green lumber or water-soak before use. Nail securely; also use a small carriage bolt occasionally, if necessary.

The buckets should be 6 in. long and wide or deep enough to reach the lower side of the rim. Keep the tops flush with the top of the rim and 12 in. apart. The buckets may be of wood and curved, as shown, (Fig. 3), or they may be of sheet iron of proper stiffness, shaped over a block of wood and fastened to wood backing. With proper care in making the rim and placing the buckets and nozzle, nearly as high efficiency can be secured from the water with this wheel as when using the more perfect wheels on the market. To regulate the speed, the nozzle may be secured to the pipe by a piece of rubber hose, or canvas wrapped with rope, thus allowing the nozzle to be moved on and off the wheel. Or the nozzle may be secured permanently to the pipe, using a short, movable piece of pipe to cut off the stream as desired. Round-nozzle tips, from 1 to 2 in., will be needed to suit the variations in weight of drags and supply of water. Square wood or metal nozzles, with a movable tongue to regulate the size of stream, may be used; but, if economy of water is any object, a round metal nozzle and proper-sized tip had best be used. A short covering will be needed over the rim of the wheel where the water strikes the buckets to keep the water from flying about too much.

To keep rain out of the bed, small braces are nailed from shaft to arms, extending a little beyond the

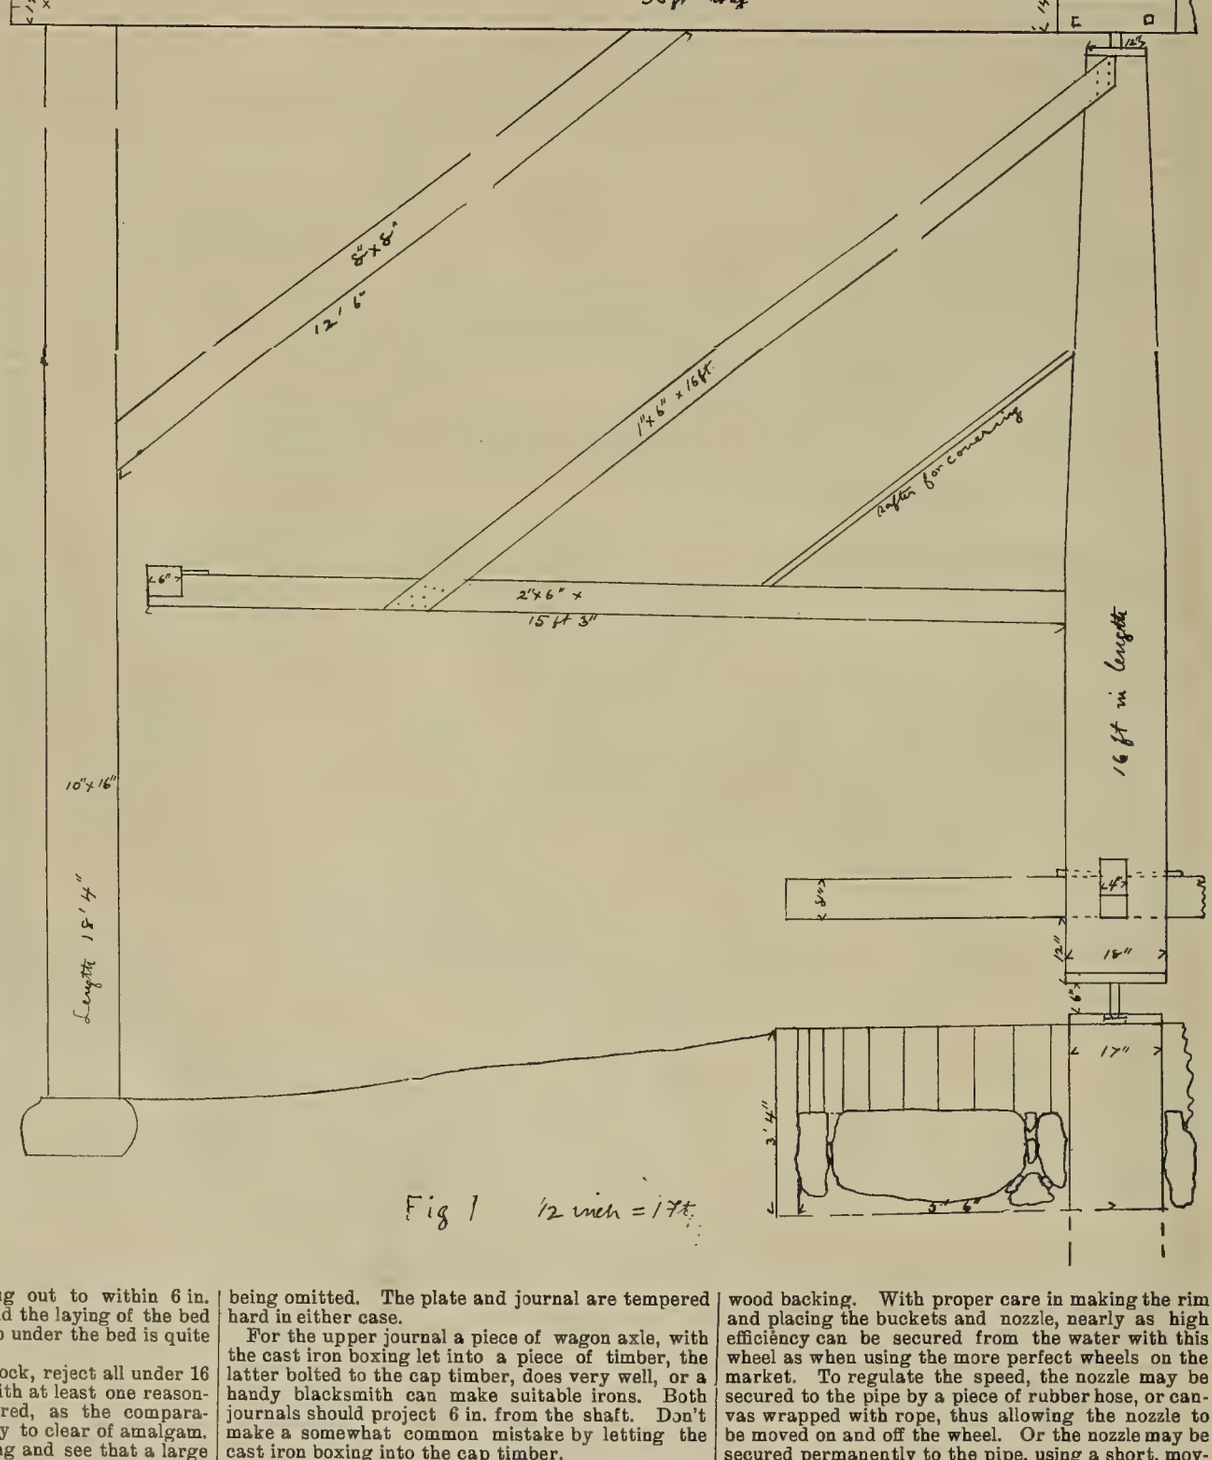

Fig 1 1/2 inch = 1ft

bed, and covered with sheeting or stakes, as fancy dictates. (See Fig. 1.)

The ideal drag is about 10 in. thick, 2 to 2½ ft. wide and long enough to just miss the sweep when entering nearly upright. (Fig. 4, *a* and *b*.) This will crush fast, spread the pulp well, and be efficient until worn almost entirely out. When a drag gets a large grinding surface it should be turned over, or a new one put in. The drags also need to be kept well up to the sweeps. To secure pins in the drags, drill 1¼ or 1½ in. holes about 5 in. deep. For pins use part of an oak sapling with a projecting limb, the green pin, with bark removed, to be somewhat larger than

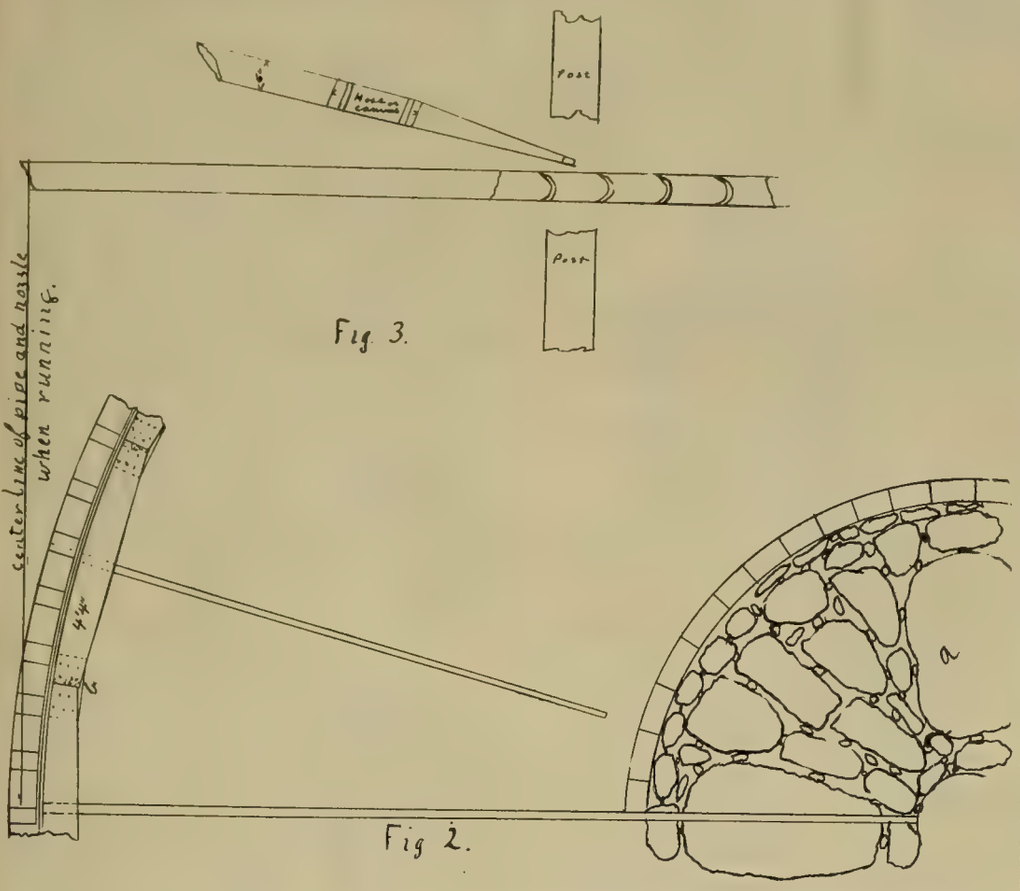

Fig. 3.

Fig. 2.

the hole it is to fill. When all is ready, place the small ends in a hot fire, turning often, so that the pins are quickly dried, but not burned. When cold, whittle until they will just drive with light blows of a sledge, being careful that the hook or former limb points down.

For fastening the drags to the sweeps, 1½ in. diameter best manila rope is usually more reliable and convenient than chains. Fasten to the pins with slipknot, take up all slack possible, so that there will be no moving of rope on the pin. Secure the loose end by wrapping stout string around it and the main rope. Fasten to the sweeps by wrapping at least twice around the sweeps and tucking the end through in front between the rope and sweep. The slack rope, being on the shaft end of the sweep, and the rope extending from the pin to the top and back side of the sweep, prevents chafing of the ropes. To take up the slack easily, move the wheel backwards a few feet by hand and block it; then place a small rock under the raised front edge of the drag, loose the wheel and secure the slack thus made available.

The drags are best arranged, to keep the wheel balanced: two smaller drags outside on the long sweep, the heaviest next the post, and one not quite so heavy farther out on the short sweep, works nicely in every way. Care should be used to keep the bed as near level as possible, for this allows of larger charges, crushes faster, saves the amalgam better, and adds to the life of the bed. By having small rocks next the staves and posts, these can be removed easily to help keep the bed in its original shape. The drags must cover the bed at each revolution of the wheel, and are moved in or out, turned over or replaced, as occasion demands. A movable trough is provided to carry water from the wheel to the bed, to allow of rapid filling when settling, and thinning the pulp when crushing.

When starting up with new bed and drags it will be necessary to run quite slow for a few days, and small drags had best be used. But, the crevices once well filled, surfaces worn on the drags and the bed worn smooth, about fifteen revolutions of the wheel can be given. Faster than this throws out too much pulp.

In running the arrastra, custom varies. If the water season is short, smaller charges and more of them are used to get ore through fast. It is then usual to run at least two charges per twenty-four hours. In any case only enough should be put in for a charge to insure its being ground properly at the desired time of drawing off. This will vary from 500 to 1500 lbs. per charge, and is put in as fast as the drags will spread it out. With heavy drags and hard ore the charge should have no piece of ore larger than walnuts. With softer ore and lighter drags lumps the size of a sledge do no harm.

A little practice will show how much water is needed to run until the "head amalgamator" comes around again—about noon, when the charge is put in just after breakfast. The necessary quicksilver can then be added, and, if two charges per twenty-four hours are run, it is ready to settle at supper time. A common practice is to run twenty-four hours on a charge, especially on ore carrying good value in very fine gold. The quicksilver is then added in the evening. In any case the pulp should be properly ground and gold amalgamated before settling and running off for a new charge.

For the quicksilver, a bottle with a piece of stout

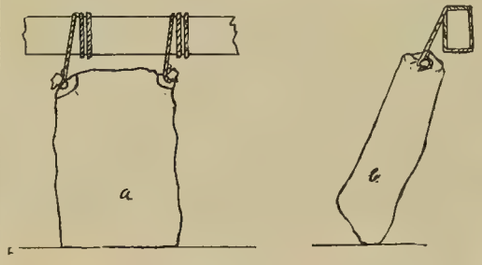

Fig 4

cloth tied tightly over the top is handy. By weighing full once and marking with a file at ½, 1 lb., etc., the exact amount used can be closely governed, and, after some practice and knowledge of the gold in the particular ore being worked, a very close estimate of the amount of gold in the arrastra can be had at any time.

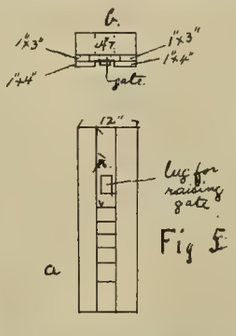

Fig 5

The amalgam should be kept quite thick, so that in the sample of pulp taken before settling it will just gather up into a ball, and, by pressing flat, will show no free quicksilver. To keep the amalgam thick too thin pulp will have to be avoided, and no quicksilver put in until the ore is fairly ground and the pulp thick enough to keep the quicksilver up. With pulp 4 in. deep and twelve revolutions of the wheel per minute, the bed can be seen for about 2 feet behind each drag when the pulp is the right consistency.

The coarser grinding digs up some of the amalgam and most of the extra quicksilver, and, unless the gold is very rusty or the ore extra rich, there will be little or no gold visible in the test taken in the afternoon, the amount of quicksilver called for being judged by the quantity of lead chip or snowflake-shaped amalgam.

If ore carrying much iron oxide is being worked, a charge can be thickened once, if desired, by adding a teaspoonful of salt. The result obtained by putting in so small an amount of salt will be astonishing the first time it is tried. The exact amount of quicksilver to be used must be learned by experience, the usual fault is to use too much.

The ore should be crushed until all will pass through a 60-mesh sieve. When properly ground and the gold amalgamated settling begins, by slowing down to five or six revolutions and water run rapidly in until about 12 in. deep; the wheel kept at this speed one and one-half to two hours. The discharge gate is then raised 6 or 8 in. and the wheel kept going until the bed is empty. The gate is then closed, a shovelful of tailings tamped in, when the arrastra is ready for the next charge. If everything is worked right no sand will be left in the bed after all the water is run out.

With clean quartz twice the bulk of water to bulk of pulp may be too much and with oxide of iron ore it may be too little. Where there is much difference in the grade of ore it is better to run the poorest ore first.

When ready to clean up let the wheel run after settling until all the water possible is run off. The balance is taken up with a sponge.

For special clean-up tools various devices are used. One is a steel tool about 12 in. long with pick point on one end and chisel point on the other, the points turned at right angles to the handle, sharpened and tempered. A small steel shovel 3 in. wide and 4 in. long is handy also. These are sometimes combined in one tool. A whisk broom is also needed. A water-tight box 4 ft. long, 1 ft. high, 2 ft. wide on the bottom and 2 ft. 6 in. on top, with a partition in the center, is provided near the bed.

A home-made trommel or screening device is also needed, unless the old-style rocker is used in cleaning up. This screen is made by nailing 1 in. square strips ⅜ in. apart around two circular ends fastened 20 in. apart on an iron or wooden shaft with a crank at the outer end. A section of the strips is fastened to independent segments working inside the ends proper, hinged on one side and hooked on the other. This makes a lid. This screen is placed in one compartment of the box, about half filled with clean-up stuff, closed, a small stream of clear water turned on and then revolved until the coarse sand and rocks are clean.

The coarse stuff is emptied where the lumps of amalgam can be picked out. The fine stuff is panned in the other compartment; or where a silvered plate is available, it is run over the plate back into the bed. Of course, after the bed is cleaned up, wedge rocks are put in place and any necessary tamping done. The coarse stuff is also put in, a little water added and the arrastra allowed to run a short time before putting in a charge of ore.

In cleaning up it is not often that the stuff next the post or the staves will pay to disturb. The stuff in the crevices is loosened with a pick, the material in the smaller crevices being worked towards the larger ones, the rocks scraped where amalgam shows and swept if a thorough job is to be made. Two inches is usually deep enough to go in cleaning out the crevices.

The cleaning and retorting of the amalgam is done in the same way as for gold amalgam secured by any other method.

The loss of quicksilver will vary from nearly all put in to three or four pounds per 100 tons of ore crushed, owing largely to the skill of the man in charge and richness of the ore.

The loss of gold is mostly in the sulphurets; the free gold being saved as close, or closer, than by any other amalgamating device.

But few chemicals are needed, a little concentrated lye occasionally being about all that is advisable. A little sodium amalgam in the quicksilver is sometimes good. Surface ore being often all that is suitable for an arrastra, it is safe as a general rule, to discard all chemicals, care being exercised to keep grease out of the pulp. Where the amalgam is squeezed use canvas in place of buckskin.

The expenses necessary in building an arrastra may vary from $75 to $1000 according to circumstances governing each case.

Ores carrying a heavy percentage of sulphurets are not suited to arrastra work, and the arrastra is the poorest device known to crush these kinds of ores for concentrating.

The running expenses vary. A set of ropes will

last from six to twelve months. The bed is good for twelve to twenty-four months. The wood work should last eight or ten years if well put together and of sound material.

The cost of attendance is from next to nothing to $200 per month. Under favorable circumstances ore going $2 a ton is worked—usually while opening up for better ore, or to keep the arrastra going while other work is on hand.

Some Experiences of a Working Miner.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS.

I have recently returned from an extended tour among California mines. One has always interesting and often amusing experiences traveling. I had heard of H—— and concluded to go there. I found it wide-awake. Everything was crude, method appeared nowhere, while makeshift was very much in evidence. Now there are good mines at H—— and things are running smoothly, but then it was different. I went to work in the Q—— mine, one of the largest and best in camp, but I didn't fancy it much—seemed too risky. Fancy a stope 60 feet wide, 100 feet long and 12 to 20 feet high, supported on single posts 10 to 12 inches in diameter, and many of these props bending and splitting under the weight of the overhanging mass of rock, and the stope increasing in size from day to day. I had not been there a week when I hinted to the mining boss that a more secure method of timbering and subsequent filling might be of advantage to all concerned. He admitted there was "room for improvement," but said the manager insisted on him furnishing 100 tons of ore to the mill daily and he had no time to devise or put in any better system of timbering. The trouble all lay in the fact that development was not carried on sufficiently in advance of the daily requirements of the mill to permit the work to be properly done, though this big stope could have been secured had the management not been so short-sighted in its policy of economy. To me it seemed suicidal to work in that stope, so I quit, rolled my blankets and tramped over to where Billy B—— was running a tunnel to cut the vein on the P—— mine. Billy knew how to run a tunnel all right, but did not appear to be at all particular as to the direction in which it was run. I went to work in this tunnel, which was in about 400 feet. After a few days I began to wonder how far it was expected the tunnel should be run before encountering the vein, so I inquired of Billy the object of running this tunnel. His reply was rather more forcible than polite. "To cut the vein, of course. What in h—— do you suppose it is for?" My reply was that I had not been able to discover unless it were to determine the horizontal distance through the mountain to the canyon on the other side. I then took Billy into my confidence and informed him that, in my opinion, his tunnel was running parallel with the vein and he would never reach it driving in that direction unless the vein made a turn. For this I got "my time" and the benefit of a few gratuitous and rather uncomplimentary remarks. I then "hoofed it" back to the railroad and struck out for a camp where a fellow's well-meant advice would be more highly appreciated. A few days later I read in the paper that the big stope of the Q—— mine had caved and, for a wonder, no one was hurt. Lucky, wasn't it? Since leaving Billy and his tunnel I have heard that Tom G—— succeeded Billy as boss at the tunnel which was then in 500 feet. Tom run a crosscut from the face 50 feet to the left and found the vein running nearly parallel with the tunnel. Billy had been deceived by the croppings near the top of the hill, not being able to distinguish between the true strike of the vein as determined on a level and the apparent strike as it appeared on the sloping hillside. This is a frequent source of error among miners. It was a long tramp from Billy's tunnel to the next camp, but it looked like a "ground hog case," so I struck out and in time reached I——. In this vicinity a number of small mines were at work. I found in this camp one of those remarkable feats of engineering that one sees from time to time when tramping around. There was a vein on the K. S. mine which dipped steeply into the mountain.

An inclined shaft had been sunk on this vein over 100 feet in depth. Upon the advent of a new manager a few months prior to my arrival this old and sensible shaft was abandoned and a new three-compartment vertical shaft commenced up on the hillside, the collar of this new shaft being 125 feet higher than the collar of the old one. The new shaft was sunk 100 feet at a cost of $10,000, and at that point lacked 25 feet of being as low as the collar of the old shaft. The work was stopped at that point and the mine abandoned. The money expended on the new shaft would have done a large amount of development on the vein or would have run a crosscut tunnel to the vein from the mountain side and reached the vein 500 feet below the croppings. This instance furnishes another example of how a mine should not be opened. I took a lease on part of a claim near I——, and, meeting with indifferent success "chloriding" a gold mine, I rolled my blankets and took the road again heading for A——.

There were a number of mines working at A——, the newest being the Shotgun. A crosscut tunnel was in 100 feet, which was farther than it had been estimated would be necessary to run to reach the vein cropping on the surface. This tunnel was extended 25 feet while I was at A——; but the vein not being found, the owner became uneasy and began to look for the reason. The suggestion was ventured that it might be well to do some work on the vein itself on top of the hill. This was done and a 15-foot hole proved the vein to pinch out entirely. To add to the distress of this good-faith investor, who was not a miner, it was found that the quartz did not even prospect. This property was abandoned.

Learning that some work was in progress on the P—— mine a few miles distant, I went up there and found several claims being worked in a small way. A mill was running on the P—— mine, the entire operation being under the direction of a shrewd and successful business man who had "money to burn" and the boys were helping to burn some. Here again I "put my foot in it," this time by asking foolish questions. One day during the noon hour I asked the man with "money to burn" how he was pleased with the result of his operations. He expressed himself as very well pleased indeed. His answer was so pleasant and withal gratifying that I ventured a few more questions. The gentleman volunteered the information: "I am not a mining man, you know, but I find it very simple and I will soon 'savey' the business." After this remark our conversation ran something like the following:

"How many tons of ore is the mill crushing, Mr. B——?"

"Well, really, I do not know—have no manner of weighing it, you know."

"The car holds 1600 pounds and I thought perhaps you had the trammer keep tally."

"No, I did not. In fact, I have been so busy that it has never occurred to me at all."

"I suppose, since you are satisfied, the ore is pretty good grade?"

"I can't say as to that; it is to ascertain this that we are running the mill, you understand." (This last in a patronizing tone).

"Are the sulphurets pretty good grade?"

"Well, now, really, I don't know as to that, but they are pretty fair, I guess."

"What percentage of sulphurets do you find the quartz contains?"

"I don't know, I am sure—quite a lot. How do you find that out?"

"By making as close a saving as possible; drying and weighing the concentrates. Then the relation of sulphurets to the ore from which they were obtained can readily be determined."

"Have you made tests on your tailings at regular intervals?" I inquired.

"No, but we are saving very close—*very* close."

"How do you know that?"

"The mill man told me so."

"Oh, then he has taken samples?"

"Not as I know of, but I guess he understands his business."

I noticed that he was becoming a little impatient, but ventured another remark. "I judge from what you have said yourself that you know but little more of this property than you did when you took hold of it. What do you expect to ascertain by this manner of working? You do not know the value of your ore as it comes from the mine; you do not know the capacity of your mill; do not know the percentage of sulphurets saved nor their value, and have no knowledge of the saving of free gold further than the statement of your mill man that it is very close. I fail to see where you are getting the much desired information."

The gentleman abruptly left me sitting on a log and wondering what he would do next. The following day I was enlightened. He shut the mine down and I with the balance packed my blankets once more.

MINER.

Largest Piece of Silver Ore.

TO THE EDITOR:—I wish to dispute the claim of the Smuggler mine at Aspen, Colorado, as having taken out the largest piece of silver ore ever mined.

In the year 1882 the Sierra Granda mine of New Mexico took out one chunk weighing over 10,000 pounds and the estimated value was about $80,000. A few days prior to taking out the big chunk I shipped one from the same mine to the Denver Exposition weighing 640 pounds, and when melted up it yielded a little over $10,000. I also shipped another chunk to Philadelphia weighing over 1200 pounds from the same property.

The largest chunk of silver ever mined, so far as we have any record, prior to the Sierra Granda chunk (called Jackson's Baby), was mined in Zacatecas, Mexico, many years ago, and contained a little over $51,000 in silver.

D. H. JACKSON.

P. S.—I was the manager of the Sierra Granda mine when these pieces were taken out. D. H. J.

Placerville, Cal., Jan. 9th, '98.

Storage Battery Development.

Of all branches of the electrical industry of this country, none has shown such a rapid growth during the last three years as storage battery work. Its enormous increase is shown by the following figures, representing the actual weight of storage battery installed, not reckoning containing cells, acid, etc., since 1894: In 1894 the plates used weighed 349,000 pounds; in 1895, 1,112.800; in 1896, 2,315,300; in 1897, 3,607,300; in 1898, 3,927,480, or nearly twelve times the weight of 1894. Only a very few years ago it was as much as an electrical engineer's reputation was worth to seriously recommend the use of the storage battery, and those who were associated with its exploitation received at the hands of the profession more pity than respect. Now the tables are entirely changed, and it is an exception to find an engineer who will not consider the use of a storage battery as an auxiliary in all cases of generation and transmission of electrical energy. It has many things in its favor. It renders a smaller generating plant necessary; it will do many classes of work alone, instead of requiring another electrical plant, as was formerly thought inevitable; it is economical, as its load is constant instead of varying, and its full efficiency is secured; it also saves money by reducing the depreciation on plants through avoiding the sudden throwing of heavy loads on them. The storage battery has had a remarkable influence on many other branches of electrical work. The electrical elevator was for a long time greatly retarded by the fact that it was considered necessary to operate it from a dynamo separate from that supplying the lights, or to sacrifice the steadiness of the lamps if they were both run from the same dynamo. The storage battery entirely overcomes this trouble, and there is now no need to complicate the electric plant in any building by adding hydraulic machinery. For years it has been the custom to refer to Europe for the most advanced illustrations on storage battery work, but this is no longer the case. The recent important installation in Chicago is 50 per cent larger than any battery in the world.

Not Subject to Relocation.

TO THE EDITOR:—There is a mine here supposed to be patented, but through mistakes made in survey is not. It was resurveyed Oct. 8th, '98, no assessment work being done for two years, with the exception of having a man around for a week or ten days about New Years. On Dec. 27th, '98, the company sent two men to the mine to work long enough to work out $100 as assessment work for last year. Was the ground open for relocation on Jan. 1st, '99? Can I hold same, having located and monumented it, peaceably and according to law?

The original owners having resumed work on the 27th of December, and according to the above statement from that time on continued to work the property until after the 1st of January, '99, the ground was not subject to relocation on January 1st. The resumption of work by the original owners prevents forfeiture.

U. S. Geological Survey Maps For Sale.

TO THE EDITOR:—It might be of interest to the general public to know that the topographic maps of the Geological Survey can be obtained of Dillon & Co., 310 California street, San Francisco, and I should be obliged to you if you would make this announcement through your columns.

H. W. TURNER.

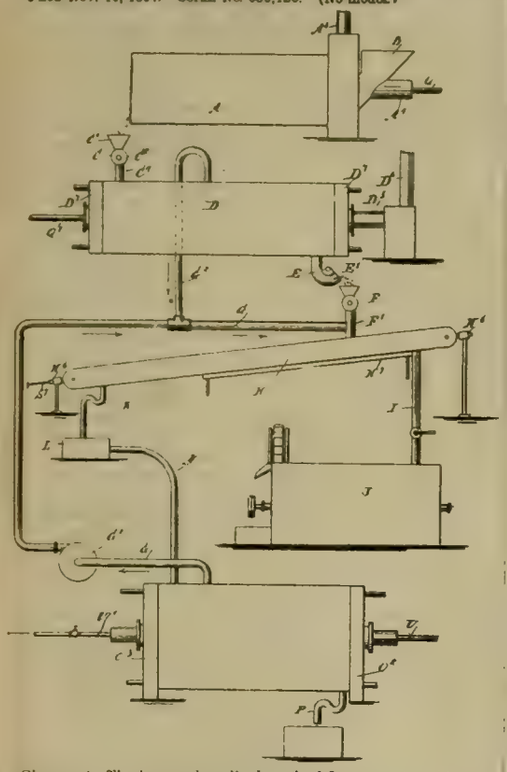
Dept. of the Interior, U. S. Geological Survey, Washington, D. C., Jan. 4th, '99.

AS A SUBSTITUTE for guttapercha as an electric insulator, German electricians report some degree of success by using a compound of ozokerite, amber and asphalt, heated in a retort, at a temperature of 400°, which liberates the volatile gases, the residue being employed in the manufacture of the insulator. This residue is of a blackish color, with the consistency of wax or dry rosin. It is claimed that it can be used in covering cables, being employed either alone or mixed with guttapercha, mineral powders or sulphur, and is said to have sufficient plasticity not to crack or break when the cable is bent or twisted. The best proportion to be observed in the manufacture of the article is fifty parts of ozokerite, forty-five of yellow amber and five of asphalt.

ACCORDING to *Electricity*, a bridge of 900 feet span at Budapest is being erected entirely by means of electrical machinery. The iron girders used as piles to keep the water back from the excavations for the shore pillars were driven in by an electric ram. The ram was a hammer rising 34 feet, with a velocity of 12 feet per second. The soil out of the holes was raised by an electric windlass. The water was removed by seven centrifugal pumps, working day and night. The 5-inch diameter pumps were driven by 10 H. P. motors, the 8-inch by 16 H. P., and 1-inch by a 20 H. P. motor.

Recent Mining and Metallurgical Patents.

617,226. METHOD OF AND APPARATUS FOR EXTRACTING BITUMEN FROM SAND. AUGUSTUS S. COOPER, San Francisco, Cal. Filed Nov. 19, 1897. Serial No. 659,120. (No model.)

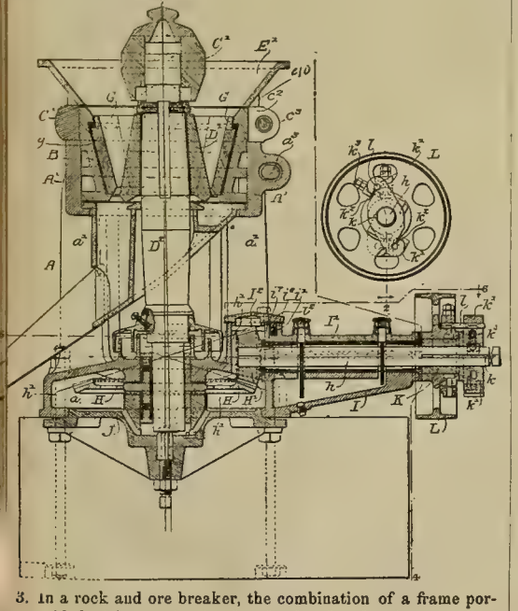


Claim.—1 The herein-described method for separating bitumen om sand, consisting in subjecting the material to the action of crude etroleum-oil to soften and dissolve the bitumen contained in the nd, and then subjecting the mass to the action of a benzin solvent r the bitumen, mechanically agitating the mass, separating the solu- on from the sand, evaporating the solvent from the asphalt, and turning the solvent in vaporized form to fresh portions of the oiled nds, as set forth.

16,659. ROCK OR ORE BREAKER. PHILETUS W. GATES and THOMAS W. CAPEN, Chicago, Ill., assignors to the Gates Iron Works, same place. Filed Apr. 30, 1897. Renewed Oct. 27, 1898. Serial No. 694,742. (No model.)

Claim.—1. In a rock and ore breaker, the combination of a frame base portion provided with an upper encircling portion, an annu- -shell portion provided with crushing-concaves inserted within the per encircling portion and having its upper portion projecting above same, means for securing the upper encircling portion and the nular shell together, a spider portion encircling the upper portion the annular shell, and means for securing it to the annular shell, stantially as described.

2. In a rock and ore breaker, the combination of a lower frame base portion provided with an upper circular portion split longi- inally, an annular-shell portion provided with crushing-concaves erted within the circular portion and having its upper portion jecting above the same, bolt mechanism for clamping the upper cular portion and annular shell together, a spider portion split lon- udinally encircling the upper part of the annular shell, and bolt chanism for clamping the spider portion to the annular shell, sub- ntially as described.

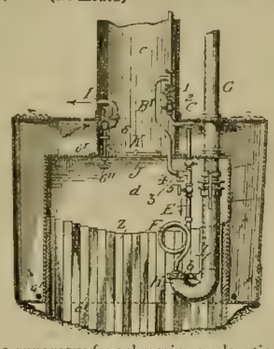


3. In a rock and ore breaker, the combination of a frame por- provided with a projecting bearing-bracket forming a part of closure of the oil-chamber in which the driving-gear mechanism rates, an upper removable box portion provided with a recess groove or channel arranged to hold a filling or packing material, and a cap portion arranged to be secured thereto and compress the packing so as to form a hermetical joint, substantially as described.

4. In a rock and ore breaker, the combination of a gyrating shaft, a horizontal driving-shaft gear, mechanism intermediate of such shafts to transmit power and motion from one to the other, a driving-pulley, lugs secured to the driving-shaft so as to rotate therewith and slitted longitudinally to form clamps, break-pins inserted in the clamp portions and in the driving-pulley, and clamping-bolts for closing the clamps to grasp the pins, substantially as described

5. In a rock and ore breaker, the combination of a gyrating shaft, gear mechanism for operating the same, a horizontal driving-shaft, a sleeve portion secured thereto, a driving-pulley mounted upon the sleeve, projections on such driving-sleeve slitted longitudinally to form clamps, break-pins inserted in such clamp portions and in the driving-pulley, and clamping-bolts for closing the clamps to grasp the pins, substantially as described.

616,567. APPARATUS FOR SUBMARINE MINING AND EXPLORATION. CALVIN BROWN, San Francisco, Cal. Filed Oct. 22, 1897. Serial No. 656,038. (No model.)



Claim.—1. In apparatus for submarine exploration, &c., the combination of a supporting structure, a pneumatic caisson, a discharge-pipe extending from the interior of the caisson upwardly, and having an open mouth within the caisson, a cover for closing said mouth, an air-supply, and a pipe connecting said air-supply with the discharge-pipe.

2 In apparatus for submarine exploration, &c., the combination of a float, a vertically-movable caisson carried thereby, a longitudinally-adjustable discharge-pipe extending from the interior of the caisson to the deck of the float, an air-supply, and an extensible connection from said air-supply to said discharge-pipe, substantially as and for the purposes set forth.

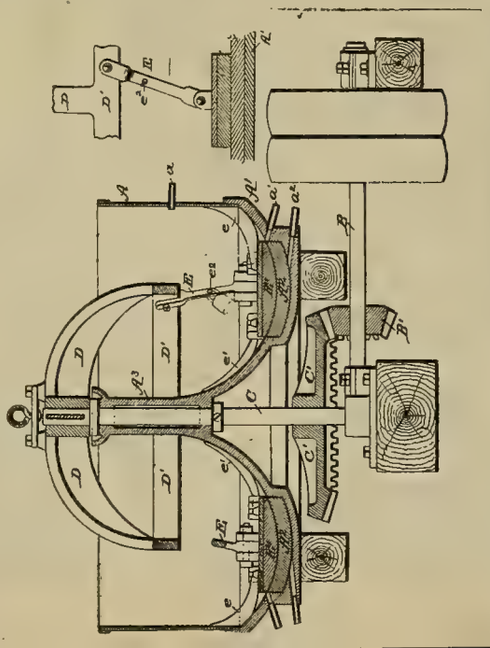
3. In apparatus for submarine exploration, &c., the combination of a float or scow, a caisson and air-lock carried thereby, sinking and raising compartments on the caisson, an air-supply, water inlets and exits to and from said compartments, and valves on the caisson and in the air-lock for regulating the supply of air and water to said compartments, substantially as set forth.

4. The combination with the float and its vertically-movable caisson, of a discharge-pipe extending from the interior of the caisson to the deck of the float and having an adjustable slip-joint, and an air-supply pipe having a flexible connection with said discharge-pipe, substantially as and for the purposes set forth.

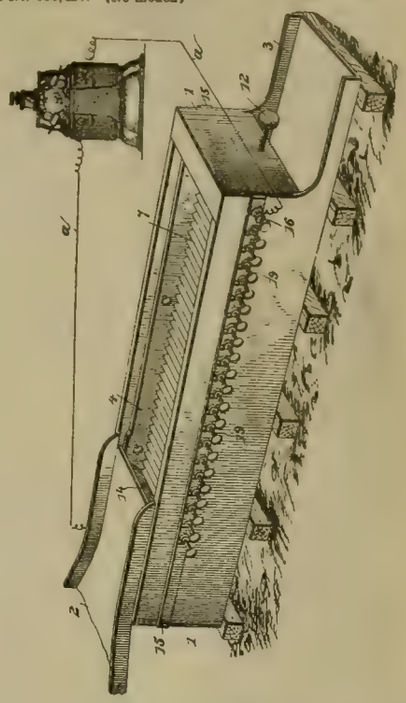
5. In combination with a pneumatic caisson, sinking and raising chambers connected thereto of pointed or wedge shape substantially as and for the purposes set forth.

616,915. ORE GRINDER AND AMALGAMATOR. JACOB GERSTLE, Portland, Oreg. Filed Oct. 26, 1897. Serial No 656,430. (No model.)

Claim.—An ore grinder and amalgamator consisting of a pan having a concave bottom A′ rising in the center in the form of a conical hub, and having an annular recess at its lowest point containing detachable flush-laid dies A^2, a superposed rotating frame D D′, inclined and pivoted trailing arms E having shoes E′ at their lower ends, said shoes being provided each with an outer scraper *e* and an inner scraper *e′*, and outlets *a a′* a^2 for the water and material substantially as shown and described.



617,024. ELECTROLYTIC REDUCING AND AMALGAMATING SLUICE. JOSEPH H. JORY, San Francisco, Cal. Filed May 27, 1897. Serial No. 638,427. (No model.)



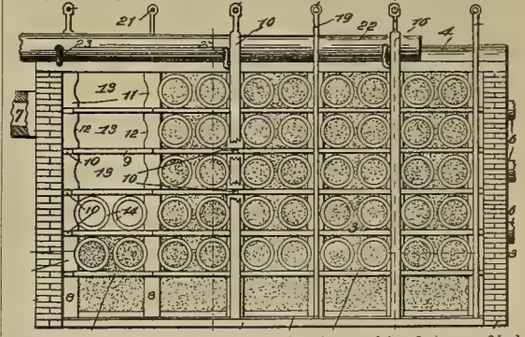
Claim.—1. In a reducing and amalgamating sluice, the sluice-box, a series of plates having at their opposite side edges pivot-studs, metallic contact-strips fitted to the outer sides of the box, and having electrical connections therewith, and a series of conducting-screws mounted in each of said strips, the series of screws at each side of the box having their inner ends engaged with the pivot-studs of every alternate plate, substantially as described.

2. A reducing and amalgamating sluice having a series of closely-arranged metallic plates with passages therebetween, suitable electrical connections for alternately charging the plates positively and negatively, and a readily-fusible metallic covering or coating surrounding the permanent negatively-charged plates, substantially as described.

3. A reducing and amalgamating sluice having a series of closely-adjacent plates with contracted passages therebetween, electrical connections for alternately charging the plates positively and negatively respectively, and a fibrous or similar protective covering incasing the alternate positive plates, to prevent direct metallic contact of the adjacent plates, substantially as described.

4. In a reducing and amalgamating sluice, the sluice-box, a series of closely-arranged plates having opposite pivot-studs loosely hung at opposite inner sides of the box, metallic conducting-strips fitted to opposite exterior sides of the sluice-box in the same horizontal plane as the pivot-studs, each of said strips having an electrical connection with one pole of a source of electrical energy such as a dynamo, and a series of conducting-screws adjustably mounted in each conducting-strip and working through openings in the adjacent side of the sluice-box, the series of conducting-screws at each side of the sluice-box being adapted to have their inner ends contact with the pivot-studs of every alternate plate, substantially as set forth.

616,475. ZINC-SMELTING FURNACE. ROBERT H. LANYON and WILLIAM LANYON, Iola, Kans. Filed Apr. 5, 1898. Serial No. 676,559. (No model.)



Claim.—1. The combination with a zinc-smelting furnace, of hollow buckstays forming a part of the side walls of the furnace, a series of solid buckstays arranged alternately with said hollow buckstays, air-inlet pipes discharging into the chambers within said hollow buckstays, there being openings formed through the inner walls of said hollow buckstays as required to distribute air and discharge it into the furnace, and retorts in said furnace with their outer ends adjacent said buckstays, substantially as specified.

2. A zinc-smelting furnace having side walls constructed of vertically-arranged pillars, plates having their ends resting on said pillars, which plates form a rest for the outer ends of the retorts within the furnace, there being air-inlet ports left between the ends of certain of said plates, the space around the outer ends of the retorts between the pillars and plates being filled with fire-clay, and means of conveying and discharging air through the ports to the interior of the furnace, substantially as specified.

Mill Practice of the Utica Mills, Calaveras County, Cal.*

NUMBER II.

By W. J. LORING, Angels Camp, Cal.

We keep a duplicate cam shaft, with cams and pulleys ready to take the place of a broken shaft, which we can thus replace in three hours, instead of at least forty-eight hours, the period otherwise required to strip the broken shaft, turn a new one to fit the cams, and get the ten stamps started again. If a cam shaft breaks we take it out, cams and all, and roll in the new one, with cams already fitted on it. After the two batteries have started again we can, at our leisure, strip the cams and pulley from the broken shaft and fit them to a new one, to be ready in case of another breakdown. I need hardly say that this arrangement saves much valuable time, as we are using sixteen cam shafts, each operating two 5-stamp batteries, and liable at any moment to break, thereby subtracting 10 stamps from the capacity of the mill until it can be replaced. The discharge is 10 inches high, three chuck blocks are used, and as the dies wear the chuck block is changed, keeping the discharge as nearly uniform as possible. Manganese steel shoes are used with very satisfactory results. They are 10 inches long, 8½ inches in diameter of face, and weigh when new 177 pounds, and after full use about 28 pounds each. Their life in service averages 296 actual days' work. These shoes are cast with hollow necks, that is a 2½-inch hole, 3½ inches deep, is cast in the neck, leaving ½ inch of metal around it. This hollow neck reduces the weight about 3 pounds, causing a saving of at least 25 cents per shoe in first cost, to say nothing of freight. We have used the manganese steel for both shoes and crusher plates since November, 1895, and have found it far superior to anything else.

The dies are made of hard iron and last 120 days. They are 5 inches high over all, 8¾ inches diameter of face, and 9⅛ x 9½ inches in base area. They weigh, when new, 84 pounds, and after using 41 pounds each. They cost 4½ cents per pound as delivered to us, and the old iron is sold to the foundry for 1½ cents per pound.

Round-punched "tin" screens are used; they are made in sheets of 10 x 14 inches. We use No. 1 (equivalent to 30-mesh), which lasts from 15 to 20 days. On clean ore—that is, ore free from chips—a screen will last 30 days. These sheets are burned over a mild charcoal fire before using; just enough heat to burn the tin is all that is required.* The superficial area of the discharge is 336 square inches. A splashboard made of ½ x 12-inch clear pine, having the full width of the screen, is suspended to the screen frame by two eyestraps, riveted to each end of the board, and two hooks, screwed to the screen frame. A strip of canvas or cloth 6 inches wide is tacked to the lower edge of the board, to confine the splash to the apron.

To the mortar below the screen is bolted an iron apron, the bottom of which falls 1 inch below the lip of the mortar, permitting the insertion of a 1 x 12-inch rough board flush with the upper edge of the lip of the mortar. On this the pulp falls from the screen. I have found this board to be a good amalgamator. After a rough board has been used for a month it amalgamates as quickly as a plate, but will not stand the jar like a copper plate. A splashboard used for this purpose can be cleaned in one-eighth the time required to clean a copper plate. This board is protected by a 2 x 6-inch board extending across the apron, and having a ⅝-inch hole bored in each end to receive two hooks fastened to the battery posts.

Four inches below the board, on the apron, runs a trough in which are two apertures 3 inches square, delivering the pulp on a copper plate 5 inches wide, with a pitch toward the mortar, whence it passes to the sluice plates, 2 feet wide, and furnished with 22 feet of $\frac{1}{16}$-inch copper plates set to a grade of 2 inches to the foot.

Of these sluices, each battery has two separate runs, set on independent sets of legs, with wedges to level each sluice independent of the other. Before putting on the plates the tables are dressed down in the center $\frac{1}{16}$ inch for the full length, causing the pulp to run in angular waves across the plate. If the tables are not dressed as described, but are left flat, the pulp will not run so evenly, but will tend to one side or the other. It is a hard matter, at best, to keep the tables perfectly level; and when they have been dressed down in the center, as described, it is much easier to control the flow of pulp.

The headplates—that is, the first 8 feet at the upper end of each sluice, are raw copper; the remaining 14 feet are plated with 2½ ounces of silver to the square foot. We do all our own silver plating at the electro-plating works owned and operated by the Utica Mining Co.

The plates are cleaned every morning, two men usually working together and each taking a plate on adjoining batteries. A plug of soft wood is driven into one of the 3-inch holes in the cast iron apron (described above), causing the pulp to run through the trough and out through the other 3-inch hole on the other plate. The plate they cut off is first washed with clean water, to remove all sand, then sprinkled with quicksilver, and then rubbed with a whisk broom, to loosen as much amalgam as possible. Every five or six days a weak solution of cyanide of potassium is used in dressing the plates. Great care must be exercised in applying cyanide to amalgamated plates. If too much is used they will become hard and glassy.

After the plates have been thoroughly treated with the whisk broom they are rubbed downward with a piece of 75 per cent pure india rubber gum, ½ inch thick and 4 x 7 inches in size. The amalgam is then taken up, together with all the sulphurets that may have adhered to the plates during the run of twenty-four hours. The plate is then lightly sprinkled with quicksilver at the head, as the case may require, and lightly brushed with the whisk broom for the full length. The last plate is always brushed upward from the extreme end, so that, in case any amalgam should be hanging to the edge of plate, it will be brushed up to where it can be readily seen and picked up.

By the methods described two men can dress twenty-four sluices, 22 feet long and 2 feet wide, in from one and one-half to two hours.

In order to save the sulphurets which are mentioned as having adhered to the plates, and which are very rich (sometimes yielding $10 per pound), the amalgam collected every morning is cleaned in a tank used for this purpose only. At the end of each month this tank is cleaned out and the sulphurets are charged, with 25 pounds of quicksilver, into an amalgamating barrel 40 inches in diameter and 48 inches long, which is run at about fourteen revolutions per minute, in which they are treated for eight hours. The charge is taken out through the head (not through the discharging plug, as ordinarily), with a dipper, and is panned and settled.

The amalgam is cleaned in the usual way, and the sulphurets are sent to the chlorination works in wooden buckets.

At the lower end of the sluices is a tail box, having the full width of two sluices, with a drop of 3½ to 4 inches, and a bottom 5 inches wide. This box has a wing, the full length of the box, with a pitch of about 45° towards the sluice, and extending to within ½ inch of the bottom of the box. The outlet is 1 inch above the bottom of the box. This wing causes the pulp to pass under it and keep the box clear at the bottom, catching the "drip quicksilver" which is certain to occur in a gold mill.

From this opening extends a sluice 12 inches wide and 8 feet long, the upper end of which carries ½ x ½-inch riffles, 2 inches apart, while below the riffles are 6 feet of silver-plated copper plates. This box has a grade of ⅞ inch to the foot, and from it the tailings pass to the concentrators, in which the sulphurets are saved.

Three concentrators are employed to each battery of 5 stamps. The Frue vanner, the Union concentrator, and the Tulloch, are all used, and all do fair work.† On each concentrator there is a sulphuret discharge, which deposits the sulphurets in a box directly under the head roller of the machine, and from this box the concentrated sulphurets are taken out every day. The use of this roller does away with the labor of hoeing out the sulphurets. All that is required is to settle the sulphurets and dip out the water, and they are ready to be shoveled out. A car holding 900 pounds of sulphurets is used to convey them to the dump house. Two samples are taken from each car with a 15-inch sampling iron, and after all the concentrates for the day have been taken out and sampled the aggregate sample is sent to the assay office, together with the aggregate of the samples of the final tailings, taken every three hours. These aggregate samples are assayed every day and a record of the result is kept. The tailings from the concentrator run through a flume three-fourths of a mile long and are worked over a canvas plant for the fine sulphurets lost in the concentrators. From the dump house the concentrates are conveyed one-fourth of a mile to the chlorination works, owned and operated by the Utica Mining Co. These works contain seven roasting furnaces and a cyanide plant, the latter being used only on the slimes recovered from the mill tailings after they have been passed over the Gates canvas plant above mentioned.

At the end of a run of from 15 to 30 days, as the grade of the ore may demand, a cleanup of the mill is made in the following manner: The feed is shut off from three batteries (15 stamps) until they have been "pounded out;" then the stamps are hung up, the battery water is shut off, and two rectangular pans, 15 x 14 inches in area, 3 inches deep on the high side and 2 inches on the low side, are placed in front of each battery, the low side of each being slipped under one of the holes in the apron. These pans are made of the form described in order to keep the top as nearly level as possible, so that the wash water will flow all around the top, and not tend to one place, as it would do if the pans were made of uniform height. The amalgam adhering to the screen frame is taken off with a scraper, made for the purpose, and deposited in a gold pan; the screen frame is then removed and thoroughly washed, after which the chuck block is taken out and placed in the cleanup room to be cleaned; the wooden apron is then scraped and the amalgam put in a bucket; then the coarse sand in the battery is shoveled out into a box made for the purpose; and then the pan with the cleanings from the screen frame is put under each stamp, which is thoroughly cleaned of any amalgam that may be found in keyways or between the bosshead and shoe. After each stamp has been thoroughly cleaned in this way the amalgam is taken to the cleanup room and ground with the chuck block amalgam from the same battery, the weight being kept for each battery separately. The dies are then removed and washed on the apron, and the battery is cleaned out, all the hard sand that has accumulated around the dies being put in the amalgamating barrel. After the battery has been thoroughly cleaned in this way about half an inch of sand is put in the bottom of the mortar, the dies are returned to their respective places, the coarse sand is put in, the chuck block (which by this time has been cleaned) is put in place, the screen is replaced and keyed, and the apron is thoroughly washed (as little water being used as possible), everything being cleaned down into the rectangular pans mentioned above. These pans, and the buckets used around the battery, are washed into the amalgamating barrel.

By the time the cleanup man has finished the washing of buckets and pans the man who is looking after the self-feeders has started the cleaned-up battery, and has its neighbor ready to be opened. Three men on the batteries and three men at the cleanup room can clean up twelve batteries in three hours.

(*To be Continued.*)

*Trans. Am. Inst. Min. Engs., Buffalo meeting, October, 1898.

†One reason for preferring perforated tin to Russia sheet iron for screens is the cost. Although the tinplate is in fact sheet iron tinned, it is cheaper than the Russia sheet iron. Tin sheets, 10 x 14 inches in size, cost about $1.35 per dozen, and 3½ to 4 sheets are required for a 5-stamp battery. Russia sheet iron screens cost from 40 to 75 cents per square foot, which makes them much dearer. Before using the sheets we burn (that is, oxidize) the tin surface to prevent amalgamation. It is well known that tin will amalgamate as readily as copper or even silver. If a tin screen were used without first burning off the tin, the formation of tin amalgam upon it would soon clog the discharge through it. Apart from the question of cost, however, and for reasons which I will not here undertake to explain, the tin screens are to be recommended. I have tried Russia sheet iron, both slotted and punched, and also wire cloth, and have obtained better results from the tin than from any other screen material. I think any millman who will make a trial of it will come to the same conclusion, unless he is dealing with conditions different from those which I have encountered, or can at this time conceive as essentially affecting this part of the mill process.

†We are using fifty-four 4-foot Frue, six 4-foot Union and sixteen 3-foot 10-inch Tulloch concentrators. From comparative tests of these machines I can find but little difference in the tailings. A special experiment made with the Frue vanner may be of interest to those engaged in milling. The machine has a shaking frame, 12 feet long and 4 feet wide. (Some are 6 feet wide, but we use the 4-foot size.) I dropped the back roller 3 inches by putting a block of wood between the side rail and the bearing that supports the roller. Then I took out enough of the small rollers that carry the belt to reduce the total length of the concentrator to 8 feet from center of head roller to center of small roller. From this small roller to the back roller I did not use any rollers in making my test. The belt from the small roller to the back roller had so much grade that nothing was saved on it, so that by this arrangement of the concentrators the effect was just the same as if 4 feet had been cut off from the back end. I had three vanners altered in this way, and made my test by assaying the tailings of these three against that of the 12-foot machines. This experiment continued for thirty-six days. The tailings assayed as follows:

	Per ton.
From the altered machine (4 x 8 feet)	$0.33
From the unaltered machine (4 x 12 feet)	0.41

or a saving of 8 cents per ton in favor of the sheet concentrator. If an 8-foot vanner will do as good work as one 12 feet long, there can be a saving in first cost, and in the cost of excavation and foundation, which in some localities is a large item.

Source of Placer Gold in Alaska.

Written for the MINING AND SCIENTIFIC PRESS by W. J. REYNOLDS.

On the islands and coast of Alaska the formation is granite with a slate contact. Wherever quartz ledges are found after crossing the coast range, lime, porphyry and slate predominate. Where lime abounds there seems to be no mineral: the country rock has all been thrown up with a second eruption. It is mixed together, bunches of barren quartz mixed in, all lying flat, no first formation on edge, and not a quartz ledge from the lakes down the river as far as this place, over 700 miles. Some of the cliffs here show slate, quartz and porphyry soldered together from the eruptions; the quartz is of such a fine rose character as would make a prospector look for gold in it. It is barren. The convulsion that came after the first formation mixed the ledges up with the country rock and the heat run the gold out of the quartz. Time and water worked it into channels and pay deposits. Some have been claiming that glacial action wore the gold out of the rock; if it did there would still be gold left in quartz rock not worn and ground fine. It is not a first formation placer like some of California, notably on Feather river, where the bedrock is on edge and quartz seams and stringers between. There the gold was made: instead of adhering to the quartz it formed in coarse particles in the clay seams between the rock. As the surface wore away the gold settled back to bedrock, and on the mountains around are quartz ledges. Here it is different: the ledges that have been are all scattered on the surface or soldered in bunches through the country rock. If any ledges are found here it will be in a different formation, one that has not been so disturbed. I have not prospected around Circle City yet; I understand from an old Californian it is of the same character. The Klondike has a good placer formation—slate, mica schist and quartz all mixed. When one hears of "mother lodes" being struck it is in the minds of inexperienced tenderfeet or schemers. This country is a good place for hardy, experienced miners, but others had better stay away.

70-Mile, Yukon River, Alaska.

Mining Summary.

Precious Metal Product for 1898.

Following is Wells-Fargo's annual report of the yield of gold, silver, copper and lead in the region where the MINING AND SCIENTIFIC PRESS has its largest circulation. The figures are furnished through the courtesy of Mr. Jno. J. Valentine:

The report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia and Northwest Territory), during 1898, shows in the aggregate: Gold, $78,461,202; silver, $33,016,565; copper, $46,200,648; lead, $13,344,251; total gross result, $177,022,666. The "commercial" value at which the several metals named therein have been estimated is: Silver, 58 cents per ounce; copper, 12 cents per pound; lead, $3.05 per cwt. Due allowance must always be made for probable variations from reported figures, by reason of the manifest difficulty of getting entirely reliable data from private sources. Estimates are sometimes liable to be exaggerated and are, to a considerable degree, guesswork; but, with some modifications on this account, the general results reached, while only approximately correct, may be accepted as the closest approximation possible under the circumstances:

STATES AND TERRITORIES.	Gold Dust and Bullion.	Silver Bullion by Express.	Ores and Base Bullion by Freight.	Total.
California	$15,402,653	$61,143	$2,639,255	$18,106,351
Nevada	2,709,785	695,580	100 168	3,505,542
Oregon	2,172,300	38,735	4,015	2,215,119
Washington	320,504	52,002	85,000	457,506
Alaska	3,253,991		67,500	3,321,491
Idaho	2,187,000	3,723,665	5 437,000	11,648,265
Montana	4,939,080	9,425,000	29,843,000	43,808,080
Utah	2,168,282	101,323	8,212 283	10,481,888
Colorado	23,177,202	14,456,559	3 682,823	41,316,644
New Mexico	304,866	73,295	1,324,765	1,704,866
Arizona	3,187,625	686,757	11,721,447	15,575,829
Dakota	6,575,220	95,000	34,300	6,704,420
Texas	5,250	275 850		281,100
Wyoming	21,225	26,750	4,300	52,275
Br. Columbia and Northwest Ter'y	11,975,000	3,035,200	1,753,000	17,663,200
Total	$78,461,020	$33,562,108	$64,999,356	$177,022,666

The gross yield for 1898, shown above, segregated, is approximately as follows:

Gold, 44 32-100	$78,461,202
Silver, 22 4-100	33,016,565
Copper, 26 10-100	46,200,648
Lead, 7 54-100	13,344,251
Total	$177,022,666

The year's combined product of the metals herein treated of is the greatest in the history of those countries—United States of America and British Columbia and Northwest Territory—that of gold, $78,461,202, being above any previous record officially reported; and the world's output of gold for 1898, being approximately $280,000,000. The most notable increases have been in South Africa $25,000,000, the British possessions of the Northwest $6,000,000, Australasia $6,000,000, and the United States $3,000,000.

ANNUAL PRODUCTS OF LEAD, COPPER, SILVER AND GOLD IN THE STATES AND TERRITORIES WEST OF THE MISSOURI RIVER, INCLUDING BRITISH COLUMBIA AND NORTHWEST TERRITORY, 1870-1898.

YEAR.	Product as per W. F. & Co. statements, including amounts from British Columbia and west coast of Mexico.	Product after deducting amounts from British Columbia and west coast of Mexico.	The Net Products of the States and Territories West of the Missouri River, Exclusive of British Columbia and West Coast of Mexico, Divided, are as follows: LEAD.	COPPER.	SILVER.	GOLD.
1870	$ 54,000,000	$ 52,150,000	$ 1,080,000	.....	$17,320,000	$33,750,000
1871	58,284,000	55,784 000	2,100,000	.....	19,286,000	34,398,000
1872	62,236,950	60,351,824	2,250,000	.....	19,924,420	38,177,305
1873	72,259,693	70,139,860	3,450 000	.....	27,483 302	39,206,558
1874	74,401,045	71,965,610	3,800,000	.....	29,699,122	38,466,488
1875	80,889,057	76,703,433	5,100,000	.....	31,635,239	39,968,194
1876	90 875,173	87,219,859	5,040,000	.....	39,292,924	42,886,935

1897	153,435,460	142,853,460	8,775,144	38,388,604	34,034,034	63,655,597
1898	177,022,666	159,350,466	11,804,251	45,807,648	35,081,365	66,486,202

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, $27,404,623; from San Francisco, $5,217,409. Total, $32,622,032, as against $48,412,009 last year. Pounds sterling estimated at $4 8665.

MEXICO.

STATEMENT OF THE PRODUCT OF GOLD AND SILVER IN THE REPUBLIC OF MEXICO REVISED AND CORRECTED FROM 1877 TO 1898.—VALUES UPON MINTAGE BASIS.

Years.	Gold.	Silver.	Total.
1877-1878	$ 747,000	$24,837,000	$25,584,000
1878-1879	881,000	25,125,000	26,006,000
1879-1880	942,000	26,869,000	27 742,000
1880-1881	1,013,000	29,234,000	30,247,000
1881-1882	937,000	29,329,000	30,266,000
1882-1883	956,000	29,569,000	30,525,000
1883-1884	1,055,000	31,695,000	32,750,000
1884-1885	914,000	33,226,000	34,140,000
1885-1886	1,026,000	34,112,000	35,138,000
1886-1887	1,047,000	34,600,000	35,647,000
1887-1888	1,031,000	34,912,000	35,943,000
1888-1889	1,040,000	40,706,000	41,746,000
1889-1890	1,100,000	41,500,000	42,600,000
1890-1891	1,150,000	43,000,000	44,150,000
1891-1892	1,275,000	45,750,000	47,025,000
1892-1893	1,400,000	48,500,000	49,900,000
1893-1894	1,425,000	47,350,000	48,675,000
1894-1895	4,750,000	54,225,000	58,975,000
1895-1896	5,475,000	54,450,000	59,925,000
1896-1897	8,500,000	60,683,000	69,183,000
1897-1898	9,925,000	67,525,000	77,450,000
Total	$16,589,000	$837,028,000	$883,617,000

EXHIBIT OF THE COINAGE OF MEXICO FROM THE ESTABLISHMENT OF THE MINTS IN 1537 TO THE END OF THE FISCAL YEAR OF 1898.

COLONIAL EPOCH.	GOLD.	SILVER.	COPPER.	TOTAL.
Unmilled coin from 1537 to 1731	$ 8,497,950	$752,067,456	$200,000	$760,765,406
Pillar coin, 1732 to 1771	19,889,014	441,629,211	.....	461,518,225
Bust coin, 1772 to 1821	40,391,447	888,583,989	342,893	929,298,328
INDEPENDENCE.	$68,778,411	$2,082,280,656	$542,893	$2,151,581,960
Iturbide's imperial bust, from 1822 to 1823	$ 557,392	$ 18,575,569	.....	$ 19,132,961
Republic eagle, 1824 to June 30, 1873	45,040,628	740,246,985	$5,235,177	790,522,290
REPUBLIC.	$45,598,020	$758,822,054	$5,235,177	$809,655,251
Eagle coin, from July 1, 1873, to June 30, 1898	$12,473,773	$598,304,756	$203,296	$610,981,825

SUMMARY.—Colonial Epoch, from 1537 to 1821, $2,151,581,960; Independence, from 1822 to 1873, $809,655,251; Republic, from 1873 to 1898, $610,981,825; total, $3,572,219,036.

EXHIBIT OF COINAGE OF GOLD, SILVER AND COPPER IN THE REPUBLIC OF MEXICO, FROM THE 1ST OF JULY, 1873 TO THE 30TH OF JUNE 1898.

YEARS.	GOLD DOLLARS.	SILVER DOLLARS.	COPPER DOLLARS.

Total	$12,473,773	$598 304 756	$203 296

SUMMARY.—Totals: Gold, $12,473,773; silver, $598,304,756; copper, $203,296; grand total, $610,981,825.

ARIZONA.

The Black Warrior Copper Co. near Globe has begun work on the Diamond H. shaft, and also to block out ore in the Montgomery mine, of the Black Warrior group. The Diamond shaft is down 135 feet and the last 50 feet is in sulphide ore. On the Montgomery there is a 100-foot shaft, a 350-foot tunnel and a surface cut showing good ore in all the openings.

Walter E. and F. M. Mendenhall are engaged in developing the Evergreen mining claims near Big Bug and are taking out good ore.——W. Miller and others have purchased S. Chadwick's mine and let a contract to drive a tunnel 250 feet on the ledge. This mine has produced ore by the carload that averaged fifty ounces silver, 50 per cent lead and some gold per ton.——M. J. Neary shipped to Kingman two carloads of ore from the Fourth of March and Samoan mines on Sherum Peak. The ore is high grade gold and silver.——Near Prescott the Senator mill has completed a run of forty-one tons of ore from the Senator mine, which yielded $30,000 in gold. The ore was from the 700-foot level.

The Mescal mill is being worked by J. B. Tomlinson, who is also sinking a shaft on the Sterling mine.——Dillon & White, in their Dexter group of mines near Prescott, will at once begin development.——The Midnight Test mine, on Groom creek, is yielding good ore. This is one of the oldest mines in Yavapai county.——The Champion mine, on Lynx creek, recently sold to M. Costello, has been patented, and it is the intention of the owner to thoroughly develop it.

Kingman *Miner*: The San Francisco mine near Kingman shipped a carload of eight-ounce gold ore.——On the Ben Butler mine a 3-foot ledge of $40 ore was found.——Watson & Co., working the Lady Bug mine at Mineral Park, have 130 feet of stoping ground opened up. The ore streak is a good width and shows ruby and native silver.——R. Gray on the Blue Belle mining claim opened a body of silver-gold ore of good grade.——In the Oro Blanco district the Ragnaroo M. & M. Co. are taking out valuable ore. The company are pushing a tunnel that will strike three veins at a depth of 500 feet. They have leased the Yellow Jacket's 20-stamp mill and will be crushing ore this month.——A number of promising claims are being developed in Mesquite district near Yuma. The Bay Horse Co., it is said, will soon run a pipe line to the Colorado river, eighteen miles and erect a stamp mill.

Yuma *Sun*: Ore running $300 per ton is being shipped from the Lucky Boy mine near Chloride.——The White Hills M. Co. in Mohave county increased its force of sixty men on the 1st.——The winzes and lower levels of the American Flag mine in Wallapai mountain, owned by D. W. Rosner of Denver, will be cleaned out and sinking resumed on the ore body.——Clack & Poland, leasers, take $1,000 a month out of the Oro Plata mine, owned by J. W. Gerritt. Fourteen men do the work.——About $25,000 was realized from a run of forty tons of ore from the new strike in the Senator mine in Yavapai county. The discovery is thought to be extensive.——Weaver district's Mother Lode group of mines has been sold to ex Gov. McIntyre of Colorado, who proposes to erect a 100-stamp mill and develop and operate the mines on an extensive scale. The price paid was about $100,000.

Bisbee *Orb*: The Copper Queen Co. at Bisbee have adopted a new departure for the handling of the slag from the furnace. A track will be laid from the furnaces to the track upon which the Little Queen is operated. On this track a small motor engine with cars attached will be placed, which will convey the slag from the furnaces to the Little Queen, where it will be transferred from the motor train to the big slag pots and taken to the slag dump and emptied. This will do away with the many hand carts so long in use at the smelter, and prevent the many minor accidents which happen in the handling of the slag.

Phœnix *Republican*: At the Ray mine a diamond drill has been placed and twenty-men are employed. Their principal work now is prospecting for a large body of ore so as to justify an outlay for extensive machinery. There is a blow-out of copper on the surface, which is of high-grade sulphuret ore, but they will go deep for the main ledge.

CALIFORNIA.

Butte.

The third dredger near Oroville, known as the Goodwin dredger, made a trial run last week and worked in a satifactory manner.——The cold weather caused the shutting down of the Gold Bank mine at Forbestown.

J. E. Poingdestre has organized a company and will open the Miller & Johnson quartz claim near Forbestown. Work will begin in the spring.

Calaveras.

(Special Correspondence).—The Spanish Bar M. Co., a San Francisco corporation, have begun work on their hydraulic property near Mokelumne Hill. They have six men at work.

The Smuggler Hydraulic Co. are ready for operations awaiting water which is promised them by March 1st from the Amador Ditch Co., who are repairing their property anticipating their ability to furnish abundant water supply the entire year.

The North Star Drift M. Co., since the recent storms have begun work on a large scale. They put sixty men to work. This property is controlled by a Chicago company. They have two and one-half miles of channel and will push operations all the season.

Mokelumne Hill, Jan. 7th, '99.

Heinsdorff & Schworer's mill is running on quartz from the Heinsdorff property near Murphy's, where F. W. McNear was recently operating, but quit work when connection was nearly made with the shaft from which this quartz is being milled.

Work on the Demarest mine near San Andreas is being pushed. A sump is being sunk at the 400-foot level and stoping has begun from the 300 and 400-foot levels.

Mokelumne Hill *Chronicle*: Davison & Fitzsimmons of San Francisco are operating the Favorite mine, in Esperanza district, under bond from Zumwalt & Co. A mill is contemplated.——B. O'Neill has a force at work on the old Prussian Hill mine.——Largomasino & Cavanna are sinking the shaft on the Bluebell mine. A vein 18 inches wide of $100 rock has been uncovered.——It is locally reported that the Hazel Dell mine will resume operations, and that the Fox mine near Angels will be reopened.

El Dorado.

(Special Correspondence).—The new mill on the Griffith Con. mine has been started and works successfully. Motive power is electric. The first cleanup at the end of the month will be big, as the ore is high grade. This is another of the mother lode properties abandoned many years ago at water level. A Scotch company began work on this about eighteen months ago and their development of the old property has been extensive and thorough. The same company operates the Jumper and other properties at Stent, Cal.

Adjoining the Griffith is the Larkin property, upon which development has been done about two years. The company is composed mostly of San Francisco merchants, and in a modest way they have assessed themselves every month to keep work moving until they have now a productive property. They have a 10-stamp mill in operation. The depth reached in the mine is nearly 500 feet.

The old Springfield mine, which was abandoned at a depth of 1700 feet some years ago, received attention about eighteen months ago from A. Harpending and Judge Williams. Work was started some distance from the old shaft, and the product has been surprisingly rich. Fifteen stamps are in operation during the day only and the daily cleanup is $1000. The company is about to sink a shaft in the footwall to a vertical depth of 500 feet.

In the Crown Point mine a large body of fair grade ore was struck last week. This property is being developed under lease by a Scotch corporation.

All the properties I speak of in this letter are on the mother lode between Nashville and Placerville.

In the Marguerite mine, upon which extensive work is being done by an Indianapolis company, work is progressing. A fair sized vein of high-grade ore was struck last week.

On the Ribbon Rock mine, also under development by Eastern people, encouraging results are met.

The Gold Bug Co. contemplates putting in pumping machinery.

McPhearson & Co., who began work recently near Placerville, have reached 100 feet depth and are in a large body of $6 ore.

Green Bros. are meeting with encouragement in the property they are developing. They are having their work done by contract.

The development of quartz properties in this county has assumed large proportions when the fact is borne in mind that only two years ago a very few properties were in oper-

ation and less received any attention to speak of.

In the eastern portion of the county, Senator Chapman is developing the Gold Note and Philadelphia properties extensively, employing nearly 100 men.

In the western part of the county a San Francisco company is expending much money in opening the old Unity mine, and the Boulder Co. is completing improvements upon its extensive property.

In the Kelsey and Georgetown districts work continues on the "going properties" and new ones are being opened.

All in all the county seems at last, after long waiting, to have received the attention of capital, and the owners of prospects or claims have also realized that it is of advantage to make concessions instead of holding undeveloped properties at unreasonable figures.

Placerville, Jan. 3rd, '99.

Placerville *Democrat*: The Montezuma mine, near Nashville, has been bonded to San Francisco people. Operations will begin soon. ——The Lone Star mine has been bonded to San Francisco capitalists, who will begin work this month.——It is locally reported that the Inez Central M. Co. will soon resume work.——The Last Chance mine is operated by C. A. Robert. Considerable development work has been done. He has a large ledge of ore averaging $6 a ton.——Purcell & Claresse are operating the old Marguerita mine.—— Near Placerville, in the Atlantic mine a strike of good ore was made last week.

Inyo.

At Wilson's canyon in the Argus mining district a 5-stamp mill is in operation day and night. Some ore is shipped which bears a 100-mile wagon haul and smelter charges.—— At Mountain Springs canyon the Inyo M. & M. are running a 3-stamp mill on good ore.

Kern.

Review: The output of the Johannesburg Reduction Works for '98 was $200,000. The dry-washing product was $100,000. These two make the Rand gold product for the year $1,-125,000.——The dry concentrator at the Hard Cash mine is handling twenty-four tons of rock per day, reducing twenty-five into one. The company treat the concentrates with settlers and amalgamating pans.——J. Woodrough put a small force at work on his Monitor claim.——The Wedge G. M. Co.'s report for '98 shows that about $35,000 was milled; all debts were paid; machinery amounting to $3000 was purchased; a new shaft put down and other improvements made. The December output was 121 tons. The first milling, for that month, of seventy tons gave $2200. Last week fifty tons went to the mill, which will probably average $40 per ton.——Fletcher & Balch, who are sinking on the Little Nugget near Garlock, ran fifteen sacks of ore last week at the Eureka mill, which netted $60 a ton.——In the St. George mine at Vanderbilt, A. G. Campbell has developed a 10-foot vein of base ore, running from $20 to $40 a ton, at a depth of 175 feet.

Madera.

Near Raymond hoisting works are being erected on the mining property undergoing development by S. Hopkins, Supt. Gold Hill mine at Grass Valley, Cal.

Nevada.

A. Scott & Co. have struck a ledge of good ore in a mine leased by them near Nevada City.

Grass Valley *Telegraph*: There was a cave at the Manzanita hydraulic mine near Nevada City last Monday night in which many acres of land slid accompanied by a roar that could be heard for miles. The cave carried with it huge trees and rocks and the bank which fell was 500 feet high. The earth had been loosened by the recent heavy storm.

Placer.

When the Pioneer G. M. Co., near Damascus, three years ago bought the property work had reached only to the 500-foot level. Since that time the company has put in No. 4 tunnel on the 1000-foot level. For the past year and a half pay ore has been taken from between the 1000-foot level and the 500-foot level. The company will run No. 5 tunnel at the 1500-foot level. During the summer a dam 100 feet in length, 30 feet wide at the base, 6 feet wide at the top and 23 feet in height was constructed across the American river, which will guarantee sufficient water to meet all the requirements of the property. There has also been installed an electrical plant which furnishes 300 H. P. During the past year the ore averaged from $9 to $17 per ton.

The Eureka Con. D. M. Co., near Forest Hill, for three years has been running tunnels, upraises and drifts, searching for the channel. Last November a year ago the east vein of the channel was located, but all efforts to find the west vein or opposite side were fruitless until last Saturday. This development has been anticipated by Mr. Chappellet. It is possible that the channel just found is not the main one. Experts have expressed the opinion that there were at least two channels in the Eureka ground.

Plumas.

J. Ghidotti is working, under a lease, the Star of Hope quartz mine, near Crescent Mills. The ledge is about 7 feet wide. Two hundred tons of ore milled paid between $4.50 and $5.

Hall & McGrath are opening up the Emerald quartz mine. The tunnel is in 200 feet and has cut across ledge matter 25 feet wide; twenty-one tons of ore milled $9 per ton.

L. Requa of Oakland is running a tunnel to tap an ancient river bed near LaPorte. The tunnel is in 6000 feet.

Quincy *Independent*: Operations have been resumed on the Green Mountain mine at Crescent Mill.

Riverside.

The coal mines at Elsinore are turning out several carloads of coal a day.——In the Virginia Dale district there is much activity in the development of properties. —— E. E. Fancher, in the Coriscaiana mine in the Pinacate district, has made a discovery of good ore.

San Diego.

In Pichaco district S. W. Dorsey is doing the assessment work on his group of claims. ——The Tarantula group is being developed with encouraging results.——Placer mining is being extensively prosecuted and much gold of this character is secured.

The Escondido gold mine, which was recently sold to Denver capitalists for $50,000, is to be developed by the new owners without delay. The mill has been started up and a 5-stamp mill has been ordered. The drifts and levels are being reopened and a new pump is being put in.——In the Uncle Sam mine a large arrastra is being put in.

Shasta.

(Special Correspondence.)—Both gold and copper properties in Shasta county are being sought by capitalists, and there is more of an active business interest in mining development among the old inhabitants who, Micawber-like, have patiently awaited present opportunities, than has been the case in twenty years.

The ores, that in portions of the county were either not understood or would not bear shipping, find a market in the local smelter, and this one feature has done much to bring Shasta county into notice for its mining possibilities.

There are at present experts in the county from Europe examining copper properties that have been brought to the attention of German capital. There are likewise New York and New Jersey companies represented in the examination of copper properties.

In the Old Diggings district, the National Consolidated mine has been enabled to start its mill since the rain set in.

The Lyons property in the same district, long since abandoned, is pending negotiations to be reopened.

The Sam Houston mine, on which a San Francisco company recently began work, has at 90 feet depth found a 3-foot ledge of $20 ore, which they are shipping to the smelter. I am told that they will build a tramway to the railroad at Hart station.

The Phœnix property near Shasta, on which work was abandoned years ago because of its low grade, is again being worked. The ledge is large, over 60 feet, and the ore years ago is said to have yielded from $2.25 to $4 a ton. A San Francisco capitalist is carrying on the work, and I am informed that if the ore will average $3.50 a ton he will continue operations and erect a milling plant commensurate with the property.

From the Black Spider mine at Keswick, on which work was resumed recently, a high grade vein has been opened, which was widened into a 2-foot ore body, maintaining its value throughout, running high in gold, with some silver and copper.

In the Muletown district, the Black Bear mine, which some years ago was a shipper to Selby's, but upon which the pay shoot was lost, has begun the search for the old chute. The 300-foot tunnel is being continued, and sinking the shaft from 150 feet depth will be renewed.

The recent snows and rain storms have given life and energy to mining and business generally. There will be an abundance of water, and there will be comparatively more work done on quartz and gravel properties in this county than it has experienced in many years.

The Uncle Sam mine, at Kennet, is reported sold to a company represented by F. H. Deakin of San Francisco.

Redding, Jan. 10th, '99.

Hurst & Morrisey are developing a property at Harrison Gulch. The shaft shows good ore. The tunnel is in 200 feet. The ledge is not large, but the ore is high grade.

The Redding *Democrat* is informed that the Golinsky copper property near Kennet has been sold to Lewisohn Bros. of New Jersey for $150,000.

Shasta *Courier*: The developments in the district of which the Mt. Shasta mine is nearly central will result in the erection of at least two mills for reduction of both free gold quartz and rebellious ores.

Sierra.

(Special Correspondence).—The Gold Bluff M. Co., who have resumed work on this old-time property near Downieville, are driving their operations on an extensive scale. There are four tunnels in the mine, the lowest of which is 2200 feet long and taps the shaft at 900 feet depth, and 375 feet below the Yuba river. I am credibly informed that they have a large ledge and that the ore is fair grade. Sinking is continued. The twenty stamps are dropping almost continuously. The same company is also operating another property near Downieville. The 5-stamp mill at present is idle, but will be started up before long. The people operating these two properties are also successfully operating extensively in Tuolumne county. They are a San Francisco company.

York & Sons are meeting with success in their Slug Gulch mine. They recently took out over $1700 in a few days. They do not make public the amount they take out, and my present information was gained incidentally.

The recent storms are making glad the many miners, who are now able to wash the winter's storage of gravel.

Downieville, Jan. 8th, '99.

F. R. Soward has sold the Phœnix quartz mine at Sierra City to N. S. Keith of San Francisco. The purchaser will let a contract to sink the shaft before starting the mill.

Siskiyou.

The Fernandez placer mine on Cherry creek is prepared for operations as soon as water is afforded. This mine yields $17,000 a year.—— The Little Wonder quartz mine on Cherry creek, is turning out well. The quartz body is large.——The Hunter mine on Cherry creek has 500 tons of ore on the dump.

The river miners on the Klamath have not been able to work much lately owing to cold weather and storms.

The Gum Boot quartz mine of Scott river has been taken by D. H. Moffat of Denver, Colo., who is making arrangements to work it on an extensive scale. He has let a contract for sinking a shaft 100 feet to test the ledge. ——Ironsides & Wadsworth in the Cherry mining district will make the first run in the new mill of ten tons as a test.

Trinity.

Redding *Searchlight*: From the present outlook the gold output of Trinity will be more than double that of last year. Hydraulic properties are preparing to operate on an extensive scale; smaller placer properties expect to do two years work in one. The larger quartz properties such as the Brown Bear, Chloride Bailey and Strode mines are looking forward to a good year.——T. O'Keefe has developed a good property on Buckeye creek above Lewiston and has about 100 tons of ore on the dump ready for the arrastra. A shaft sunk on the ledge 80 feet shows a good quality of ore.——M. Ryan and associates of Mendocino county have struck it rich at their quartz claim near Lewiston. They have sunk a shaft about 60 feet and taken out eighty tons of rock which is supposed to go $80 per ton. They will work much of the rock this winter through an arrastra.

Tuolumne.

The Rawhide mill near Sonora will resume operations soon.

COLORADO.

During 1898 the Consolidated Kansas City Smelting & Refining Co. even exceeded its usual annual extensive business.

The product of the Arkansas Valley works at Leadville for the year amounted to:

Silver, 3,174,336 ounces at 58¼c	$1,849,051
Gold, 75,479 ounces at $20.67	1,560,151
Lead, 18,155 tons at $72.60	1,318,053
Copper, 1,037 tons at $250	259,250
Total values	$4,986,505

The derivation of the above was as follows:

	Silver, Ozs.	Gold, Ozs.	Lead, Tons.	Copper, Tons.
Colorado	2,883,935	75,453	12,437	1,037
Idaho	284,324	21	5,692	....
Utah	6,075	3	26	....
Totals	3,174,336	75,479	18,155	1,037

The product of the Argentine works (estimating December) was as follows:

Silver, 7,836,086 ounces at 58¼c	$4,559,521
Gold, 241,834 ounces at $20 67	4,998,083
Lead, 39,535 tons at $72.60	2,870,245
Blue vitriol, 4,693 tons at $75	351,975
Total value	$12,779,824

The metals at the Argentine works derived from Colorado ores amounted to:

Silver, 538 ounces at 58¼c	$ 313
Gold, 2,764 ounces at $20.67	57,132
Total values	$57,445

This company also received at their El Paso works Colorado ore, contents as follows:

Silver, 7,352 ounces at 58¼c	$ 4,182
Gold, 2,417 ounces at $20.67	49,959
Total values	$54,141

The output of the American Zinc-Lead Smelter at Canyon City for 1898 was as follows:

Silver, 101,483 ounces at 58¼c	$ 59,113
Gold, 967 ounces at $20.67	19,988
Lead, 1,701,098 lbs. at $3.63 per 100	61,746
Copper, 351,186 lbs. at 12c	77,247
Zinc, 3,900,656 lbs. at 6c	234,039
Total	$452,133

The Omaha-Grant Smelting & Refining Co., with plants in Denver, Omaha and Durango, for 1898 did the following aggregate of business:

	Ounces Gold	Ounces Silver.
Colorado	178,885 50	4,369,826
Other States and countries	125,783 80	8,905,872
Totals	304,669 30	13,275,698
	Pounds Lead.	Pounds Copper.
Colorado	23,325,301	2,177,975
Other States and countries	86,500,232	1,655,245
Totals	109,825,533	3,833,220

The market values were:

304,669 ounces of gold, at $20.67 per oz	$6,297,514 43
13,275,698 ounces silver, at 58¼c per oz	7,733,094 08
109,825,533 lbs. of lead, at $3.63 per 100	3 986,666 85
3,833,220 lbs. copper, at 12 cents per lb.	459,986 40

Following was the production of the Globe Smelting & Refining Co., Denver, for 1898, (exclusively Colorado ores):

	Gold, Ounces.	Silver, Ounces.
Colorado	187,315	7,314,032
Outside	22,865	1,512,656
Totals	210,181	8,826,688
	Lead, Pounds.	Copper, Pounds.
Colorado	22,619,408	1,108,839
Outside	15,682,875	33,371
Totals	38,302,283	1,142,210

The value of product was:

Gold, 210,181 ounces, at $20.67	$4,344,826
Silver, 8,826,688 ounces, at 58¼c	5,141,546
Lead, 38,302,283 lbs., at $3.63 per 100	1,390,372
Copper, 1,142,210 lbs., at 11c	125,643
Total value	$11,002,388

The work of the Bimetallic smelter, Leadville, for 1898, was as follows:

	Tons of Ore.	Gold Ounces.	Silver Ounces.
Lake county	79,472	16,780	2,225,399
El Paso county	505	484	299
Pitkin county	7	....	891
Park county	7	3	42
Chaffee county	26	85	51
Eagle county	122	104	3,237
Mineral county	8,699	141	475,805
Totals	88,838	17,598	2,705,725
		Lead, Pounds.	Copper, Pounds.
Lake county		2,859,926	413,111
Eagle county		5,247	181
Mineral county		13,829	164,888
Totals		2,859,001	578,180

Values in ores:

Gold, 17,598 ounces at $20.67	$ 363,700
Silver, 2,705,725 ounces at 58¼c	1,581,910
Lead, 2,859,001 pounds at $3.63 per 100	193,782
Copper, 578,180 pounds at 12c	69,381
Total value	$2,118,773

Following is a statement of the metals produced by the Philadelphia Smelting and Refining Co. at Pueblo for the year 1898, the product for the month of December being in part estimated:

Silver, 7,520,823 ounces at 58¼c	$4,380 879 40
Gold, 164,811 ounces at $20.67	3,396,308 37
Lead, 50,841,902 pounds at $3.63 per 100	1,845,561 04
Copper, 5,805,002 pounds at 11c	648,450 32
Total	$10,271,199 03

For Colorado only (included in above) the values were:

Silver, 4,934,502 ounces at 58¼c	$2,874,347 41
Gold, 134,699 ounces at $20 67	2,784,228 83
Lead, 17,281,232 pounds at $3.63 per 100	627,308 72
Copper, 4,614,352 pounds at 11c	507,567 72
Total for Colorado ores	$6,793,452 68

Following is the value of the shipments of the Boston & Colorado Smelting Co. for the year ending December 31, 1898, at the prices actually realized:

	Gold.	Silver.	Copper.
Colorado	$1,304,720	$436,735	$195,252
Other States & Ter's.	40,352	153,448	195,252
Totals	$1,345,072	$590,184	$390,504
			Totals.
Colorado, total value			$1,936,708
Total outside			389,053
Grand total			$2,325,761

The output was divided as follows:

Gold, 65,073 ounces at $20 67	$1,345,072
Silver, 1,013,191 ounces at 58¼c	590,184
Copper, 3,684,000 pounds at 10.6c	390 504
Total values	$2,325,760

The Colorado Smelting Co., with its plant at Pueblo, did the following aggregate business in '98:

	Copper, pounds.	Lead, pounds.	Silver, ounces.	Gold, ounces.
Colorado	173,664	12,788,714	1,280,921	58,800
Other States and Territories	40,986	16,746,038	750.524	1,996
Totals	214,650	29,534,752	2,031,446	60,796

The values reached were:

Gold, 60.796 ounces at $20.67	$1,256,653
Silver, 2,031,446 ounces at 58¼ cents	1,183,317
Lead, 29,534,752 pounds at $3.63 per 100	1,072,109
Copper, 214.650 pounds at 12 cents	25,758
Total	$3,537,837

The National Smelting and Refining Co., South Chicago, on bullion dore bars and ores received from smelters and mines in Colorado, for the year 1898, December estimated, report the following:

	Lead, Pounds	Silver, Ounces.	Gold, Ozs.
Bullion—			
Colorado Smelting Co	26,610,702	1,954,594	66,278
Dore Bars—			
Pueblo Smelting Co		2,858,299	39,800
Ores—			
Colorado Smelting Co		49	388
Taylor & Brunton		124	1,088

Value of material handled:

Gold, 107,534 ounces at $20.67	$2,222,728
Silver, 4,811,066 ounces at 58¼c	2,801,446
Lead, 26,610,702 pounds at $3.63 per 100	965,968
Total values	$5,990,142

DOLORES COUNTY.

A 100-ton concentrator will be built at Rico by W. E. Hawley, who has leased the Enterprise and neighboring dumps, estimated to contain 524,000 tons of gold-silver ore of an average value of $6 per ton. Of the assay value 75 per cent is silver and 25 per cent gold. The experimental tests resulted in a saving of 90 per cent. The plant will be ready for work April 1.

CLEAR CREEK COUNTY.

The following report is made by Chamberlain & Co. of ore purchases made in 1898:

Gross tons of ore	4,800
Gross value of ore	$424,363 00
No. ounces of silver	605,375
No. ounces of gold	824.58
No. pounds of lead	1 079,994
Average net value per ton	$77.60

Dewey Bros. report as follows:

Tons ore shipped	5 352
Amount paid for ore	$211,321.54
Average per ton	$40.43
Ounces gold	1,496
Ounces silver	324.634
Pounds lead	2,450 855
Pounds copper	63,077

EL PASO COUNTY.

The Portland Co. at Victor bought four claims of the Morse G. M. Co. for $225,000, of which $60,000 was paid last week.——The Vindicator will sink 225 feet, which will make the shaft 850 feet deep.——The Ingham Con. Co. at Victor have decided to adopt the leasing system, in lieu of company work, for the further development of the property.——The Finn Leasing Co., operating the Morning Glory No. 2, sent out a twenty-ton shipment, which is estimated to return from $40 to $60 a ton.——Simmons & Co. made a shipment of ore from their lease on the Zenobia of forty-eight tons, of which twenty-three tons were eight-ounce ore, and fifteen tons was two-ounce ore.——Returns on a twenty-ton shipment from the Adams sublease of the Gold Sovereign were $43.80 a ton.

It is locally reported that an ore body 300 feet in length has been opened in the 700-foot level of the Victor gold mine, and that the vein is 15 feet wide.——The Minnie Bell mine near Victor is outputting sixteen tons daily.

Two cars shipped recently yielded $67 a ton.

The total output from the Union Co.'s properties for December aggregated 800 tons, the bulk of which came from the Orpha May.——The Anchoria-Leland is producing 600 tons monthly.——The Newland lease on the Deadwood is producing a carload every other day.——Dubois & Conrad, leasing on the Wallace of the Vindicator Co., shipped three carloads last week that ran from two to eight ounces to the ton.——Returns from a shipment from the Engineers' Leasing Co. from nine tons were $35, and the remainder $25 a ton.

The Victor *Record* is informed that Boston capitalists have secured a long time lease on the Moffat-Smith tunnel, and that work on the property will begin within fifteen days. The tunnel will pierce Gold hill from Cripple Creek gulch and has already been driven nearly 3000 feet. It will develop at depth a section but little prospected and prove of value for drainage purposes. The bore already carries away an immense flow of water and is effectually draining a large acreage on Gold hill.

GILPIN COUNTY.

The shipment of smelting ore and tailings from Black Hawk for December footed up a total of 253 cars or 4554 tons.

LAKE COUNTY.

The Mab M. Co. on the Wolfton lease, Leadville district, in December produced about 4000 tons of lead sulphide which, it is estimated, nets $35,000.——The Maid of Erin silver mines lessees shipped 3700 tons of the usual variety of ore in December.

The output of the Jonny mines for December showed a good increase. Twenty-five cars a day are being shipped. The mine is to be equipped with all the latest appliances for lighting, both for underground and surface. The new dynamos will have a capacity of 1500 incandescent lights and 118 volts pressure on the line. It will also furnish power for the motors.——The Leadville Pumping Association will soon receive two new station pumps; one is 22x10x12, the other will be 22x10x18. The water is at present being lowered 4 feet a day.——The Fanny Rawlings lease and the Big Four M. Co. have 140 men on the payroll. The Big Four shipped in December 250 tons of gold-copper ore. The Rawlings tonnage was 1500 tons of oxide and sulphides.——Douglas, Newton & Co., lessees of the A. Y. and Minnie mine and mill, produced in December 1327 tons of crude lead carbonates and lead sulphide concentrates. The commercial value of the same will reach $30,000.

SAN JUAN COUNTY.

The Congress mine near Silverton is shipping a carload of pay ore a day and will continue to do so all winter.——The Tiger is shipping twenty-five to thirty tons of mineral a day. There are fifty men working on the Tiger.

SAN MIGUEL COUNTY.

The annual report of the Tomboy G. M. Co. at Telluride, shows the production of the year to have been $328,055, the yield of 24,620 tons of ore obtained at a total operating expense of $277,710. The last six months produced 21,833 tons, yielding $314,930, at a cost of $179,237, including development work and improvements aggregating $47,262.

Considerable work is going on at the Attica mine at Ophir and frequent shipments are being made. A new body of ore has been cut which gives 18 inches of high-grade mineral. The mine will be kept in production the entire winter if snow does not interfere.

SUMMIT COUNTY.

The Victoria mine at Frisco is shipping four cars of gold ore per week.

IDAHO.

J. Warton, who has had charge of the South Peacock mine in the Seven Devils for a Boston company, has bonded the Green Vale copper claim near Cuprum for $10,000.——The Checkmate mine in Boise the past two years has been productive of many shipments of high-grade ore and will make another soon. The company has been prospecting new ground and has found a vein that is over 5 feet wide. In this a streak appears that yields an average of $100 in gold per ton.

The Idaho City *World* is informed that the Big Buffalo mine on Buffalo Hump, has been sold to Butte and Spokane men; $25,000 is to be paid in thirty days, $25,000 in ninety days, $100,000 in one year, $175,000 in eighteen months and $175,000 in two years.——The Lucky Boy ores at Custer City are worked over plates and Wilfly tables, saving about 67 per cent of the values. Tailings have accumulated to the amount of about 10,000 tons, and the company will put in a cyanide plant to rework them. At DeLamar next summer there will be three plants working on tailings.

Hailey *Times*: The company that bought the Crœsus group of mines and mill recently has begun work. They are putting in an air compressor to operate power drills. The price of the property is $100,000, of which $5000 was paid last week.

MONTANA.

Kempfer & Hegener, leasing the Copper Queen lode, near Neihart, have a 10-inch body of ore, which averages 100 ounces in silver and $4 in gold. A drift of 60 feet has been run on the vein, cutting a chute of ore which assayed from 88 to 200 ounces in silver. They contemplate putting on machinery to run the shaft 200 feet.

In the Antelope mining district, near Philipsburg, a 50-ton cyanide plant will be erected on the properties of J. A. Murray and S. F. King.

The concentrator at the Snowshoe mine shut down last week because of freezing of the water supply. The company has sixty men on its pay roll. The upper tunnel is in a distance of 800 feet. The main tunnel is in 1200 feet and is being pushed ahead by two shifts. The winze from this tunnel is 80 feet deep and still sinking in first-class ore. A hoist is being placed to carry this winze to considerable depth. As soon as this plant is completed work will be resumed in the double compartment crosscut tunnel. The mine is developing ore rapidly and will soon be able to keep in operation several mills on the property. There is a considerable quantity of both first-class ore and concentrates on hand at the mine, which is being shipped to the smelter at the rate of about forty tons a week.

The Bowers coal property, near Livingston, under lease to the Thompson Investment Co., has been opened up under the management of J. J. Coleman and is again in shape for production. The undertaking of putting the mines in condition for working a force of miners has been more difficult than was anticipated, on account of water, but this impediment has been overcome.——A dredge is being put on Cataract creek, near Basin. The machine takes more after one of the large steam shovels used by railroads. The machinery will be ready for operation in the early spring.

NEVADA.

The output of gold for Osceola this season is about $15,000.

At Stateline, G. A. Rice is in 200 feet on his tunnel and has encountered a body of good ore.——Wicks & Buell in the Mono tunnel are in 100 feet. The ledge assays $5 in gold.——The Creole mine has a body of ore which assays $20 in gold.——The Gold Haven property litigation has been settled and Jewell & Co. have resumed work and have struck a body of good ore.——The Gold Crown mine at Siegel, White Pine county, shipped to Salt Lake last week a car of ore showing 99.4 ounces silver, 22.4 per cent manganese and 60 cents in gold. This is the first company organized in this section and will be known as the Boston & Nevada. The property has two veins in its group. In one of these copper predominates, the ores showing from 18 to 25 per cent of that metal per ton. The other is silver-lead, assays showing from 25 to 35 ounces silver and from 50 to 65 per cent lead.——The Occidental M. Co. at Virginia made a shipment of six tons of concentrates and sulphurets last week to Selby & Co. at Vallejo, Cal.——Forty stamps are dropping in the Dexter mill at Tuscarora.

The Virginia *Chronicle* says that the passage of an appropriation bill at the coming legislative session to supply funds for the establishment of public ore reduction works in prominent mining districts of the State, where owners of small mines could have their ore worked at a cost that would pay a small interest on the outlay for the plant, will result in placing the author of such a measure with both feet in the middle of the road leading to immortality. So far the mining legislation in this State has been confined to tinkering with the statutes relating to the location of mineral ground until every conceivable obstacle is thrown in the way of obtaining title to mining ground by making it possible to rob the poor prospector of the fruits of his labor after developing a rich body of ore through some technicality, should there be a future contest for the ownership. The establishment of public reduction works under the plan mentioned above would result in a vast increase in the bullion product and wealth of the State and the doubling of its population in the next two years.

NEW MEXICO.

J. N. Warner, from the W. B. & A. mine near Pinos Altos, made a shipment of ore that ran 37 per cent lead, $8 gold, and good value in silver per ton.——The Pinos Altos G. M. Co. are doing a great amount of development work on the Pacific lode. At the Gillett shaft drifts are being run at the four levels. The primitive system of hoisting by buckets will be superseded by cars and elevator cages.

At Andrews the cyanide mill is running night and day. Last month the mill produced $6500. The Trippe is furnishing the ore, the production of which last month was 900 tons of milling ore and six cars of refractory ore, which was shipped to the smelter. The shaft is being sunk to the depth of 1000 feet. It is now down 215.——A deep shaft will soon be started on the El Oro claim, on which the cyanide plant is situated. The development of the El Oro consists of a 200-foot shaft and 1400 feet of drifts and tunnels. After development work on the mines warrants the expense and insure sufficient ore, a smelter will be added to the two mills now in operation.

Silver City *Enterprise*: Near Silver City the reduction works have built a new stack 110 feet high, through which the fumes escape from the furnaces. Little of the value gets out of the dust chambers, and that little is precipitated before reaching the top of the stack. The works are smelting from 110 to 130 tons of ore per day besides fluxes. Last week eleven cars of ore were received from the La Descubedero mine near Chihuahua, Mexico.——W. H. Newcomb is shipping two cars of iron ore per day from Legal Tender mine.—— C. Metcalfe has struck some rich silver sulphide in the Golconda mine.

OREGON.

Last week Godfrey & Tabor brought to Baker City the cleanup from their Red Boy mine; the run was less than one month. The amount of gold was 1494 ounces, valued at $15.95 per ounce making a total of $23,829.30. The Red Boy has a 20-stamp mill. It is estimated that the mine's yield for the present year will approach $350,000.

The Golden Key M. Co., who have a group of mines bonded in the Gold Hill district, last week made the second payment on their property. The final payment will be made in July. This is the property of which Lord Sudley of England is the principal and the property is the Braden mines.

Sumpter *News*: The La Bellevue mine is working. F. Cabell is pushing development work on his Onion creek properties. I. Clopp has a force at work on the Ajax and Savage. The Magnolia mine is showing well. D. Russell has thirteen men at work on his Canary group night and day. A force is taking out a shipment of good ore from the Cougar. Miller & Co. are developing the Phil Sheridan group. In the Banzette mine near Robinsonville, under lease to Keeton, Osborn & Co., they are taking out good ore. The Don Juan and Phœnix mines are both working. The Pyx, under lease to Mounts & Co. is sending out good ore. The Morning Glory at Robinsonville has an 18-inch vein of $60 free-milling ore and two carloads on the dump ready for shipment as soon as the roads are open in the spring. Weaver & Co.'s Golden Gate, the Belcher, belonging to Larson & Co., and the Imperial owned by Kelley & Cradlebaugh, are all pushing development work. The Little Giant, under bond to W. L. Vinson, is driving a 300-foot tunnel.

UTAH.

Preparations are being made at the Silver King mine at Park City for sinking the shaft which is 1100 feet deep. The greater part of the last three years has been spent in developing the large ore bodies on the 1100-foot level. Two hundred feet in depth will be added to the shaft and stations will be cut at the 1200 and 1300.——At Mammoth, the Ajax, on the 400-foot level, last week struck a good chute that yields good values.——The Geyser-Marion at Mercur last week shipped to the sampler 800 pounds of gold dust. The management has begun with the crushers at the mill running full capacity and with 150 tons daily going through the plant.——The South Sunbeam M. Co. at Silver City decided to let contracts at once for the prospecting of the ground.

The ore streak encountered in the Highland Boy mine near Bingham at 460 feet has been followed in the tunnel, which is over 15 feet in ore.——The Star Co. is running its new cyanide mill with satisfactory results. Late developments in the Star group show improvements in the quality of ore.——The Jumbo mine at Deep Creek is producing ore which shows 100 ounces silver and $20 gold per ton.——At the Queen of Sheba crushing continues day and night.——At a depth of 120 feet in the Showell placer at Bingham the channel was broken into and the ground shows a satisfactory yield. The Showell placer is owned by the Dalton & Lark Co.

At Tintic a streak of ore has been found showing chloride of silver.——The Buckeye at Tintic has let the contract to sink the main shaft 200 feet deeper.——The Northern Light shipped a load of high-grade ore last week.

The shaft at the Alaska, near Diamond, is being put to a depth of 400 feet.

At the annual meeting of the Alice M. Co. the old directors were re-elected, with J. R. Walker president, L. H. Farnsworth secretary. This company has paid $1,075,000 in dividends to date.

The *Miner* reports shipments of Tintic's camps last week of seventy-nine cars of ore, twelve cars of concentrates and two bars of bullion.

WASHINGTON.

(Special Correspondence).—W. L. Sanders, E. B. Palmer and associates, of Seattle, are developing several groups of mining claims on the west fork of Miller river, in King county, from five to eight miles from Skykomish. Some of the characteristics of this district are of interest.

In their S. S. S. group the vein, opened from the surface, is from 1 to 4 feet wide, with a quartz gangue, carrying lead, iron sulphides, gray copper and zinc; the Sunday group shows a quartz and granite gangue, is said to be 16 feet between the walls, with a 16-inch pay streak of gold and silver ores which runs about $32 per ton; the Little Una group of nine claims, outcrops in an iron capping from 50 to 75 feet wide, interspersed with streaks of quartz, calcite, granite, hornblende and iron pyrites. The mass of iron capping carries small values in gold, silver and copper, the pay streaks assaying as high as six ounces gold; the Lynn group covers a vein, claimed to be a true fissure, from 4 to 16 feet wide, bearing lead, arsenides, gray copper and chalcopyrite in a quartz, lime and granite gangue. These ores are well adapted to concentration and assay from $4 to $12 gold and from 6 to 100 ounces silver.

The Golden Tunnel M. Co., organized by R. V. Ankeny, John Thomas, George T. Gardner and A. W. Hager, of Seattle, are giving attention to a group of claims in the Salmon district, a few miles from the Great Northern, in King county. The discovery was made in a natural cave, 50 feet deep and 75 feet wide, where a body of free milling quartz was exposed. It is asserted that an average of forty assays resulted in $16 per ton of gold. The cave is on the mountain side and the vein is said to extend to the apex of the mountain, 1000 feet, as well as downward as far as exploiting has gone. This vein is claimed to run from 23 to 80 feet in width. WASCOTT.

Seattle, Wash., Jan. 5th, '99.

At Republic the tunnel on the Gold Hur M. Co.'s property is making progress. The ore assayed from $3 98 to $5 24.——The Georgie Reed and Bull Dog group of claims is being developed. The ledge is 32 feet wide. The assays average $8 50 a ton.

Last week W. C. Butler gave a receiver's deed of all the property of the Pride of the Mountains and the Monte Cristo M. Cos. to J. B. Crooker, the representative of J. D. Rockefeller in Everett. The price of the Pride of the Mountains was $167,501.95 and the Monte Cristo M. Co. $160,569 98.——At Republic J. E. Knowlton sold four claims for $6000.——A 400-foot tunnel has been started on the Merrimac.

Near Newport, Towle & Co. made a strike of 4 feet of galena.——M. Heller in the Lone Star and Hawkeye claims is developing a ledge that shows considerable galena and a little copper.——The Conquest shipped a carload of ore last week; twelve men are at work on the mine.——Kock Bros. have resumed work on the Flower mine.

In the Mary Ann mine has been opened a silver carbonate, the first in the camp. The ledge is 5 feet in width and is a clean body of ore.—— At Springdale in the Cleveland mine the ore showing is good and about twenty men are at work. It is expected that a large amount of money will be expended by the company for improvements in the spring. The Cleveland is owned principally by J. P. Graves and other Spokane people. The Gray Eagle mine is shipping good ore. There is not a claim in this neighborhood where depth has been reached that has not proved a paying mine.

Near Chelan, development work is progressing on the Eureka group of mines. Four new ledges have been found on the Little Jim and Dolly claims; one 18 feet wide, said to be steel galena; one 21 feet wide, carrying cube iron, showing gold and copper; another, 9 feet wide, showing gold and copper; and the fourth, 6 feet wide, carries cube silver. Work has also been started on a shaft on the Crystal Cave mine.

FOREIGN.

BRITISH COLUMBIA.

The shipments of ore from the Slocan division from July 1, 1898, to January 1, 1899, were 17,857¼ tons.

The value of the ore produced by the Rossland mines during the year ended, aggregates $2,084,758.12. The shipments were 116,697 tons. For the year ending December 31, 1897, the shipments were 68,000 tons, and the value of the ore mined was $2,100,000. In a single year the shipments from the mines were almost doubled, while the value of the output increased $700,000, or 33 per cent.

R. Thompson of the Eureka Con. Co. at Rossland contemplates the erection of a compressor and hoisting plant.——The largest mining deal since the sale of the Center Star mine, was made in Rossland last week; the B. C. mine in Summit camp, Boundary, was sold for $300,000 and $50,000 paid down.——The second payment by the B. A. Co. to the minority shareholders of the Le Roi Co. has been made. It amounted to $3,12½ per share. The shipment of the old matte from the Le Roi smelter at Northport is at the rate of a carload a day, the shareholders in the Le Roi Co. will fare equally in the distribution of the proceeds from these matte shipments.——G. B. McAulay has bought the Big Copper mine in Copper Camp near Grand Forks for $50,000 in cash. The Big Copper was bonded a few years ago by Col. Weir of New York, who, after developing it to some extent, threw up the bond. Since that time the property has remained undeveloped. The ore assays 12 per cent copper, six ounces in silver and a trace of gold.

MEXICO.

C. W. Hayes has secured the Amarillas-Cajon and Yaqui mines, in the Cerro Colorado district near Santa Ana, Sonora, and has put men in each mine to push operations. There are 1000 tons of ore on the dumps and before that is reduced more than sufficient ore to keep the mills running will be coming from the mines. The two shafts, down 200 feet each, will be sunk 250 feet deeper. The ledges in both mines are about 10 feet in width, and the ores run from $8 to $171 per ton. A lot of 400 tons some time ago yielded $8000 in gold bullion, and the tailings yield about $11 per ton.

At the old Magistral copper mine near Chihuahua a 100-ton smelter is being erected. At this mine there are 50,000 tons of ore on the dump——Smith & Turnier have out between 75 and 100 tons of high-grade ore from their Progreso mines near Sabinal.——From Oaxaca it costs $43 a ton to get ore to Monterey or Aguascalientes. Some miners are shipping their ores to Liverpool, finding it more profitable. It is locally said that an English company is about to erect a smelter in Oaxaca.

Two Republics is informed that S. Camacho has entered into a contract with the Government of the State of Nuevo Leon for the establishment in that State of several new smelters and for the construction of certain lines of railroad. The principal smelter will be constructed near the city of Lerdo, and will have a capacity of 300 tons per day. The other smelters will have a minimum daily capacity of 200 tons. Monterey has already three smelters and when the ones above referred to are constructed the State of Nuevo Leon will have more establishments of the kind than all the other Mexican States combined.——The ore brought to Chihuahua one day last week for shipment represented a value of $114,000.

On the Santa Rosalia mine a stamp mill has been installed as well as an air compressor and the steam pumps and engines in the mine have been replaced by machinery operated by compressed air. Previous to the change it was impossible for the men to work in some parts of the mine on account of the heat. The mill is now in operation and new bodies of ore have been struck.

BORNEO.

A. B. Snow, an American mining engineer, is at work on a Dutch concession up the Kahayan river. He says that when he and a colleague went up the Kahayan river some months ago, they found the country quite undeveloped; they were the first engineers to undertake work in that part of Borneo. It was a difficult task to get there, involving a journey of over 200 miles up the river, and there were many difficulties to be encountered when they started work. They drove a tunnel 160 feet long on the property of the company employing them, made crosscuts and found pay ore. One of the chief difficulties to cope with is the scarcity of good labor. The Dyaks would, like the Malays, work until they had collected a small sum of money. Then they "chucked it," and there was a dearth of workmen until poverty again asserted itself. There is a great difficulty in getting mining supplies; it is next to impossible to obtain necessary materials in the towns of Borneo. Even in the Singapore it is hard to get things wanted about a mine.

Industrial Notes.

—In '98 there were 3388 men engaged in coal mining in Washington.

—Mail matter now arrives in San Francisco 97 hours and 55 minutes from New York city.

—The net earnings of the Colorado Fuel & Iron Co. for November, '98, were $115,000. The fixed charges of the company are $490,800 per annum.

—Mine Inspector Owens thinks that unless the duty on British Columbia coal is taken off, the output of Washington State during '99 will double that of '98, which was about 1,700,000 tons.

—The Portland, Or., Water Committee proposes to install and maintain an electric plant of sufficient capacity to light the city. The city now uses 703 arc lights of 2000 candle-power each and 637 incandescent lamps of 26 candle-power each.

—The Northwestern Railway Co. has begun grading for the road to the Seven Devils country. It starts from Huntington, Or., and follows the Snake river, the distance being eighty-three miles. For the first ten miles there will be some tunneling and rock work, but after that the work will be easy.

—The annual report of Supervising Inspector General Dumont to the Secretary of the Treasury for the year ended June 30, 1898, shows that there were on the Pacific coast, at the date of compilation, 657 steamers of 117,238 tons register, compared with 35 vessels of 18,242 tons when the district was established in 1857.

—It is now proposed to raise $2,000,000 for a Pacific Ocean Exposition to be held in San Francisco in 1901. The California State Legislature will be asked for an appropriation of $200,000, and Congress for one of $300,000. The scope of the exposition includes the States of the Pacific Slope, and the Central and South American, Asiatic, Siberian, Australasian and Oceanic countries bordering on the Pacific ocean, including Hawaii and the Philippines.

—The Snoqualmie Falls, Wash., Power Co. expects on the 22nd prox. to transmit electrically the water power of the Snoqualmie Falls height, 268 feet, to the industrial centers of Puget sound. The hydraulic works and the thirty-mile aluminum transmission lines have been completed, and the electric machinery from the Westinghouse Co. is now assembling. The service will be over two separate pole lines, carrying four independent 25,000-volt circuits.

—An agent of a German steamship line was in San Francisco last week studying the conditions with a view of establishing a trans-Pacific line of German steamships with which to share in the increase of American commerce with the Orient. He casually remarked that the tonnage of the ships in his line was greater than that in the navy of the United States. The tonnage of that one line was more than one quarter as large as the total tonnage under the American flag in the foreign trade.

—In '98 the San Francisco & San Joaquin Valley built sixty miles of road in California on the main line to Bakersfield and the extension of the Visalia branch. In Arizona the Gila Valley, Globe & Northern was extended from Geronimo to Globe, fifty-eight miles, and the Santa Fe, Prescott & Phœnix has built a branch a little over twenty-six miles long. In Oregon the Astoria & Columbia River completed its line to Globe, laying forty miles of track, and the Columbia Southern was extended from Wasco to Moro, eighteen miles. In '99 over 500 miles new track will be built in the section designated and the State of Washington.

—In the U. S. Senate this week a bill was introduced to provide for a submarine cable between the United States and Hawaii, the Philippines, Japan, China and Australia. By its terms the Postmaster-General is authorized to contract with the Pacific Cable Co. of New York for the payment of $125,000 a year for twenty years for transmission of official messages from San Francisco to Honolulu, the line to be laid by December 31, 1900. Before December 31, 1902, the company will construct a line from Honolulu to Manila with an additional sum of $125,000 to be paid by the Government. Within four years the company shall lay connecting lines to Japan, for which $125,000 a year for twenty years shall be paid. The rates fixed between San Francisco and Honolulu are 35 cents a word, and to the farther points $1 a word.

—The torpedo boat Rowan, built for the United States navy by Moran Bros. of Seattle, Wash., made successfully its final trial trip, on the 6th inst., on Puget sound, making a speed of 27.62 knots per hour, which is 1.62 in excess of the speed required. The Rowan is a trim little craft, 170 feet long, 17 feet wide, 11¼ feet depth, drawing 5½ feet of water. The armament consists of four rapid-fire one-pounders and three torpedo tubes. The engines run at 360 revolutions per minute, developing a H. P. of 3200. It has a twin-screw propeller, has the standard air-compressor plant prescribed by the Government Ordnance Bureau, which compresses the air to 1500 pounds per square inch. There are now three coast-built torpedo boats—one, the Davis, built in Oregon, one, the Rowan, built in Washington, and one, the Farragut, built in California.

—The great interest in Asiatic commerce which other nations as well as the United States are now feeling is illustrated in a recent subsidy agreement made by the German government, by which it proposes to pay more than a million dollars a year for a fifteen-year term for the establishment of steamship lines to ply between its ports and those of Japan, China and Australasia and certain ports of Oceanica. That the German government and those of its citizens participating in its commerce should feel a special interest in the trade of the Orient is not surprising in view of the fact that its exports to that part of the world have quadrupled during the past decade. A copy of the contract between the German government and the Lloyd steamship line for the establishment and maintenance of postal and commercial communication between Germany and eastern Asia and Australasia has reached the Treasury Bureau of Statistics. It shows that the Lloyd Co. agrees to maintain for a space of fifteen years steamship lines running from Bremerhafen or Hamburg, Germany, by way of a Belgian or Dutch port through Genoa, Naples, Port Said, Suez, Aden, Colombo, Singapore and Hongkong to Shanghai, China, and back by the same route; a second main line through the same ports to Yokohama, Japan; also a main line through the same ports to Adelaide, Melbourne and Sydney, Australia; also branch lines from Hongkong to Shanghai and from Singapore to German New Guinea, and other ports in Oceanica. Four steamers are, under this contract, to be built for the Chinese and Japanese service, to be of not less than 6000 tons and equal to those of foreign nations in every respect, their plans to be approved by the Admiralty, and to be running, respectively, by Oct. 1, 1899, Jan. 1, Sept. 1 and Nov. 1, 1900. The steamers to be constructed for the Australian line are to be not less than 5300 tons, and also equal to those of foreign nations in every respect and subject to the approval of the Admiralty. All the ships are to be built in German yards and German material is to be used as far as possible, all Admiralty requirements to be carried out in them, putting them into condition in which they can readily be utilized for war purposes when necessary. The agreement provides that in cases of mobilizing the fleet the Chancellor can purchase the vessels on full payment of their value, or can hire them. The terms of the contract also provide that only German coal is to be taken on board at German, Belgian or Dutch ports of call, except by the special assent of the Imperial Chancellor; that in cases of German and foreign goods being simultaneously offered for dispatch the German goods are, if necessary, to have the preference, and also that the Chancellor may prohibit the importation of German, Belgian or Dutch ports of such agricultural products as may compete with those of German agriculture. The agreement provides that the German government shall pay to the Lloyd Co. 5,590,000 marks per year, payable monthly. (Value of mark, 23.8 cents.) This contract extends from April, 1899, for a term of fifteen years. The regular plan of sailing on the Japanese line must begin at latest in April, 1899. It is also announced that a Bremen firm intends to establish with steamers now being built for that purpose a steamship line on the Yangtse Kiang in China, to ply between Shanghai and Hankow. By the aid of these lines, which will connect with the subsdized lines running from Hamburg to Shanghai, German dealers and German interests will be in direct communication not only with Shanghai, which has two-thirds of the import trade of China, but also with Hankow, one of the most important commercial cities of China, and having a population of about 1,000,000. It is now being connected with Peking by railroad. Hankow is probably the most important of the distributing centers of interior China, being splendidly situated in the very heart of the country, surrounded by a network of rivers and lakes and reached by the largest ocean steamers; and when to this is added the railway system now under construction its importance as a distributing point for interior China is very great. Germany's exports the Asiatic countries have increased very rapidly during the past decade. Her exports to China in 1887 amounted to 14,309,000 marks in value, and in 1896 to 45,266,000. To Japan the 1887 exports were 6,398,000 marks, and those of 1896 35,611,000. To British East India they were in 1887 7,230,000, and in 1896 49,179,000 marks. To Dutch East Indies and the Philippines they were in 1887 5,849,000 marks, and in 1896 16,943,000. To Australia they were in 1887 7,470,000, and in 1896 29,247,00 marks.

Commercial Paragraphs.

THE Abner Doble Co. will furnish the hydraulic equipment for the Driesam mine, located near Arrastraville, Tuolumne Co., Cal., consisting of five whee's, hoist, compressor, rock breaker and blower, operating under 380 feet head. The wheels are 4 feet and 6 inches in diameter.

THE Vulcan Iron Works Co. at Seattle, Wash., is entering the field for the manufacture and sale of mining machinery on a scale that is in harmony with the spirit and growth of the mining industry of the Northwest. This company, which has been in business for a number of years, is just completing a new plant, comprising a three-story building, 120x207 feet in size, which is being equipped with modern machinery and appliances for all kinds of machine and engineering work. The main machine shop is 60x107 feet and every machine therein is new. The power for all lathes, drills, etc., will be electricity, transmitted from the Snoqualmie Falls power plant. The cranes and elevators will be run by compressed air and hydraulics. The pattern room, stock rooms, moulding and blacksmithing departments are being well equipped and fitted up. Two more large blocks for exhibiting mining machinery in operation and for storage are to be built. This plant as it now stands requires a force of over 100 men. Mr. Isaac Hulme, the general manager, states that he is preparing to bring out some new types of machinery for mine and mill work.

Catalogues Received.

CATALOGUE No. 54, Fraser & Chalmers, Chicago; Sederholm boilers for high pressures and large units; described and illustrated in detail with numerous tables.

Personal.

JNO. W. MACKAY is ill at the Palace hotel, San Francisco.

THOS. MEIN of Oakland, Cal., has returned from Mexico and Phœnix, Arizona.

C. A. BROCKINGTON has been appointed Supt. Omaha mine, Grass Valley, Cal.

MR. EVERETT SWARTZ, the director of the Wilmerding school, has arrived from Waltham, Mass.

W. J. SHARWOOD has returned from conducting cyanide operations at Marysville, Montana, to Berkeley, Cal.

F. H. DOOLITTLE has returned to San Francisco after a five years sojourn in Bulawayo, capital of Matabele Land, South Africa.

F. ZEITLER, Supt. Champion M. Co., Nevada City, Cal., is in San Francisco attending the annual meeting of his company.

R. H. CAMPBELL of Shasta county, Cal., now a prominent hydraulic mine operator in the Cariboo district, B. C., is in San Francisco.

EMIL LOBE of Seattle, Wash., was recently in San Francisco, purchasing machinery to equip a property in Ketchican district, southern Alaska.

N. W. CHAPMAN is succeeded as Supt. of the Buxton, Clinton and Portland mining companies at Deadwood, S. D., by J. A. Greenough.

CAPTAIN J. J. NILER, U. S. A., will have charge at Los Angeles, Cal., of the U. S. engineer work on the San Pedro, Cal., harbor, to begin in April.

THE January number of "Cassier's Magazine" has as frontispiece a good portrait of Geo. W. Dickie of the Union Iron Works of San Francisco and a biographical sketch written by John Richards.

SUPT. R. C. CHAMBERS of the Ontario and Daly, Utah, mines, has returned from San Francisco. He says it is useless to think of resuming work at those Park City properties with silver at its present price.

H. C. HOOVER of San Francisco, who for the last two years has been in Westralia in the employ of Bewick, Moreing & Co., has gone to the province of Szuchnan, China, to assume charge of that firm's mining interests there.

W. J. CLARK of the General Electric Co. has accepted the position of Gen. Mgr. of the foreign department, with headquarters at New York. In the reorganization of the foreign department Mr. D. Mazenet, who for five years has held the general managership, and has piloted it from its small beginnings to its present position as one of the foremost departments of the company, becomes managing director of the Mexican General Electric Co., with headquarters in the City of Mexico. In view of the importance which our recent foreign acquisitions and our improved relations with foreign countries will give to our commerce, especially in the field of electrical development, the scope of the foreign department will necessarily be greatly widened, and this department, already important, will, with its broader field of action, undoubtedly become the foremost in the company. It will have charge of all commercial relations between the General Electric Co. and all countries outside the United States. Mr. Clark's wide experience in foreign commercial matters particularly fits him for his new position. He has traveled through Europe, as well as in the countries south of us, and his familiarity with foreign methods and manners will stand him in good stead. His book," "Commercial Cuba," recently published, is already generally acknowledged to be the standard authority on Cuban commercial affairs. He will be greatly missed from the railway department, in the management of which he made a unique record.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FOLDING CAMP STOVE.—W. S. Ray, San Francisco, Cal. No. 617,122. Dated Jan. 3, 1899. This invention relates to the construction of a knock-down or folding stove adapted for easy transportation and which is readily set up to form a complete stove, with means for bracing and strengthening the parts with relation to each other. It consists essentially of top and bottom sections with interlocking grooves so that they may be slipped together and form a rectangular box, sockets fixed to the sections upon opposite sides with bars fitting said sockets to lock the bars together and form legs for the support of a stove and a firebox and oven, each having outwardly projecting flanges adapted to be suspended upon the inturned interlocking meeting edges of the top and bottom sections. Suitable dampers are arranged to direct the heat around and beneath the oven, and a removable or telescopic stove pipe is fitted to the stove behind the oven.

FAUCET FILTER.—W. H. Vance, San Francisco, Cal., assignor of two-thirds to F. W. Wolfe and E. D. Wolfe of same place. No. 617,133. Dated Jan. 3, 1899. This invention is designed to provide an economical and effective reversible filter which may be attached directly to a faucet. It consists essentially of a casing, the cap of which is adapted to be secured to the faucet, a hollow stem extending through the casing having an intermediate partition with openings above and below the partition so that water received into the upper end is discharged outwardly into the casing and is returned into the tube and discharged through the lower openings. A perforated cylinder is slidably fitted to the tube and carries the filtering material. When this filter is at the bottom of the casing chamber, the water passes from the outside into the interior and thence to the discharge. When the casing is moved to the top the water passes outwardly through the filter and returns through the lower openings to the discharge. In this manner the filter can be reversed at any time and kept constantly clean.

POLE OR SHAFT COUPLING BOLT FOR VEHICLES.—E. L. Lowe, San Francisco, Cal., assignor to S. Lowe. No. 617,107. Dated Jan. 3, 1899. This invention relates to a bolt to be used in conjunction with pole or shaft couplings of vehicles. It consists essentially of a threadless bolt having a head upon one end, a longitudinal groove or channel at the outer end, a raised guard or shoulder near the outer end of the bolt, out of line with the slot or channel and a threadless nut having a guide groove corresponding with the raised guard upon the bolt to guide the nut passing over the guard, a set screw passing through the nut and adapted to engage the groove or channel so as to lock the nut against the coupling lugs after the bolt has been inserted, the parts being turned by gravitation so as to retain the guiding groove out of line with the shoulder of the bolt and prevent its slipping off even if it becomes loosened.

PICK.—F. Kortick, San Francisco, Cal. No. 617,105. Dated Jan. 3, 1899. This invention relates to a locking device for removable pick points, for safety hook and like attachments. It consists essentially of a head having a shank projecting a right angles, a tongue or yoke passing through the shank with the ends pressing upon the parts to be locked and a removable key passing through the head and pressing upon the tongue or yoke to retain it in place.

CALIPERS.—J. H. Culver, San Francisco, Cal. No. 617,082. Dated Jan. 3, 1899. The object of this invention is to provide a means for setting a pair of calipers and then allowing them to be removed, and afterwards returned accurately to the point at which they were set, this being necessary where the part to be calipered is of such a nature that the calipers must be opened in order to remove them therefrom and afterwards returned to their adjustment. It consists sentially of curved legs pivoted together at one end, the other ends being adapted to open and close about the pivot. Clamping screws engage each of the legs at approximately equal distances from the pivot point and a bar having a longitudinal slot fits one of said screws so that when it is loosened it may slide back and forward upon the screw and may be locked at any desired point by clamping the screw upon it. The opposite end of the bar has a countersunk chamber with a slot extending outwardly from it through the periphery of the bar. The other clamping screw fits this countersunk chamber when the shank of the screw has been entered into the slot and when the two screws are set the calipers will be adjusted to the part desired, then by loosening the screw which fits the countersunk opening, the legs of the calipers may be entirely separated and this end disengaged from the bar so that the calipers can be removed. They may then be returned and the parts again connected, the clamping screw secured and the space between the ends of the calipers will be exactly the same as originally adjusted.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

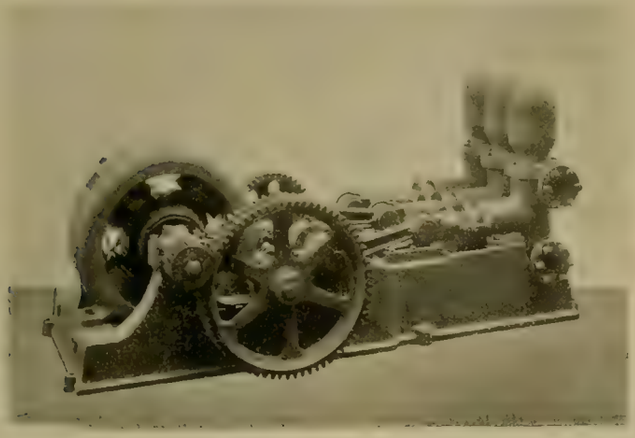
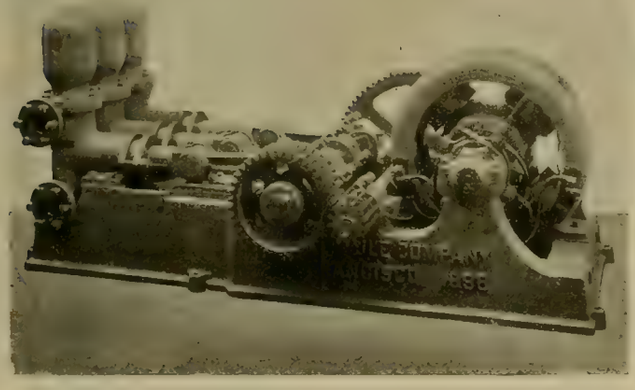
Electrically Driven Mine Pumps.

Herewith are two views—engraved specially for this article—of a small triple plunger, outside packed, special high duty electrical driven mine pump, manufactured by the Abner Doble Co., 200-210 Fremont street, San Francisco. This pump has a capacity of 108,000 gallons of water per twenty-four hours under a vertical lift of 500 feet. It is of the very latest type and is considered by its manufacturers to possess points of improvement over recent practice in designing direct connected pumps for mining purposes. This pump was mounted on a sled and thus used as a sinking pump for unwatering the mine for which it was made, where its use has already lowered the water 150 feet in the shaft. The Doble people make the additional point, that when the water is lowered to the 500-foot working level the owners of the pump illustrated will then have a first class electrical driven station pump, whereas, had they used the sinking pump, they would have been compelled to install a station pump at an additional expense.





THE DOBLE TRIPLEX ELECTRIC MINE PUMP.

Temperature of Battery Water, Etc.

To the Editor:—Having noted several articles on temperature of battery water, and having received great benefit therefrom, I will contribute my mite. Those who have been writing upon the subject may have forgotten more than I will ever know. But I am now experimenting with artesian water and, in my judgment, it is too warm. As it leaves the pipe, it is 80°; in the mill, 76°. I am using a Huntington mill, and we save 80% in the bullion well in the mill; it is very hard to save on the plates, as the quicksilver will run or wear off with the sand; the mercury on the plates is not firm enough to hold the gold. If we drop a piece of dry amalgam on the plates it will roll over and be coated with quicksilver, but will not hold to the plates. I do not believe it would stay on the plates in a battery with water at 70° or 76°; the splash would wear it off. If any of your readers have tried and found why it does not, I would like to know. I contemplate building a larger mill, and am experimenting with that view. My plates have but 1¼-inch drop to the foot, and they are hard to regulate even at that.

Austin, Nev. T. J. Bell.

A Few Questions Answered.

Ordinarily a multitude of questions are weekly answered in "Concentrates" on the third page of each issue, the questions themselves being omitted to save space, the answers being, virtually, publication of the questions themselves. The following was received from an Arizona subscriber after that page in this issue had gone to press. The questions are more varied than valuable:

What is the value of wolramite and sheelite ores? What is sheelite, and does it carry gold or any other valuable minerals? For what is wolframite used? Where can I obtain samples of platinum and cinnabar ores? What is ilvaite? What is lignite? What is meant by a tonstate of two or more minerals?

Sheelite is a calcium tungstate. Wolframite is a tungstate of iron and manganese. The value of wolframite and sheelite ores is dependent on the percentage of tungstic acid. No ore of less than 50% is commercially available, and the value runs from $1.20 to $1.40 per unit, but it must be free from sulphur and phosphorus. It is used for making a dense, strong, tough steel. Sheelite is obtained in commercial quantities in Trumball, Fairfield Co., Conn. In Arizona it is found connected with gold quartz. The United States consumed in 1897 seventy tons of wolframite ore; Europe uses about 600 metric tons per annum. Lignite is a brown coal formed from strongly compressed vegetable or wood fiber, that retains more or less the form of the original wood. It is a non-coking coal, with a large amount of volatile matter. Platinum can be found and obtained in many of the California gravel claims, in the black sand in cleaning up. Cinnabar ores can be had from any mineral dealer. Ilvaite is a brittle, dark-gray mineral containing silica, iron protoxide and lime, found in Elba, Tuscany, the Tyrol, Cumberland, R. I., and Somerville, Mass. The last question we are unable to answer.

Brunton's Patent Pocket Mine Transit.

The accompanying engravings illustrate a new pocket instrument which furnishes means for performing, within the limits of accuracy imposed by its size and construction, all of the operations for which the ordinary transit is used.

Fig. 1.

The instrument has been designed especially to meet the wants of mining engineers, mine managers and superintendents; but its peculiar features render it admirably adapted to the requirements of geological field work, the taking of topography, and, in short, to any purpose for which a light pocket instrument is desirable, and where a reasonable degree of accuracy will suffice.

Fig. 1 shows the instrument folded and ready for the pocket. An aluminum case covers all the working parts, its outside dimensions being but 2¾x2¾x1 inches and total weight less than eight ounces.

Fig. 2.

Fig. 2 is a plan of the instrument as seen when used for taking courses or horizontal angles and shows the line on the mirror bisecting the opening of the reflected sight.

Our limited space prevents us from illustrating but a part of this valuable instrument, but Figs. 3 and 4 will show its commoner uses.

Fig. 3.

Fig. 3 shows the method of holding and sighting the instrument when taking courses or horizontal angles, where the point sighted is not more than 45° above nor 15° below the observer. The instrument is correctly sighted on the object when the eye looking into the mirror sees the black center line bisecting both the opening in the front sight and the object sighted at.

Fig. 4.

In taking vertical angles the instrument is held as shown in Fig. 4. The open sight is thrown out parallel with the face of the instrument, with sighting end folded at a right angle. The mirrored lid is held at approximately 45° with face of instrument, in which position the eye can see the object sighted at through the round opening in end of sight and the hole through mirror. The clinometer vernier is operated by a lever from the back of the instrument and the mirror serves to show when the bubble in the level on the vernier is on the center, thereby indicating the angle. The lid may then be opened and the angle read direct from the vernier.

Among the noteworthy points characterizing the new instrument are:

1. The construction is such as to permit the sighting of the instrument and the reading of the needle to be performed simultaneously by a single observer. This is not possible with the ordinary surveyor's compass unless a Jacob's staff is used; and while the prismatic compass admits of simultaneous sighting and reading, the use of the prism introduces many disadvantages.

2. Horizontal angles are readily taken between objects situated at almost any angle above or below the observer.

3. The combination in one instrument of means for taking both horizontal and vertical angles, and for obtaining clinometer readings.

The pocket transit was invented and patented by the well-known mine manager, D. W. Brunton of Aspen, and is manufactured and sold by Wm. Ainsworth & Sons of Denver, Colo., who issue a pamphlet giving a detailed description of the instrument and its uses, and who will be pleased to send it to any desired address.

A Negative Opinion.

To the Editor:—Some time ago you had an article under the heading "Does Gold Volatilize?" I say no. If I may, I would suggest to the party who wrote the article to screen out all organic matter from his ore after becoming wet and assay same. I think he will be surprised, and can easily see where the gold went. T. K. Code.

Steeple Rock, N. M.

Youngs' Gold Dredge.

Articles at various times published in the MINING AND SCIENTIFIC PRESS on gold dredging or subaqueous placer mining have contained discussions of the subject generally, with descriptions and illustrations of the various types of dredges in use. In some of those articles the construction and operations of the dipper and ladder, or chain bucket, types have received special attention. The purpose of this article is to give a description of the mechanism of a new dredge of the suction type, with some observations as to its adaptation to the work of placer mining where the gold-bearing material is under water in the beds of rivers and lakes.

Youngs' gold dredge, which is to be described herein, was built specially for allaround work in the rough, swift-flowing as well as smooth streams of gold-bearing countries, and is adapted to meet the varied conditions found in all such streams. It has been exposed to the severest tests in the Northwest and its operators consider the inventor's claims for it fully demonstrated by those tests.

The dredging machinery proper is placed upon a barge or boat 135 feet long, 32 feet beam, drawing 2 feet of water. The main features are a 24-inch specially designed centrifugal pump, driven by a compound condensing engine of special high-speed pattern, a triple-drum hoisting engine, a turntable and a suction pipe, terminating in a rock ejector and plow blade. The mechanism of the equipment, with reference to the accompanying cuts and drawings, is described further on in the article.

The plow blade, which is at the submerged end of the suction pipe, cuts and plows through the gravel to the jagged and serrated bedrock, loosens the material in which the free gold may be held. It rakes the bedrock, moves boulders, opens crevices, enabling the hydraulic suction to reach places where the gold particles may be lodged.

The weight of the suction pipe and fixtures upon its vertical position, together with the pull exerted toward the boat, always keeps the suction down and over the material to be raised, and the smooth, easy manner of loosening the gravel by the plow blade does not disturb or agitate the gold, only as it is passed over. This gives the gold no chance to float away before the suction reaches it. By carrying its "breast" behind it, as it does on the downstream side, and by working to a common center, all that is loosened by the pipe will be kept within reach of the mouth of the suction by the natural current of the stream and the force of the suction itself.

By means of the rock ejector at the end of the suction pipe, the latter can be quickly cleared of rocks which may become jammed into it. This automatic removal of rocks which obstruct the suction obviates the difficulty which heretofore has been the great hindrance to the success of centrifugal pumping plants.

The motion of the end of the pipe is 25 feet; the swing of the turntable is through 150 degrees, making it possible to dredge an area of about 2000 square feet without moving the boat.

The method of saving the gold, of separating it from the material pumped up, is a question of gravity applied to a system of sluices on the boat, a double line of which extends the length of the boat on either side, the material first passing through an improved rotary grizzly of special design.

This machine has been used on the Fraser river and two of them are being constructed for use next year on Forty-mile river, a tributary of the Yukon.

The inventor of this dredge and the Youngs' Gold Dredger Co. claim these points of superiority: 1. That it will penetrate the gravelly bars in the stream and reach the gold in any pocket or cavity in an uneven bedrock.

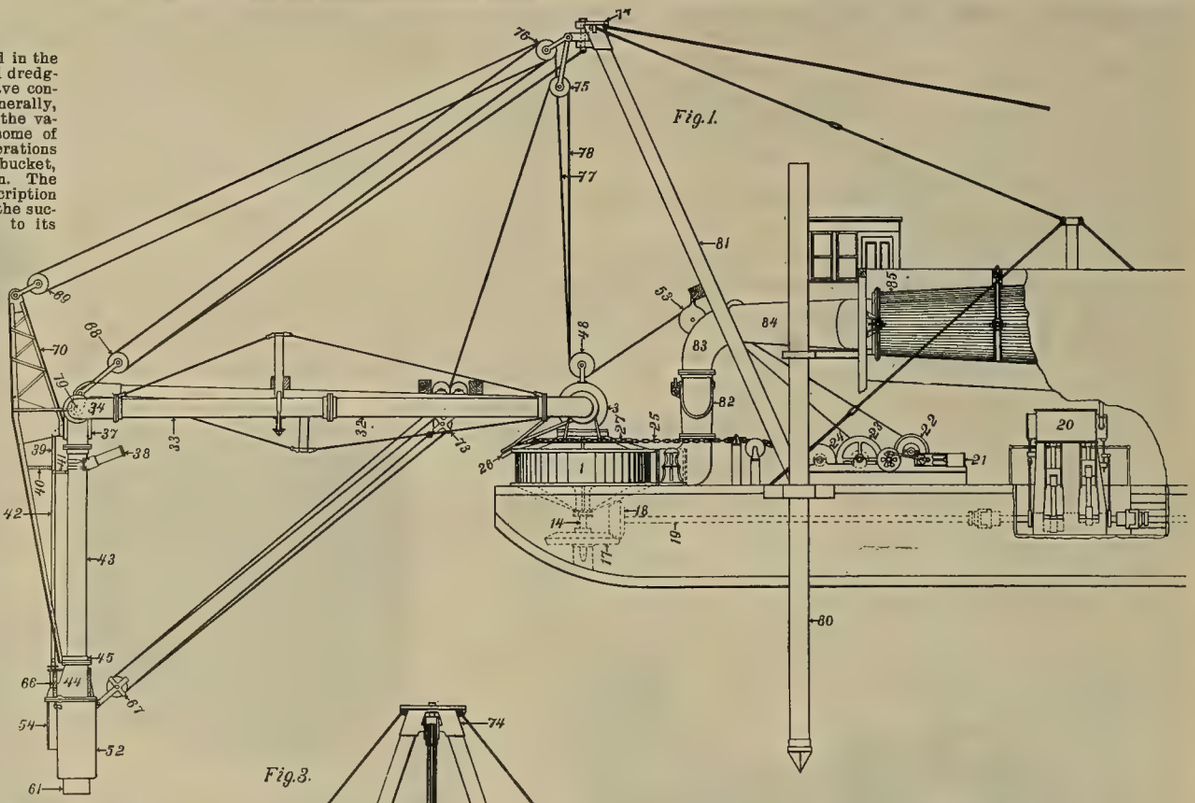


Fig. 1.

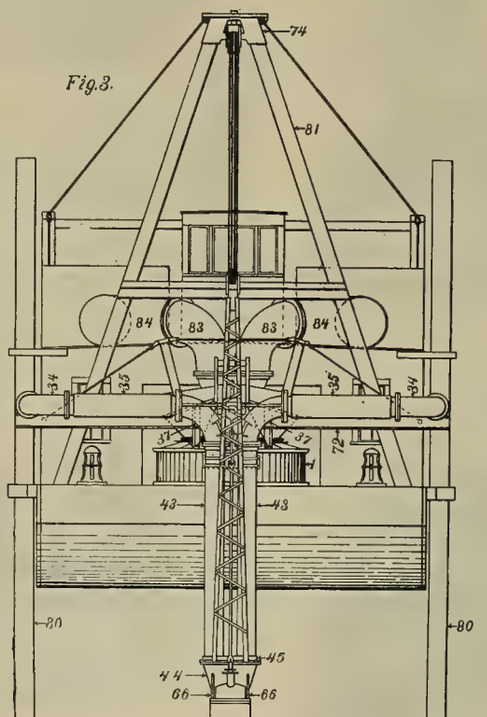

Fig. 3.

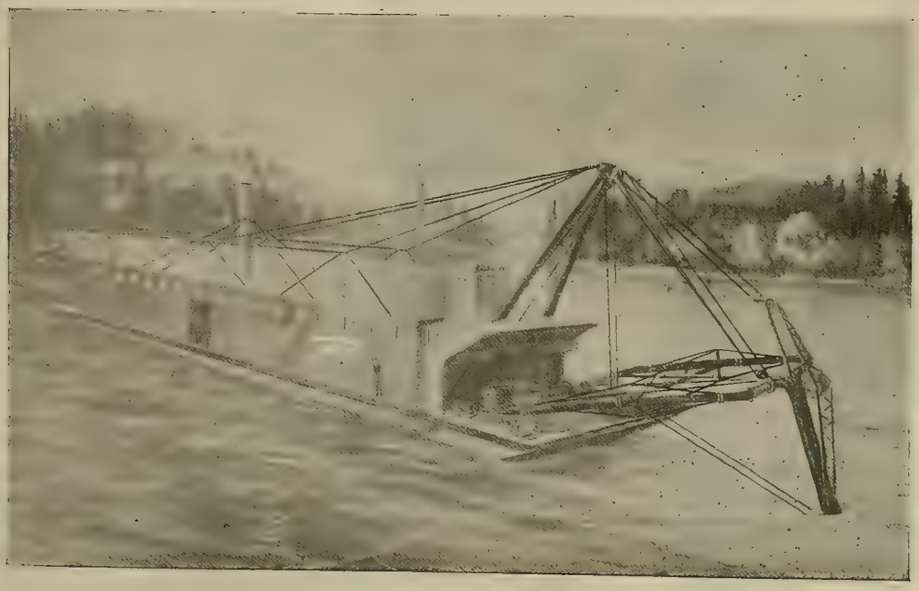

YOUNGS' GOLD DREDGE.

2. That it can move heavy boulders and take up the gold that so often fills the cavities around and under them. The boulders are nature's riffles and there the gold is found. 3. That it will handle 5000 or more yards per day, the capacity being an important factor. 4. That the suction is not hindered by clogging of the pipe, the rock ejector obviating that difficulty.

The following is a technical description of the pump and the operating machinery:

After five years of practical experimental work with our dredger, we have been able to ascertain more closely the changes necessary to be made to enable it to fully overcome the obstacles of nature, as well as others to be overcome, which have necessitated the making of some material changes—changes that are for the better, and which have not only lessened the weight of several parts, but strengthened and simplified the construction and reduced the cost of operation by increasing the capacity.

It was found that, in order to allow the suction pipe to reach the bedrock in deep gravel, a large percentage of the deposit had to be removed, and to do this a larger suction pipe had to be used, which of course necessitated the use of a larger pump. With the improvements made, the Youngs' Gold Dredger is completed and perfected to work under all conditions.

Referring to the general drawings (Fig. 1), note that the centrifugal pump is laid flat on the deck, at the bow of the boat. The shaft being vertical, is to be driven by bevel gearing from an engine placed aft; the suction is divided into two branches extending from opposite sides of the ball-shaped swivel tee on top of the pump. Short lengths of 18-inch O. D. wrought-iron pipe extend from each side of the ball "tee" to the water-sealed swivel flange. From each of the swivel flanges extends a short length (about 4 feet) of 17-inch suction hose, to the end of which is attached a cast steel elbow. From these elbows, pipes (18-inch O. D. wrought iron) lead forward 34 feet to similar elbows, to which are attached two pieces of suction hose, 7 feet long, ending in swivel joints, which are fastened to two elbows placed back to back, one arm of each pointing downward. These elbows are fastened together and swing from the end of the double boom by a modified form of universal or gun ball joint, giving free motion to the swinging pipe in all directions. Two vertical (18-inch O. D.) pipes lead downward 17 feet from these elbows to the valve chest. From the lower side of the valve chest a single pipe 26 inches inside diameter extends downward about 6 feet; to this is attached the rock ejector and plow blade. In front of the last-mentioned elbow is placed the swinging lever; a small cylinder is placed just back of this lever so as to operate the relief valve and rock ejector. In the rock ejector, in addition to the cross bar, are placed twelve retreating "chuck jaws," which, when the rock ejector is closed, extend each 1 inch into the side of the mouth of the pipe. Rocks can only become jammed into the mouth of the pipe between the face of the "chuck jaws," the sides of the plow blade and the sides of the cross bar.

In the valve chamber, when the rock ejector is closed, the valve is up and closes the relief pipe extending from the forward side of the valve chamber downward to within 2½ feet of the end of the rock ejector. When it is desired to eject the obstruction at the mouth of the pipe, steam or air is turned into the cylinder above mentioned which pulls up on the valve stem. This first opens the relief valve port, allowing water to pass in the pump freely, thus avoiding all necessity of stopping the pump while ejecting the rocks. The valve then swings down, entirely closing the main pipe above the rock ejector. When the valve disc gets within two inches of being entirely

closed, it strikes the ends of the rock ejector rods, which are attached to the cross bar and outer sleeve of the mouthpiece, forcing them downward and thus allowing the "chuck jaws" to retreat into the walls of the sleeve. This will let go of any rock, no matter how hard it may be jammed in; and as the valve is closed, they will drop entirely clear of the pipe. Springs are used to return the rock ejector sleeve to place, when the valve is raised again. This rock ejector and pump are designed to allow rocks 12 inches in diameter to pass through; all gravel less than that size will go through. This means removes practically all of the material on bedrock in most gold-bearing streams, thus thinning out the bar so that the coarse material can be easily moved around, enabling the pipe to reach and clean the bedrock.

Attached to the valve chest cap (45—Fig. 1) and the elbows (37) is a lever (70), to the upper end of which is fastened the double block (69). The line (77) passes from the masthead through the blocks (68, 76 and 69) and down to the hoisting drum (22). By pulling on the line (77) the pipe is drawn up and outward, when it is let down to the bottom; then, by pulling on a similar tackle (78), which is fastened to the lower end of the suction pipe, the pipe is pulled towards the boat through the gravel, it being essential that the pump be started and primed before lowering the pipe into the gravel to prevent it from choking.

A circular piece of angle iron (27—Fig. 1) is attached to the ball tee (3), to which is fastened a chain (25), leading to the drum (24). By this means the suction pipe is rotated through an angle of 150 degrees. A thrust roller (26) is attached to the ball tee (3) and runs on the beveled edge of the top plate of the pump. This relieves the thrust of the suction pipes on the swivel flange.

The weight of the extended pipes is carried by the trussed beam (72), which is in turn supported by the double boom (71).

The pump is designed especially for handling large gravel. It is built entirely of cast steel, with the exception of the shell, which is sheet steel. It is fitted throughout with cast steel liners, which may be replaced with new ones when they become worn out.

For the purpose of regulating the volume of water for sluicing there is provided two separate acting centrifugal auxiliary pumps, 8 and 12-inch, by the action of which the sluices are furnished with a uniform volume of water.

There is no question that by powerful suction the streaks of pay material in the serrated rocky channels can be brought to the surface, which could be reached in no other way. This includes the fine gold as well as the coarse, which, when delivered upon the boat, can be subject to the best known methods of saving it.

PARAFFINE PAINT CO., 116 Battery Street, San Francisco.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark

Our German drawing instruments bear only the trade marks or

We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Paragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

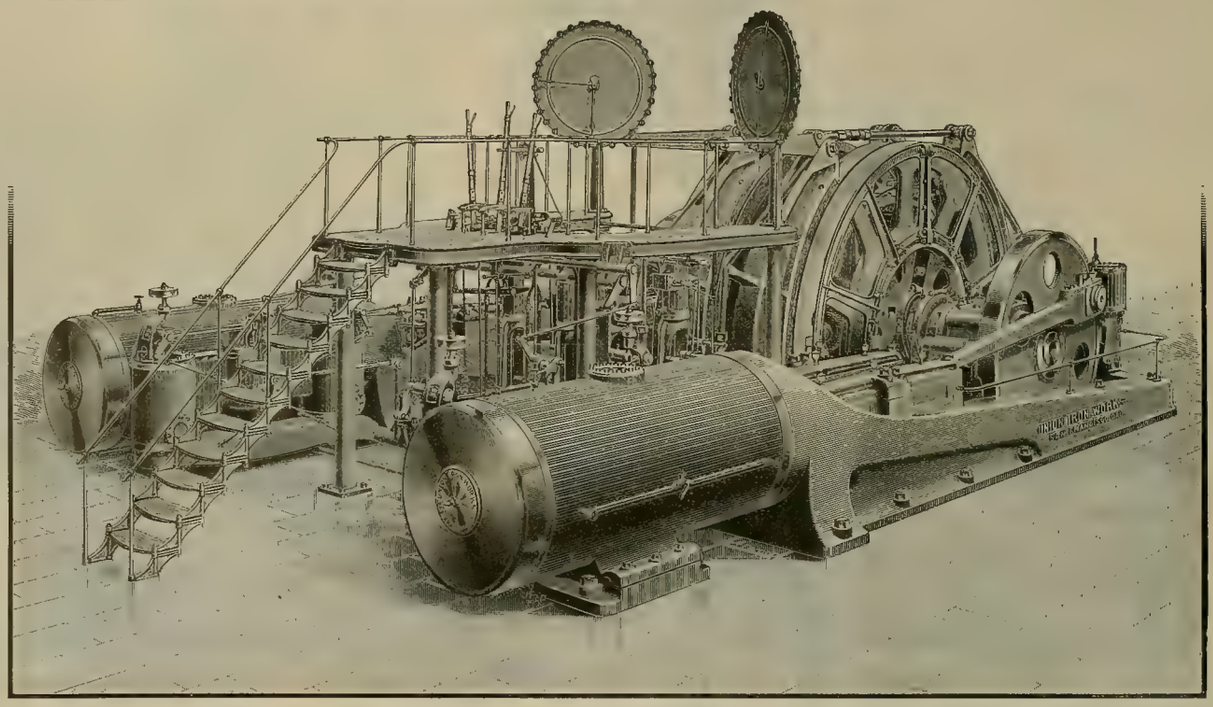
30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

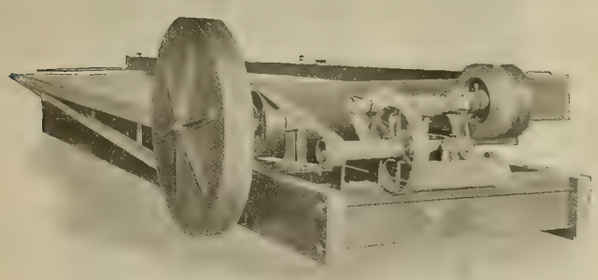
WHITE, ROGERS & CO.,

Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

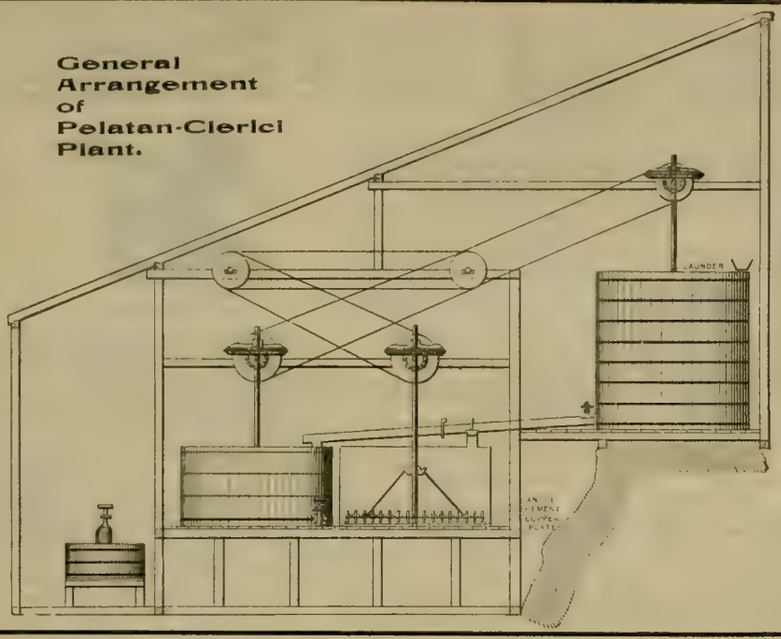
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves more than 85 per cent by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process. Cost of treatment is less. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge.

Simplicity. Economy. Efficiency.

PATENTS

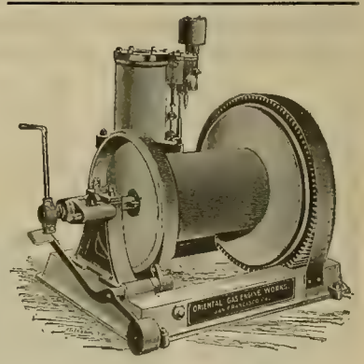
DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,

PATENT AGENTS,

330 Market Street, San Francisco, Cal.



This cut illustrates our 4 H. P. to 8 H. P. **HOISTING PLANT.**

Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake.

No better device has been designed for this purpose. For prices and further information address the builders.

Finds buyers or working capital for meritorious mines or good prospects. Correspondence invited. W. E. Holbrook, Pres't. L. F. Haskell, Sec'y. 29-30 Chronicle Building, S. F.

Assessment Notices.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business San Francisco, California, location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of December, 1898, an assessment (No. 32) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1899, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 23d day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Mills building, room 31, 10th floor, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of December, 1898, an assessment (No. 5) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of February, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, Cal.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1899, an assessment (No. 12) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, secretary.

Office 237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of January, 1899, an assessment (No. 20) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 21st day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of December, 1898, an assessment (No. 15) of ½ of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of January, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 2nd day of February, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—No. 1209 Claus Spreckels building, San Francisco, California.

ANNUAL MEETING.

Dutch Mining and Milling Company.

The Regular Annual Meeting of the Stockholders of the Dutch Mining and Milling Company will be held at the office of the company, No. 319 California St., City and County of San Francisco, State of California, on MONDAY, the 16th day of January, 1899, at the hour of 2 o'clock P. M. on said day, for the purpose of electing a Board of Directors for the ensuing year, and also for the transaction of such other business as may be brought before the meeting. Transfer books close Thursday, January 5th, 1899, at 3 o clock P. M. GEO. W. GERHARD, Secretary.

Dated San Francisco, December 31st, 1898.

ANTIMONY.

We buy Antimony Ore in any quantity and pay prompt CASH for same. Write us and let us know what you have.

DELINQUENT SALE NOTICE.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 22) levied on the 3rd day of December, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
H. F Anderson	93	3,000	$60 00
Calvert Meade, Trustee	196	200	4 00

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of December, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 106 Liedesdorff street, San Francisco, California, on MONDAY, the 30th day of January, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. CALVERT MEADE, Secretary.

Office — 106 Leidesdorff St., San Francisco, California.

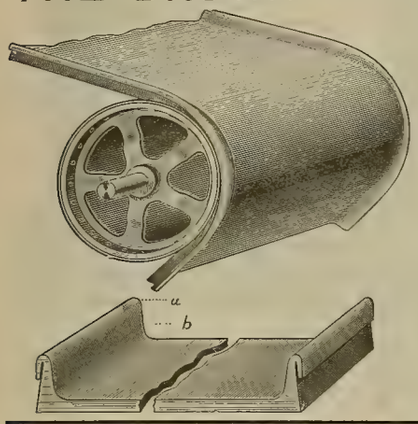
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

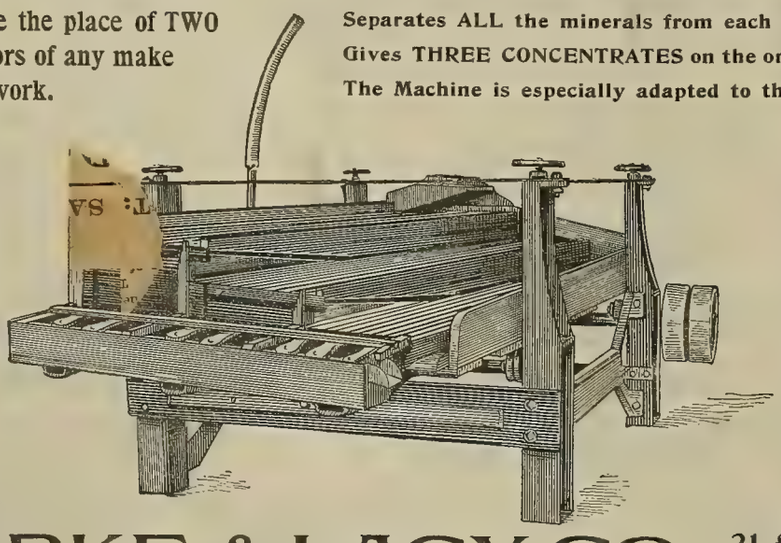
THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.

Separates ALL the minerals from each other at one operation.
Gives THREE CONCENTRATES on the one Machine at the same operation.
The Machine is especially adapted to the separation of Zinc and Lead.



SIZE OF MACHINE.....4 ft. by 8 ft.

WEIGHT.....1000 Lbs.

CAPACITY.....10 to 30 tons per 24 hours.

CAN BE SET UP ANYWHERE.

REQUIRES NO SPECIAL FOUNDATION.

THREE CLASSES OF MACHINES ARE MADE.

Table A is adapted to concentration from 2 into 1 to 8 into 1.
Table B, 6 into 1 to 16 into 1.
Table C, 12 into 1 to 32 into 1.

Parties desiring tests made can send 500 lbs or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed $10.00.

Price of the Table $300 Complete, f. o. b. Cars, San Francisco, Cal.

Licensee for the Manufacture and Sale, **PARKE & LACY CO.,** 21 & 23 FREMONT STREET, San Francisco, Cal.

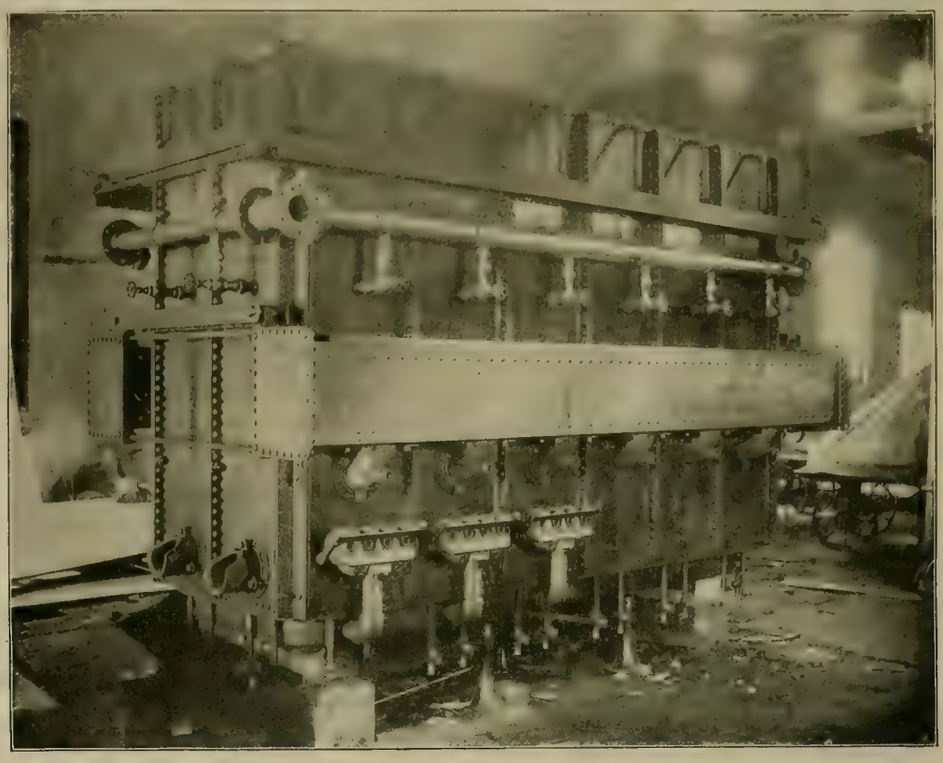
The Garretson Furnace.

The Garretson furnace, illustrated herewith, is intended for smelting and converting raw sulphide ores to metallic copper. The one depicted on this page has a stated capacity of 250 tons per day. The plan embraces a combination of pyritic smelting and continuous converting in a water-jacket furnace. It is a single-stack, arranged for two pressures of blast, intended to be so operated that copper bottoms or black copper may be tapped from one end, while more than ordinarily clean slag runs from the other end. This is in its simplest form. Constructed as a lead-copper smelter, with intent to treat complex ores, the plan includes primarily the reduction of lead, bismuth, etc., to a metallic state, they settling to the bottom and thence withdrawn, obviating loss by volatilization. A hot-blast is added when the furnace is built to operate as a pyritic smelter. The idea is one of economy of operation in carrying on in a single furnace the three operations of roasting, smelting and converting. The claim is made by the inventor that ores carrying sufficiently high percentages of sulphur, iron, arsenic, etc., can be smelted and converted into copper bottoms or black copper at one operation without the continued use of any carbonaceous fuel in the furnace. Bessemerizing low-grade matte ordinarily causes formation of slag on its surface. Securing its continuous flow and displacement by fresh matte arriving from the fusion of the ore is intended to overcome this difficulty: the corrosion and destruction of the quartz and clay converter linings by ferrous oxide formed is supposedly obviated by allowing the molten ore charge to directly rest upon the matte and slag bath



THE GARRETSON FURNACE.

surface. A saving of fuel by heat recovery from the slag is further claimed, and additional economy in mechanical handling of the slag. The accompanying illustration is of one built for the Compania Metallurgica Mexicana, San Luis Potosi, Mexico.

VIEWS OF THE BOILER EXPLOSION WRECK AT THE IONIA, MICH., INSANE ASYLUM.

Disastrous Boiler Explosion.

Herewith appear several views of a recent wreck caused by the explosion of a boiler in the power plant of the Ionia, Mich., State Insane Asylum, showing the ruin wrought in the boiler house and to the machinery. Strict investigation fails to determine the cause. A new boiler was being installed, was set, and the masons were bricking it up when the explosion occurred: two boilers were under steam, the one that exploded being that farthest from the new boiler. Three men were killed outright and several others injured.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Garretson Furnace; Views of the Boiler Explosion Wreck at the Ionia, Mich., Insane Asylum, 57. Marshall's Monument; Coloma from the Marshall Monument; Marshall's Cabin; Site of Marshall's Discovery; Mining Over Old Ground; American River at Coloma; Main Street, Coloma, 61. Double Drum Hoist and Electric Motor, 62. Latest Mining and Metallurgical Patents, 63.

EDITORIAL.—The Garretson Furnace; Disastrous Boiler Explosion 57. Coal on the Free List; Proposed Mining Legislation; The Same Spirit Still in Evidence; Case of the Keely Motor Co.; Increase in the Price of Copper; Electricity in Metallurgy; Unequaled by the Output of the Entire Nation; Mechanical Draught in Place of Chimney Draught; The Wilmerding School of Industrial Arts; Amendment to the State Law; Preparatory Hydraulic Work in British Columbia; Temperature of Battery Water; Increase in Electrical Machinery, 58.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 67–68–69.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 82.

MISCELLANEOUS.—Concentrates, 59. Mill Practice of the Utica Mills, Calaveras Co., Cal.; First Discoveries of Gold; Benefit for Users of the Telephone; New Steel Cars; Do Not Despise a Suggestion, 60. The "Copper Waters" of Butte; Double Drum Hoist and Electric Motor; Electrical Power from the Missouri River Dam; Cyanide and Comstock Tailings; California Miners Employed; Treatment of Battery Plates and Temperature of Battery Water, 62. Latest Mining and Metallurgical Patents; Seattle's Ship Canal; Telephones in Use in the World, 63. Electric Mine Signals; A Continuous Rivet Heating Furnace; A Borehole 300 M. Deep; Machines Designed for Lifting the Mine Cars in a German Mine; Silicification in Ore Deposits, 64. The Headwaters of the Lewis River; Reverberatory Furnace Smelting of Ores, 65. Some Experiences of a Working Miner; Forestry in California, 66 Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations, 69. Industrial Notes; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Commercial Paragraphs, 70.

PRESENT indications are that the Quebec Commission which is preparing a reciprocal trade treaty between the United States and the Dominion of Canada will place coal on the free list, but leave the United States import duty on lead and lead ore as it now stands, and all the Canadian papers sound the slogan, "Smelt Canadian lead ore in Canada."

AS THE several State Legislatures meet, proposed mining legislation is noticeable. Colorado, Montana and Washington have each a program, that of the two former being in line with progress and manifest requirements. What is proposed to be enacted in the Washington Legislature is mainly a reproduction of the Federal statutes thereon which do not need State affirmation. So far the California Legislature seems content with what it did in that line two years ago. It ought to be.

THE same indomitable spirit that in California changed the courses of rivers and overturned mountains is still in evidence. In Alaska, some California hydraulic miners have drained a lake 3000 feet long, 2000 feet wide and 150 feet deep—Gold lake, in Pande basin, near Sitka—in the belief that in its bottom would be found gold-bearing gravel. Six months of tunneling resulted in drawing off the waters of the lake last week, and the enterprising prospectors hope to recoup sufficient to pay for the effort and expense.

HOW CREDULITY sticks to its belief in a charlatan is exemplified in the case of the Keely Motor Co. While Keely lived it was of lesser wonder that his extraordinary personality should impress itself on stockholders in his company to the extent of securing subscriptions to enable him to experiment with his "motor" for twenty-five years and live comfortably. But with Keely dead it is surprising that a successor should arise and be sustained by men who in the past quarter of a century have contributed nearly $500,000 in perpetuating the folly known as the "Keely motor."

THE Standard oil people figure that an increase in the price of copper of one cent per pound equals an annual profit of $5,250,000, basing the calculation on the '97 copper output of the United States. They further figure that, by consolidation and control, a saving in production of one cent per pound could be effected, making another $5,250,000; and thus find warrant for the assumption that, by putting up $200,000,000 to enable their securing such consolidation and control, in addition to the present profit, they could assure an annual gain of $10,500,000, or, say, 5% on the amount named.

AS in other domains of science electricity is now greatly utilized in metallurgy. It is calculated that last year over one-third of the world's copper output was produced electrolytically; similar result is reported in the production of aluminum, and returns from the Pelatan-Clerici and similar processes show material advance in the electrolytic production of gold and silver. In addition is to be noted the more economical production of several other metals through the agency of electric action. It is now practicable to produce chemically pure chromium by ignition of a mixture of aluminum and chromic oxide; manganese, titanium, tungsten, etc., are susceptible of similar production.

FOR forty-five years the gold yield of California for one year—'53—has been unequaled by the aggregate gold output of the entire nation. In that year the lowest statistical figures place California's gold output for that year at $65,000,000; some as high as $80,000,000. Taking the former figures, the lowest estimate, as approximately correct, it appears from recently compiled statistics, that for the first time in the history of the nation the aggregate gold yield from all the States and Territories of the Union in '98 was some hundreds of thousands of dollars in excess of that of California for the year named. It would be of equal interest a year from now to note the probable fact that great though the '99 gold yield of the country will be, the value of the copper mined in the United States during the present year had exceeded that of the gold product during the same time.

MECHANICAL engineers look with favor on the proposed substitution of mechanical draught in place of chimney draught for furnaces. The former can be accomplished either by forcing the air into a closed ash pit and maintaining therein a pressure in excess of the atmosphere, or by exhausting the air and gases from the flue or uptake, thereby creating a partial vacuum, causing a constant onward air flow to the combustion chamber, the first method being a forced, the latter an induced draught, centrifugal fans being used in both cases. Two main advantages are claimed—independence of weather conditions and adaptability. Economically there is also something to be said in favor of the proposition, and from a health point of view—the suppression of smoke—the advantage is manifest. The chimney is an ancient device that in large plants to be built will begin to disappear.

IT is expected that the Wilmerding School of Industrial Arts will be in practical operation in San Francisco by Oct. 1st, '99. The creation of another school of technical instruction is of general industrial importance. It is to such schools that scientific progress largely looks for personal activity and practical requirements. Such trade schools are of an aim and intent equal to any institution designed to educate and should be accorded hearty support and recognition deserved alike from employer and employed. There is too often indifference on the part of the employer and latent or active hostility on the part of employes. This last mainly rises from a mistaken idea among trades which discourage apprentices, that in some way the graduates of such trade schools will come into competition with them. This is an old underlying question upon which pages might be written. Suffice it to say that the opposite is the case; that instead of inaugurating competition on the low level of "two men for one job," such schools are in the end creative of new conditions involving new requirements and increased demand for skilled labor. Boys and young men will drift in, if they are not steered in; better to have them enter the ranks of mechanical workers with skilled brains and a general ground plan of regular requirements than to enter the crowded ranks of bread winners with no training, little ambition and prospects dulled from the start. It is to the Wilmerding School and such institutions that the mechanical industries of this country should rightly look as they advance from the narrow past and face the broadening future.

IN the California Legislature now in session, a Los Angeles member has introduced an amendment to the State law approved March 27th, '97, prescribing the manner of locating mining claims, etc. The proposed amendment is an addition to the present law, as follows: "9. No person or persons who, after locating any mining claim under the provisions of this act or under the provisions of any statute of the United States, or who, having heretofore located such mining claim, shall fail to perform the labor required in this act or the labor required by the laws of the United States, and who shall permit the mining claim so located, to become subject to relocation, shall be allowed to relocate the same or to acquire any interest in or to any such claim by reason of the location thereof by another, and any relocation made by such person or persons, shall be void. Section 2. This act shall take effect and be in force from and after its passage."

BRITISH COLUMBIA papers very properly call attention to the large sums of money being spent in the Cariboo and other districts on preparatory hydraulic work, in some cases nearly $300,000 being put out in opening up and getting apparatus in shape for paying operations. The assertion, however, that such similar extensive preparations have never been equaled elsewhere, is open to successful contradiction. Everywhere that large areas of such ground are thus made ready, equal amounts are spent in preliminary work. In Idaho, Montana, Colorado and California such sums have been and are being expended. A notable instance in California is the Malakoff hydraulic property in Nevada Co., where nearly $3,000,000 was put out before the mine was on a permanently paying basis; it has since been credited with a gold output of nearly $5,000,000. So with other hydraulic mines. Such large preparations have become a necessary feature of the business. Time was when the individual miner, or two or three together, could start paying operations in a hydraulic mine on a prime expenditure of $500, but that era has passed. Those rich surface placers have been nearly worked out; and it now requires an aggregation of capital and the spending of large sums of money before there is any tangible result.

Temperature of Battery Water.

Considerable has lately been published in these columns on this important point, from practical millmen. On this subject, one whom this paper considers as authority writes us as follows:

"The main points to be remembered in this matter are that there is a point of temperature (4° Centigrade) at which water is densest and that there are temperatures at which mercury becomes sluggish in cold water. If these two points are avoided there is no particular definite degree of temperature which might be designated as absolutely the best. If the water is held warm the mercury becomes thus liquid and will coat a larger area of gold particles than in its more sluggish condition, hence under such circumstances it becomes necessary to reduce correspondingly the quicksilver feed to the battery. In cleaning up, the amalgam obtained from very fluid mercury will be naturally found to retort better, that is, higher. From actual working I have seen amalgam that retorted up to one-third gold change during winter months to one-fifth, but regain the higher percentage upon the occurrence of warm weather; in both cases the balls of amalgam were squeezed by the same operator to the same relative degree of dryness."

CHICAGO reports an increase of 15 per cent in the tonnage of electrical machinery handled there in 1898 as compared with 1897. Sales and repairs during the year amounted to $15,000,000. The great specialties are batteries, dynamos, motors, telephones, wires, telegraph instruments, etc., but the catalogues contain lists of about 3000 articles, large and small. As electricity grows in application, this list multiplies with the growth.

Concentrates.

IN '98 Utah produced 112 tons lithographic limestone.

WATER freely falling 196 feet acquires a velocity of 112.35 feet.

A MINERS' INCH will in twenty-four hours discharge 2160 cubic feet.

NEVADA got thirteen medals for exhibits at the Omaha Exposition.

THE largest zinc manufactory in the world is at Hazard, Carbon Co., Pa.

A FLOW of 1 cubic foot of water per second equals 50 inches under 4-inch pressure.

THE Australian mints that have been coining gold at a loss will now be permitted to coin silver at a profit.

MINING machinery may be exhibited at the London Mining Exhibition, but "mining products" are excluded.

TO ARGUE an axiom is a waste of time and space. The process must be suited to the ore—not the ore to the process.

C. POULOT of the Wood mine, Gilpin Co., Colo., says he will "send a 700-pound block of uranium to the Paris exhibition."

A TUBE or pipe 3 inches in diameter, 8 inches long, 5 feet head of water in the center, will discharge .718 cubic feet of water per second.

BY weight, dry atmospheric air is composed of: nitrogen, 75.5%; oxygen, 23.2%; argon, 1.3%; by volume, 78.06, 21. and 0.94%, respectively.

THE Omaha Exposition directors awarded the medal "for the best display of free gold in quartz" to the Smuggler-Union M. Co., Telluride, Colo.

AT the Silver Lake mine, Silverton, Colo., E. G. Stolber has four electric rock drills in successful operation. With ⅞-inch steel an average boring of 7 feet per hour is made.

AS long ago as '57 iron pipe 40 inches in diameter was laid for hydraulicking at Timbuctoo, Yuba Co., Cal. Recently, near Boise, Idaho, 48-inch pipe 1700 feet in length was laid.

THERE is practically nothing doing at present in mining chrome iron ore in California. Good ore exists in several parts of the State, but foreign importation makes the price unprofitable.

A BILL has been introduced in the U. S. Senate giving the right to take up and patent saline and soda lands under placer land laws. It limits holdings to 160 acres, and sets the price at $1.25 per acre.

THE inspector of explosives for Great Britain states with positiveness that "acetylene gas is capable of forming an explosive compound when brought in contact with copper." Nickel-plated brass is probably safe.

SILVER is now being exported to Europe from N. Y. City at the rate of 500,000 oz. weekly; gold is being imported from Australia to San Francisco at the average rate of $2,500,000 per each steamship arriving therefrom.

IN '98 Colorado mining corporations paid dividends aggregating $22,467,828. It is noticeable that that amount approximates that State's gold yield for the year. In the figures are not included mines of private ownership.

THE act making it mandatory in California for a second shaft on a quartz mine where exists a perpendicular shaft or incline 300 feet in depth from the surface, passed the Legislature March 16th, '72. It has not been repealed.

DEPUTY MINING INSPECTOR HUNTER of Montana says that there are 3336 men employed in and about the Anaconda mines, 864 in the mines of the Boston & Montana Co., and 549 men in the mines of the Butte & Boston Co.

THE war with Spain unfavorably affected gold mining investments; recent action, however, more than makes up for the temporary diversion of capital from what continues to be in general the most profitable present form of business enterprise.

IT is suggested in Los Angeles that a Southern California Miners' Association be formed, the point being made that at the meetings in San Francisco of the California State Miners' Association that section of the State was entirely unrepresented.

WITH from 10 to 25 feet of snow in the high Sierras, rivers running bank full in the valleys and a general continuation of heavy, soaking rain all over the State, California miners feel that the season of '99 will be in marked contrast to the dry one of '98.

A BILL has been introduced in the California State Senate to prevent the throwing open of ground for relocation when the assessment work has been done, but the necessary affidavit has not been filed. It should get no further than the committee room.

ALL the required apparatus for the Comstock, Nev., drainage, including the Evans pump and the big pipe, is on the ground, and the pipe is being placed in the C. & C. shaft. It is expected that in ten days water will be flowing through the Sutro tunnel.

THE California Anti-Debris Association having failed to institute a quarrel with the Almighty, has transferred effort in that direction in an attack on the California Debris Commission. It has also concluded to save $150 a month by doing without a manager.

THE Fresno Co., Cal., petroleum contains 48% kerosene, 20% gasoline, 10% heavy fuel oil, and 22% benzine and tar. So far efforts have been futile to successfully manufacture good illuminating oil from California petroleum, by reason of the very small percentage of paraffin it carries.

BRITISH COLUMBIA lead miners figure that during '98 they practically paid a duty of $33 per ton on the lead in the ores they exported to United States smelters, amounting to about $750,000. This 1½ cents per pound duty is remitted when the lead is re-exported from the United States.

REGARDING ilvaite, it may be further stated that it is a basic orthrosilicate of calcium and iron, in which manganese may replace part of the ferrous iron. It is iron black to dark grayish back, with a black streak inclined to green or brown; hardness, 5.5—6; specific gravity, 3.99—4.05.

THE California Legislature will be asked for a $100,000 appropriation to make a display of the State's mineral resources at the Paris Exposition. The bill provides for three commissioners to have charge of the exhibit, to be appointed by the Governor, to have no salary, but each one to be allowed $2500 for expenses.

A MULTITUDE of commendable mining editions of daily and weekly papers at the close of '98 has been received. Taking all things into consideration, it is believed that the Grass Valley, Cal., *Union* and the Telluride, Colo., *Journal* are entitled to special mention for their variety, value and typographical excellence.

ESTIMATING a consumption of 14 pounds of coal per square foot of grate per hour, about 8 pounds of water may be taken as the rate of evaporation per pound of coal, which can be done with natural draft. With forced draft and 28 pounds of coal per square foot of grate, the evaporation would be about 6 pounds of water to 1 of coal.

THE builders of the 328-mile long pipe line to Coolgardie Australia, propose providing for the five-eighths of an inch temperature expansion in 100 feet by a special expansion joint, formed by a double stuffing box with rubber rings, placed at intervals of 120 feet. Experienced engineers are dubious as to the success of the whole scheme.

CLARENCE KING places the average fineness of placer gold found in different localities as follows: Oregon, .872; Idaho, .780; South Dakota, .923; Montana, .895; California, .883; Colorado, .820. In specific cases much higher fineness has been noted, as in the case of a Cherokee Flat, Butte Co., Cal., correspondent who cites the production of gold there .970 fine.

THE U. S. gold imports for the year '98 were $158,036,252 and the exports $16,194,954, or an excess of gold imports in '98 of $141,841,298, as compared with an excess of gold exports in '97 of $255,309. The silver imports for the year '98 were $29,029,724 and the exports $53,797,104, an excess of silver exports of $24,767,380, as compared with an excess of silver exports in '97 of $25,578,990.

TO LIQUEFY air requires special apparatus, exact conditions and thorough knowledge of all attendant requirements. A pressure of about 200 pounds to the square inch, or nearly 150 "atmospheres" is necessary; the air so compressed must at the time of compression have a temperature of about 225° Fahr. below zero. The two requisite conditions are ordinarily impracticable.

"THE chief difference between an American miner and one of other nationality" is, perhaps, the versatility of the former. In other countries a man employed in or around a mine or mill does one thing and only one. In the United States he is liable to be everything at intervals, taking a hand at anything and everything in and around a mine, and sometimes acting as carpenter or cook.

EDUCATION by correspondence is widely advertised at present. An appreciative correspondent at Seattle, Wash., who has asked and had answered several questions on this page, says that "Concentrates" is a pretty good "education by correspondence" itself. Several hundred questions on every conceivable subject connected with science, mining, metallurgy, electricity, etc., are annually satisfactorily answered by this paper.

THE latest official report on New Zealand gold dredging gives the weekly cost of operation of one elevating and washing 90 cubic yards gravel per hour as sixteen tons lignite at $3, five men at $3 per day, and one man at $5, and "repairs and official expenses" $100, aggregating $248. The last item seems disproportionately large. Working ground containing 1⅓ grains of gold to the cubic yard, such a concern paid in dividends $5625 in '96 and $9375 in '97.

AT smelting works where metallic copper alone is treated, the refining slags must also be reduced by means of a blast furnace. The following may be given as one of the smelting mixtures: Refinery slag, 500 pounds; coke, 300; carbonate of lime, 500; dump slag (high in iron), 100; cobbings (material from furnace repairing), 100; refinery slag, 500; coke, 500. The resulting products from this smelting are a black copper, some matte, and a clean slag which is discarded.

THE Apollo mine is on one of the Shumagin islands, Unga, in the North Pacific, near Delarof, Alaska. It is remarkable in its situation. Considerable of its value is from "kidneys" of free gold ore. Galena is mined with the gold, and in some instances tiny shreds of native copper are embedded with the specks of gold in the quartz. The average gold yield is $8 per ton, about 80% coming off the plates. In some of the mine's features it resembles the deposits of Bodie, Cal.

ONE series of superimposed flows of lava on the western slopes of the Sierra Nevadas extends southwesterly from the summits on the California eastern boundary line sixty miles to Knights, following in a general direction the present course of the Stanislaus river. This lava flow poured out after a geologic interval of sharp erosion, which cut out the channel down which it flowed. It was subsequently partially covered by a flow of andesitic breccia above the foothills.

THE temperature surrounding electrical apparatus should never go above 212° F. As that of engine-rooms sometimes reaches 130° F., this means a limit of 82° F., or 45° C. above the air. But when this is taken with thermometer, the rise indicated by it should be much less. With the introduction of high-speed rotary engines, one may expect to see much higher field strengths, hotter armatures and different insulations, say armatures with copper bars enameled in the iron sheets.

IN a modified way the same advice may be of value to the man looking toward the Klondike in '99 that was offered in '98 and all the preceding ten years by this paper. Conditions of transportation and living are bettered, but unless fitted in every way for the adventure and prepared to spend two years there, no one should entertain serious thought of the trip. The possibility of quick returns is the sole incentive, and against such desperate risk the miner going to the Yukon region wagers life itself.

WHILE the cost of the new explosive, liquid air, is comparatively light, being merely the cost of liquefying the air, yet its general use will depend upon the removal of some of the present dangers accompanying its manufacture. So far as known its only practical test as an explosive has been made in a coal mine near Munich—reported to be a success. One thing will commend it to some miners—after a short time it ceases to be explosive, so that there is no danger of its hanging fire or going off unexpectedly.

THE price of 16 candle-power incandescent lamps in '82 was about $1; at present it is about 18 cents. The best lamps at that time, under laboratory conditions, gave about 0.28 mean horizontal normal candle-power per watt, and under commercial conditions about 0.20. The highest pressure for which they could then be obtained was about 110 volts. At the present time, under commercial conditions, the average lamp normally develops about 0.25 candle per watt. They can also be obtained, at 0.25 candle per watt, for pressure up to 240 volts, and are frequently installed on 220-volt mains.

THE largest known deposit of manganese ore is in Chiauturi, Kutais, in the Caucasus mountains, furnishing about one-half the world's supply of manganese ore, which carries from 40 to 60% of the metal. About 2700 men are employed at a daily average wage of forty cents. The workings are of a primitive and wasteful character. The total cost at the mine is about 95 cents per ton. Transportation, loading, storage, insurance, duty, etc., bring the cost delivered at English ports, c. i. f., up to $9.40 per ton. As in California, "overproduction" is locally asserted to make the business profitless to the producer.

THE *Mountain Echo*, published at Angel's Camp, Calaveras Co., Cal., in its issue of the 10th inst., notes the case of a mine owner in Nevada county justly convicted of perjury for falsely swearing to an affidavit of labor. He swore that he performed labor during the year 1898 upon his placer claim to the fair and reasonable valuation of $100, and in September, 1898, filed his affidavit. It was proven at the trial that he had only sunk a hole 15 feet in depth by 3½ feet in diameter, the same being in loose gravel. It was also proven that the labor performed could be done in three to four days at a cost not exceeding $24, hence the conviction.

ACETIC ACID, like other chemicals, is governed in price by quality, even more than quantity. "Acetic acid" is quoted this week in New York City at $1.87 per 100 pounds; "acetic acid" is also quoted this week in New York City at $22.50 per 100 pounds. The former is "28% commercial;" the latter is "Glacial, 99.5%." If the purchaser wants it in quantity he can buy say a 50% acid in New York City for $3 per carboy in five-carboy lots. A 90-pound carboy mixed with 90 pounds of water will make 180 pounds 25% acid, thus saving the freight from New York to Denver on 90 pounds water and the carboy. The latter are returnable at $1.50 each.

IF, as alleged, last week's action of the British Columbia Parliament, excluding citizens of the United States from holding mining claims in that province, be one of "retaliation," the act is ill-founded. On March 2nd, '97, the Congress of the United States passed an act, immediately signed, which defined and regulated the rights of aliens regarding real estate, in which was clearly stated: "This act shall not be construed to prevent any persons not citizens of the United States from acquiring or holding lots or parcels of land in any incorporated or platted city, town or village, *or in any mine or mining claim*, in any of the Territories of the United States." A little "reciprocity" is in order.

EDMUND DAVY first made acetylene from a compound produced during the manufacture of potassium from potassic tartrate and charcoal, which, under certain circumstances yielded a black compound decomposable by water with considerable violence and the evolution of acetylene gas. This compound was afterward investigated by Berzelius, who showed it to be carbide of potassium, and who also made the corresponding sodium compound, and showed that it evolved the same gas; in 1862 Woehler first made carbide of calcium, and found that water decomposed it into lime and acetylene. The present process of producing calcic carbide is the discovery of Mr. Wilson, a Canadian.

REGARDING the article concerning the use of running water in California and how to appropriate it, on page 631 of the issue of Dec. 24, '98, it is to be noted as stated that the mere posting and recording of a claim to water confers no right upon the appropriator unless, within sixty days after the notice is posted, the construction of works is begun and diligently prosecuted to completion. In that event (and only in that event) rights are acquired, which then date back to the time the notice was posted. Moreover, the water right secured under the notice and by construction of works should not be considered to be that defined in the notice, wherein the amount named is often greatly exaggerated, or, possibly, unintelligible. Regard is to be had to the works and their capacity as actually constructed in interpreting the language of the claim.

THE Mond process for extracting nickel depends on the property of finely-divided nickel of forming a volatile compound with carbon-monoxide, from which metallic nickel may be released by heating to 180° C. Prof. Austen describes the process and an experimental plant at Smethwick, near Birmingham, where about eighty tons of nickel have now been extracted with satisfactory results. The matte is first roasted, after which it contains about 35 per cent of nickel, 42 of copper and a little iron. About two-fifths of the copper is then extracted by sulphuric acid, the remaining copper is reduced to the metallic state by the hydrogen in water-gas, and the nickel taken off by carbon-monoxide in a volatilizer. The ore circulates between the reducer and volatilizer for seven to fifteen days, the residue of about one-third, not much changed from the original composition, then going back to the first operation. The nickel carbonyl from the volatilizer is decomposed in a retort, the resulting metal containing 99.8 per cent of nickel, the gas being collected for use again.

AS TO the sometimes stated electrical theory or conclusion that virtually the only function of a wire is to dissipate energy, Fessenden says: "The dissipation of energy is merely an incident and has nothing to do with the function of a wire, which is to carry what we call the quantity of electricity. Take for instance a copper wire at absolute zero. It then dissipates no energy, but does any one suppose that we could then remove the wire and still have a current? Not unless the ether at absolute zero were a conductor, which is negatived by the fact that the sun's light traverses space, which it could not do if the ether in space were not a perfect insulator. A sensational idea, even in science, is hard to kill, no matter how false; as witness, the often repeated statement that light is due to charges oscillating on the atoms, as in small condensers, though this statement has been refuted time and again, and by the very man who first made it. And so we must be prepared for some years to hear that the ether is the all important thing, whereas, as a matter of fact, it is merely the thing which pushes along the thing which we call the current. Now we know three ways of producing a current: convection, electrolytic conduction and metallic conduction. We know that in convection the current does not travel with the velocity of light, but that, by putting charged balls in the insulated buckets of a coal conveyor, we may have any current we please, and the electricity traveling as fast or as slow as we please. In electrolytic conduction we have very good reason to believe that the electricity travels on the atoms, and at a speed of only a few centimeters per second. Having thus one instance in which the current is known not to travel with the speed of light, and one in which it is almost certainly known not to do so, does not the burden of proof that the current in a wire does not flow also at some slower rate fall upon these all-ether physicists?"

Mill Practice of the Utica Mills, Calaveras County, Cal.*

NUMBER III.—CONCLUDED.

By W. J. LORING, Angels Camp, Cal.

When the battery is first hung up the little spreader plates are taken to the cleanup room and cleaned, and the amalgam obtained from these plates is dropped into the tank, which, after the cleanup, is cleaned out, the product being charged into the amalgamating barrel.

After the mill has been thoroughly cleaned up in this manner, 150 pounds of quicksilver is put into the barrel with water enough to give a depth of 12 inches over the charge of sand. The barrel is then closed, locked and sealed, and the belt is put on, which drives the barrel at fourteen revolutions per minute. This charge is run from thirty to forty-eight hours.

This amalgamating barrel has a tank of equal capacity built under it, whence a sluice 22 feet long and 12 inches wide, with a grade of 1½ inches to the foot, floored with silvered copper plates, conveys the pulp and water to either of two settling tanks, as desired. When the barrel has run its full time it is stopped with the head up, and after the head has been removed a stream of clear water under high pressure is turned on, causing the slimes to come to the top of the barrel, overflow, and fall into the tank beneath. Hence they pass through the sluice into a large tank of 2000 gallons capacity. When all the slime has been washed out the water is stopped, a bucket is set under the 1¾-inch plug hole in the barrel, and the charge is drawn. First comes the quicksilver, which, of course, falls to the bottom of the bucket. A stream of water is kept running through the barrel to wash the sand through the discharging hole, and the bucket is thoroughly stirred, so that the sand will overflow, leaving the amalgam in the bottom, the "iron" next, and the sand on top. This "iron" is taken out as it accumulates, and after it has all been collected it is screened through a ¼-inch screen; the screenings are panned in the cleanup tank, and the result is put back into the amalgamating barrel at the next regular cleanup.

The amalgam from the barrel is thoroughly cleaned and squeezed through white drillings. The amalgam balls weigh from eight to twelve pounds, and yield, when retorted, about 38 per cent of gold.

The day before the batteries are to be cleaned the accumulations on the sluice plates are scraped off with steel scrapers, made of old files turned at one end about 2 inches, and ground to a sharp edge. The first 8 feet is scraped in this way, leaving the 14 feet of silver plates to run six months or more without scraping. Great care must be observed in using scrapers on silvered plates, as it takes but little scraping to cut the silver, which not only spoils the plates but makes a very low grade of bullion—a result to be avoided if practicable. The amalgam thus collected is called "accumulations." It is put in a small amalgamating barrel 15 inches in diameter and 24 inches long, which is run at twenty-eight revolutions per minute, some quicksilver being added, and enough water to make a thin paste of the charge. The barrel is then sealed up and locked by means of a padlock securing an iron bar which, being itself held firmly by iron lugs on the barrel, covers and completely protects a cap, placed over the discharge plug.

This charge is run for twenty-four hours, when it is drawn off in a bucket and cleaned in the usual way, the sulphurets being saved in the cleaning tank already described. This amalgam yields, when retorted, from 28 to 30 per cent of gold.

Quicksilver is fed into each battery every hour. The amount of each feed is regulated according to the quality of the ore under treatment, which is judged by the amalgamator from an examination of the board directly under the splash of the battery, where the pulp first falls from the screen. Different ores and different mills require, of course, different practice in this detail of amalgamation.

Every ounce of quicksilver that is fed into the battery is weighed and recorded at the end of each shift, and at the end of the run the amount of the quicksilver thus fed furnished a practical basis for calculating the probable result of the cleanup before it is made. My own method of making such a preliminary estimate is as follows: Take the total amount of quicksilver fed during the run, and assume a product of $14 to $15 per ounce, and add to this the amount of the "accumulations" mentioned above, assuming a value of $70 gold per pound of accumulations. The total will be very nearly the yield of the cleanup. Of course, these figures would not hold good for all kinds of ore; but if a millman is careful he can soon find out, by observation and a few tests, what grade of amalgam he is producing; and the above method, with the employment of figures based on local experience, will be found useful in judging of the probable result before the cleanup is finished, and in detecting abnormal final results which call for investigation.

At many places retorts are lined with chalk, clay, etc. My way is to take good oak ashes, free from dirt; sift them through a 30-mesh screen; make a paste with water, and with this paste line the trays and retort, and thickly seal the head. The ashes do not shrink, like clay, etc., and the method, which I have practised for many years, is quick, cheap and satisfactory.

The mortars in the mill on which this paper is based are not lined—in fact, were not made for lining. After using them for several years, it was found necessary to do something very quickly, as each end was worn, just above the dies, to ⅝-inch in thickness, which, of course, would not stand a great while. These stamps were set 10 inches between centers, using 8½-inch shoes, and leaving a space of 1½ inches between each two shoes. The 5-inch dies up to that time had an average life of fifty-nine days, the life of the chrome steel shoes then used being 191 days. The average number of stamps running per day for 333 days in 1896 was fifty-seven out of sixty, and they crushed 273 tons per day.

In order to line these mortars I found it necessary to reset the stamps, using a guide with 9¾ inches between centers, and leaving ¾-inch between stamps. In this way 1½ inches was gained at each end of the motars, allowing room for an end liner, which served as key to the front and back liners. The back was filled with wood carefully fitted in place with the liner outside, saving considerable weight of unnecessary iron. This back lining is 13 inches high and stands at 77½°, the foot being 1½ inches from the base of the die, which causes the rock, as it is fed into the mortar, to fall on the die. These dies are made with 8¾-inch face, while the shoes have but 8½ inches. This I have found to give better results than when both shoe and die are of the same diameter, for the reason that the stem guides are bound to wear, allowing the stamp to swing much more at the shoe, causing the shoe to overhang the die. Now, by having the die cast ¼-inch larger than the face of the shoe, we utilize the full brushing surface of the stamp.

On the other hand, if the shoe and die have a greater difference in diameter, the one having the larger diameter will "cup" in wearing, causing a loss in efficiency.

After making the above changes, the mill ran 320 days; average number of stamps per day, fifty-nine; average number of tons crushed per day, 296; average life of 5-inch cast iron dies, 120 days; average life of manganese steel shoes, 296 days.

The chuck blocks are made of wood, covered with copper ⅛ inch thick and 8 inches wide, and as long as the battery. In the center of the copper, for the full length, it is bent to fit the wooden block, the upper half being set at an angle of 45°, while the lower half stands vertically. At the lower edge of block, and projecting ¼-inch over the copper, is bolted a ½x1-inch iron strap for the full length of the copper. At the bend in the copper, or about 2 inches above the bottom iron, is bolted a second iron strap, ½x¾-inch, for the full length. Six bolts are used, passing through the block and copper, ⅝x5 inches in size, with countersunk heads. These irons also act as a protection for the amalgam, as it "builds" between them.

I use eight and one-half gallons of water per battery of five stamps per minute, and two and one-quarter gallons of water per minute on two concentrators, making ten and three-quarters gallons per minute for each battery complete.

The chips and all shoe wedges—in fact all the wood used about the mill—are saved and burned in a 5x8 foot furnace built for the purpose. This furnace has a cement floor, above which are placed grate bars to the full size of the furnace. The furnace measures, from cement floor to top of bars, 15 inches; from top of bars to top of arch, 5 feet. At the top of the furnace is the charging hopper, made of cast iron, with a door to fit. After a charge is burned the ashes are taken out from the ash box and screened, to remove old nails, etc., that may be in the charge. The ashes are then put in the large amalgamating barrel with ten pounds of quicksilver and ground for six hours sharp, as a longer time would cause the charge to "flour," causing a loss. From six ounces to two pounds of amalgam is saved by this method every month.

The floors all have a slight grade, at the foot of which is a trough leading to tanks which are cleaned out as required, the result being put into the barrel. All cleanings from the mill are put in this barrel and ground for such time as the case may be. It is surprising how much gold can be thus saved in a year by watching the little bits that do not seem to amount to much. Many thousands of dollars are saved around a large plant by such minute care.

For grinding the amalgam recovered from the chuck blocks I have an iron mortar 12 inches in diameter, the muller of which has a connection made in such a way that it can be stopped or lifted as desired. This grinding machine will grind a charge weighing fourteen pounds. It has a speed of sixty-five revolutions per minute.

The labor in the mill is as follows:

One man on each shift of twelve hours, called the feeder, who does nothing but look after the feeding of the batteries.

One night amalgamator, who attends to the amalgamating and looks after the mill generally.

One concentrator man on each shift of twelve hours, attending to thirty-six concentrators.

One day amalgamator and helper, who attends to the amalgamating and general repairs about the mill.

One mill superintendent who has charge of everything in connection with these stamp mills and of the electro-plating works where the plates for the mills are silvered; his time being divided among the mills as required.

Seven men besides the superintendent operate the 60-stamp mill.

The cost of ore milled in 1897, exclusive of power, was 13.8 cents per ton. It is not practicable to give exact cost of power; but it is, of course, very small, as the water supply is owned by the company.

The consumption of quicksilver for the same period was 0.076 ounces per ton of ore treated.

* Trans. Am. Inst. Min. Engs., Buffalo meeting, October, 1898.

First Discoveries of Gold.

It is just forty years since the first discovery of gold in the State of Colorado. At what is now known as Idaho Springs, then known as Jackson's Bar, Geo. A. Jackson made the first discovery of gold in the mountains on that side of the continental divide, Jan. 21st, '59—forty years ago to-day. Some time since the spot and adjacent ground was acquired for the purpose of erecting a commemorative monument thereon. Doubtless the three counties of Boulder, Gilpin and Clear Creek, and, probably, all Colorado, will appropriately celebrate the dedication of the proposed monument at no distant date. Jackson's was the initial discovery, and soon led to several others, notably that of Thos. Gregory, on the north fork of Clear creek, on the present site of Black Hawk and Central.

The importance of the event to Colorado and the West is too manifest to need a line of comment.

By a singular coincidence this date, Jan. 21st, is also the anniversary of the demonstration of the fact of Marshall's discovery of gold at Coloma, Cal., eleven years before the Colorado gold discovery. A year ago, with great ceremony, California enthusiastically celebrated the fiftieth anniversary of that great event.

Jackson's Bar, where the Colorado pioneer gold discoverer made his first find, is still worked and still yields a little gold. It is different in the case of the California gold discovery, the site of which now contains nothing that would indicate that the little nugget there found started the great human tide that, rolling over the Sierras, has resulted in a gold output aggregating in value $1,300,000,000. Indeed, the scene of the first great California gold find is now devoted to wine and fruit. On the opposite page appear seven views graphically portraying the present appearance of that famous spot. The little post and the pile of stones are all that indicate the site of the famous "Sutter's Mill," and the two boulders in the smaller picture are still shown as the exact spot where the mill dam stood. On the round-topped hill stands the monument to Marshall, and at its base is the old cabin where California's gold pioneer lived and died. The town itself, embowered in trees and clustering vines, gives little indication of having been the initial point of one of the greatest events in modern history.

PROFESSOR LODGE has been experimenting with a view to conferring a benefit upon the users of the telephone, his object being to construct a telephone that will increase the human voice on the instrument to a bellow, while preserving articulation. The professor's aim is a telephone call for systems of so-called wireless telegraphy. The minute current of his receiver passes through a light, small coil attached to the disc of a microphone placed in a strong magnetic field. The coil sets the microphone in motion; the relay current of the microphone is thus interrupted: these currents pass through a second similar coil, and so on. By using four coils a feeble sound may be magnified to the intensity of the human voice, but not more. It is said that similar experiments with coils consisting of one wire only have been made.

AN engineer, speaking of the new steel cars, said: "Those big steel cars are terrible in a collision. You see, they are so solid and heavy that it takes an immense force to lift them from the rails, and they cannot be demolished, and when a collision occurs the locomotives are crushed like an egg shell. You might as well run into a stone wall as to pitch into a train of steel cars. When we find that a collision is inevitable we jump the nearest fence and take to the fields for safety."

NEVER despise a suggestion. The most ignorant person in the world may have an idea that will benefit you in your business, if you will keep your ears open and listen. Absorb all the ideas you can—some day they may be useful.

The "Copper Water" of Butte.

Written for the MINING AND SCIENTIFIC PRESS by GEO. S. BINCKLEY.

One of the most serious and perplexing problems relating to mine drainage is encountered in places where the water is strongly acid and impregnated with metallic salts. The conditions named have existed for years at the Anaconda mines, and almost every conceivable means has been employed to overcome the corrosive action of the water on the pipes and pumps, the destruction being greatest where the velocity of the water is high, for instance, on the valve seats and faces.

Neutralization of lime, of the acid in the water, is resorted to in cases where the value of the metallic contents of the water is low, but in the Anaconda, St. Lawrence and High Ore mines there is so much copper carried in the water that, great as the expense of pumping is, it still pays to avoid neutralization, as almost all the copper in solution is recovered by passing the water through precipitation tanks containing old iron of every description, from tin cans to old boilers, cages, etc.

At these mines it was found long ago that iron column pipes, iron fittings and pump barrels would speedily be converted into a spongy mixture of copper and rust, so that brass fittings were used and the column pipe lined with sheet lead. This did pretty well until it was found that the vibrations of the column, due to the action of the pumps, soon shook loose the lead lining and the pipe would be immediately destroyed. Then, in order to support the lead, it was found necessary to line the pipe inside the lead with nicely-fitted wooden staves, which, when wet, would swell and hold the lead to the inside of the pipe. This is found fairly satisfactory, but, if the least leak exists in the lead lining, a small hole in the iron column pipe is an almost immediate result, and, if the leak is not stopped, the pipe is attacked on the outside by the water from the leak, causing great damage.

The next serious trouble was found in the brass fittings and pump barrels, plungers, etc. It was discovered that, if there was even a small proportion of zinc in the composition, the acid water would relentlessly hunt it out, and, from a sound casting, the piece would be converted into a weak, worthless sponge.

To meet this difficulty all pump barrels, plungers and fittings are made from a special bronze, containing no zinc at all—a very difficult metal, by the way, from which to secure sound castings.

After years of experiment and expense the problem of pumping has been pretty well solved, but outside the pumps and columns the destruction caused by this "copper water," as it is called in Butte, is very great. The destructive effect of this water on iron and steel reaches its most serious phase in its insidious attacks on the hoisting ropes, running in the wet shafts, which are constantly exposed to the action of the water, and the vapor, which is scarcely less acid than the water. The greatest care is exercised in the tarring and repairing of the rope, and there are always several extra ropes kept at each mine in order that ropes in action may be repaired or tarred the instant they show the effects of the water.

The cages suffer severely also, the water flowing over them eating away the iron in a surprisingly short time, and its intrusive effect is so great that it will eat in around a solidly driven rivet and loosen it until worthless. The bonnets, braces and guide shoes on the cage, are all heavily copperplated from the dripping of the water, and it is a constant menace to the security of the kingbolt, which is in a particularly exposed position. The landing dogs and station chairs soon present the appearance of charred sticks of wood, and are notched and seamed wherever the water drips on them—some fibers resisting better than others, with the result that solid wrought iron takes the appearance of weather-worn wood.

Another source of annoyance is the water that comes up on the ropes flying all over the engines, staining the bright work wherever it touches, and the fact that the ropes have to be kept freshly tarred makes it almost impossible to keep the engine rooms neat, for the tar flies as well as the water and keeps the wipers busy scraping it off—a difficult feat while the engines are running, as these do, for twenty-four hours a day.

The water is so full of acid that it speedily destroys the clothes of the men that work underground, rotting the cloth in a few weeks so as to be useless, and a drop of it in the eye is a serious matter, as it means pain and inflammation for hours and sometimes days; and if it is hot, as it often is, serious injury is likely to result.

It is fortunate that such difficulties are not often encountered, or the expense and trouble would prove to be the last straw to many a promising mine, struggling, as most such mines are, under a heavy load of preliminary expense. At the Anaconda mines, however, by means of the precipitation on iron of the copper contained in the water the scrap pile (always an eyesore) is rapidly reduced, and a handsome profit made over the total expense of pumping and maintenance of plant, so that the "copper water," although not an unmixed blessing, has its compensations in this case.

California Miners Employed.

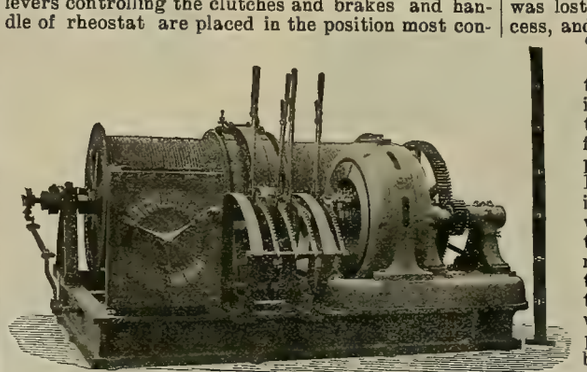
In answer to several inquiries as to the number of miners employed in California by counties, the following is subjoined. It was obtained through the courtesy of Mr. Yale, the statistician of the U. S. Mint at San Francisco, and is considered accurate. It will be noted the list includes only "gold and silver miners." In the case of Shasta Co. the production of gold and silver by the Mountain Mines Co. at Keswick, in addition to copper, has caused their being embraced in the list:

Counties—	*No. of Miners.*
Amador	1,085
Butte	653
Calaveras	1,064
Del Norte	46
El Dorado	943
Fresno	271
Humboldt	63
Inyo	258
Kern	960
Lassen	50
Los Angeles	74
Madera	138
Mariposa	853
Mono	214
Nevada	1,163
Placer	1,165
Plumas	440
Riverside	240
Sacramento	175
San Bernardino	472
San Diego	662
San Luis Obispo	14
Santa Barbara	12
Shasta	1,964
Sierra	574
Siskiyou	977
Stanislaus	20
Trinity	1,126
Tulare	30
Tuolumne	957
Yuba	130
Total	16,783

To the above is to be added a large number of men engaged in quicksilver mining, chrome, copper, salt, manganese, platinum, asphalt, bitumen rock, quarries, oil, clay, and other mineral productions. It is believed that were an approximately correct list secured of all the men now engaged in mining in California it would aggregate about 25,000, this being exclusive of office employes or any one indirectly connected therewith, but representing solely those employed in actual mine labor. Nor would it include the army of prospectors, who are always in advance of all the others.

Double Drum Hoist and Electric Motor.

The electric hoist illustrated on this page shows one of the recent applications of a General Electric induction motor to a double independent drum Lidgerwood mine hoist. It is compact in form, and the levers controlling the clutches and brakes and handle of rheostat are placed in the position most convenient for control by the operator standing on a platform above the floor, and having a clear view over the top of the hoist.



DOUBLE DRUM HOIST AND ELECTRIC MOTOR.

Each friction drum is driven through a single reduction gearing by a 100-volt 12-pole induction motor of 30 H. P. capacity running at 600 revolutions per minute. Each drum is independent and is 42 inches in diameter by 40 inches in face. Together they hold about 420 feet of ¾-inch rope. The maximum hoisting speed is 300 feet per minute and the weight hoisted—*i. e.*, load, car and and cage—2100 pounds. The depth from which the load is to be hoisted is 400 feet from the surface.

Of the 1,288,163 telephones in use in the world, over half, or 772,662, are operated in the United States, according to exhaustive statistics collected by the Swedish Government and reported to the State Department by Consul Winslow of Stockholm. Germany comes next with 151,101, Great Britain third with 69,645 and Sweden fourth with 56,500. In Cuba there are 1818, in the Philippines 452 and in Canada 33,500. Out of the total length of telephone lines of 1,509,499 miles the United States has 805,711 miles.

Treatment of Battery Plates and Temperature of Battery Water.

TO THE EDITOR:—It is pleasant to note the interest taken by mining men in matters connected with their vocation, even such details as the treatment of battery plates. It argues well for the industry. It seems to be agreed by all your correspondents that the final brushing of the plates should be crosswise—that is to say, at right angles with the course of the water as it flows down the plates. It is agreed that this brushing leaves the surface of the amalgam in a series of minute ridges and furrows. Now, if your millman will brush a portion, say, half, of a set of plates crosswise, and the balance lengthwise, that is, parallel with the running stream, then, if the battery should stop after running for a time, the water continuing to run down the plates until clear, he will observe that the surface brushed parallel with the flowing stream is clean and well adapted to the adhesion of the particles of gold passing out through the screen, while the portion brushed crosswise appears dirty and discolored, because the furrows are filled with minute particles of iron and sulphurets coming from the battery, and only the summits of the ridges are presented for the adhesion of the gold, and it will not appear clean until the surface is thoroughly gone over with the brush. Try it.

In regard to the temperature of the water, it occurs to me that sufficient account has not been taken of the increase of temperature of the water in the battery, owing to the concussion of the stamps; but probably more depends upon its quality than its temperature. I recall an instance where the battery water came from springs and a running stream, and the parts continued in good condition; but, the supply running short, the water from the mine was turned in, when the plates developed green streaks at once. Doubtless, water coming from a mine brings with it soluble portions of various minerals, though why these should specially attach themselves to a mercurial surface is not clear; but the purest water passing through a battery in operation might acquire some evil ingredient. N. B. WILLEY.

Blue Canyon, Cal., Jan. 12th, '99.

Cyanide and Comstock Tailings.

Chas. Butters of California, and more recently of South Africa, is having made some extensive tests of Comstock, Nevada, tailings with a view to treat the slimes by the modification of the cyanide process, as explained herein in detail some time ago. Mr. Butters went to Johannesburg in '91, to take charge of a chlorination plant at the Robinson mine. In those days amalgamation was the sole dependence of the Rand mines and about 40 per cent of the gold was lost. But little was known of the cyanide process, and Eastern mining journals pronounced it an "iridescent dream."

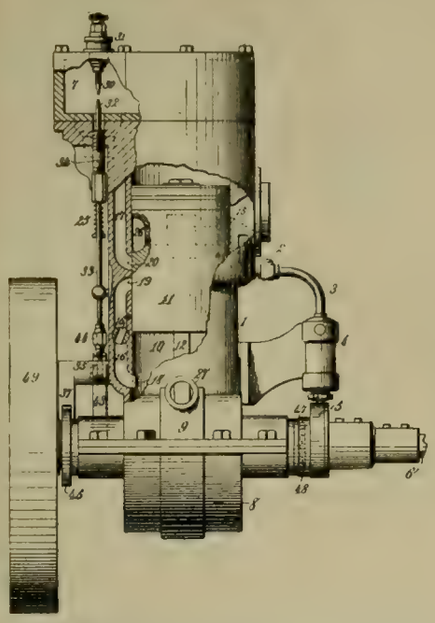
The MINING AND SCIENTIFIC PRESS directed the attention of the mining world to its economic value and explained it in scientific detail so thoroughly that after the first few practical tests its vast metallurgical importance was recognized. Shortly after Mr. Butters' arrival in Johannesburg, he organized the Rand Central Ore Reduction Co., which has ever since been a prominent factor in the gold output of that district. The nature of the Rand gold deposits makes them peculiarly susceptible to the action of the cyanide: it is the ideal process for such wherever found. Probably the most important recent work in that direction has been the practical creation of a new kind of gold treatment, in showing that gold may be profitably extracted from slimes by the aid of dilute cyanide solution accompanied by other economical adjuncts. In the way indicated have been successfully handled solutions containing from 00.01 to 0.01 per cent of cyanide, carrying from six to twenty-four grains of gold per ton. Slimes have been treated assaying as low as sixty grains to the ton. Mr. Butters is of the belief that there is a still wider field for the cyanide process and that "base ores" will ultimately be brought under its solvent influence and profitably worked thereby.

ELECTRICAL POWER from the Missouri river dam near Helena, Mont., has been turned on the engines at the East Helena concentrator and smelters, the Corbin concentrator and the Helena electric light works, street car company and all electrical apparatus in that immediate vicinity, successfully starting one of the most complete electrical plants in the United States. The extent to which this great force is being utilized lends encouragement to the belief expressed by its promoters that many enterprises, and especially that of mining, will be revolutionized in Montana. The dam was constructed at a cost of about $500,000, and two years were required to complete it.

Latest Mining and Metallurgical Patents.

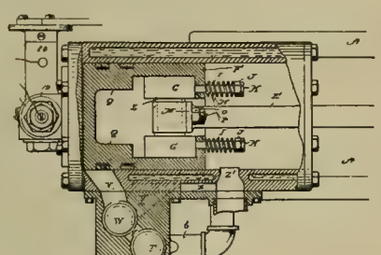
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

EXPLOSIVE ENGINE.—No. 617,372; E. E. Truscott, St. Joseph, Mich.; patent issued Jan. 10, '99.



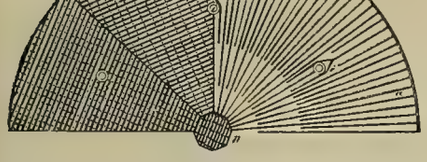
In a gas engine combination, a casing affording a mixing and a combustion chamber, a valve chamber communicating therewith, a valve seated in the valve chamber, passages formed in the casing communicating at their outer ends with the mixing and valve chambers, respectively, and at their inner ends terminating in adjacent ports in the wall of the cylinder, a piston therein having a pocket adapted to span the ports and to form therewith a direct communication between the mixing and valve chambers.

GAS ENGINE.—No. 616,388; E. & W. F. Bauratb, Springfield, O.; issued Jan. 10, '99.



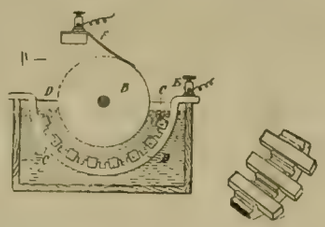
A gas engine combination of cylinder and piston rod, piston connected therewith by a slidable joint having a fixed limit in one direction and a yielding or spring limit in the other direction, the cylinder having an exhaust passage which is uncovered by the piston when it shifts in one direction relatively to the piston rod.

CYANIDE FILTER TANK.—No. 617,497; Philip Argall, Florence, Colo.; issued Jan. 10, '99.



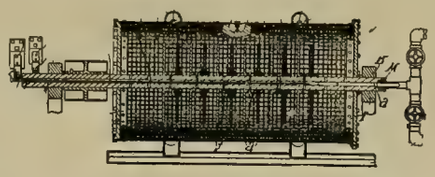
A cyanide filter tank, with a level tank bottom, having a central discharge opening, sloping gutters thereon, converging toward the central opening; a level filter floor above the gutters, having interstices, a permeable layer upon the floor, a permeable fabric as a top filter layer, packed at the circumference, and discharge openings at intervals through the filter floor and covering, having valve seats level therewith, and valves to close the openings, with means for operating them, and extending above the liquid level of the contents of the tank; a vertical metallic side or wall, a horizontal bottom secured thereto, having a central opening, a packing ring secured to the inside of the wall, near the bottom, with a spacing; a system of level joists converging from the perimeter toward the center, a plastic filling between the joists sloping downward from the packing ring regularly toward the central opening, a level floor with interstices laid upon the joists, permeable filtering material upon the floor and a covering of textile fabric, the outer margin of which is packed into the crevice between the packing ring and the vertical wall.

ELECTRO-DEPOSITION OF METALS.—No. 617,526; E. Emerson, Buffalo, N. Y.; issued Jan. 10, '99.



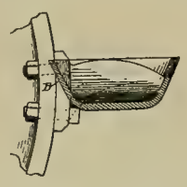
An apparatus for the electro-deposition of copper, the combination with a cylindrical cathode, of a series of horizontal anode bars in proximity thereto, and curved supports therefor composed of lead with lugs or ribs forming receptacles for the anode bars, whereby the latter are maintained out of contact with each other and in the same relative positions as they are dissolved.

SEPARATOR.—No. 617,512; L. E. Porter, Los Angeles, Cal.



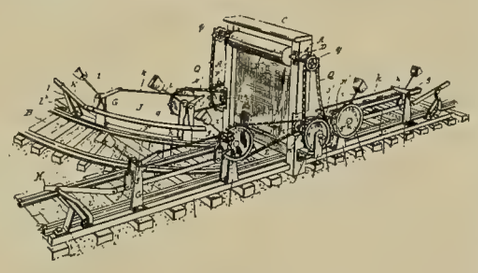
A combination of a rotatable barrel, a lining of filtering material arranged in the barrel and to leave a space between such lining and the walls of the barrel; an opening for introducing inside of the filter lining material to be treated, a closure for such opening, a suitable opening leading through the wall of the barrel into the space between the barrel and the filtering material, a removable closure for such opening, a housing surrounding the cylinder and arranged to catch the filtered liquor discharged through the opening when the casing is rotated and means for rotating the barrel at a high rate of speed, designed to separate precious metals from ores.

WATER-WHEEL BUCKET.—No. 617,555; F. K. Blue, San Francisco, Cal.; issued Jan. 10, '99.



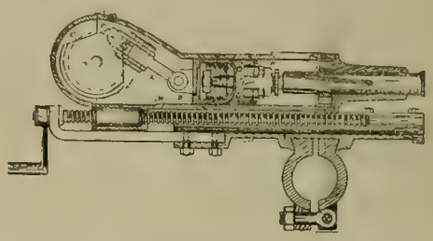
A water-wheel bucket combination with rear and side walls, of an inclined or curved ridge or dividing piece arranged within the bucket, the inclination of the ridge or piece being from front to rear so that the forward end thereof falls a given distance below the horizontal line of the side walls, the front wall of the bucket being united to and having its outer or side portions equal in height to the side walls, the central portion of said front wall being cut away to such a depth as to be substantially in line with the forward end of the central ridge or dividing piece of the bucket.

MINE GATE.—No. 617,669; N. K. Bowman, Lawrence, O.; issued Jan. 10, '99.



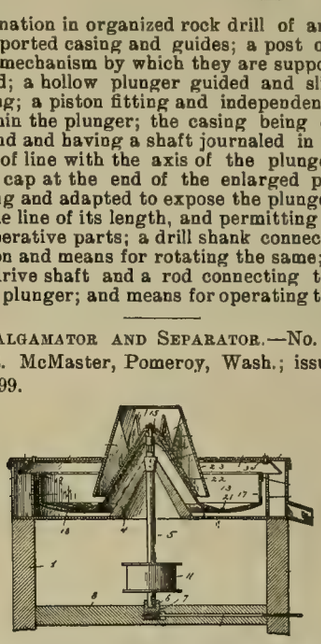
A combination of a track, of a gate frame arranged transversely thereof, a gate curtain mounted on a shaft having bearings in gate frame, provided at one end with a sprocket pinion, standards arranged alongside one of the track rails at opposite sides of the gate and having rock shafts journaled therein, each shaft carrying a crank arm and a counterweight, a rod connecting the crank arms of the rock shaft at each side of the gate to cause the same to move in unison, a master sprocket wheel mounted on the rock shaft of the innermost standard at each side of the gate; a swinging operating bar at each side of the gate and connected to rock shaft, an inclined trip lever connected to the outer end of each swinging bar, a countershaft arranged at one end of the gate and carrying a pair of sprocket pinions and a sprocket wheel, a chain connecting sprocket wheel with sprocket pinion on the curtain shaft and chains connecting the master sprocket wheels with the countershaft pinions, one chain being crossed to cause the swinging bars to move simultaneously in reverse directions, but toward or from the gate frame.

ROCK DRILL.—No. 617,407; Alfred Rosenholz, San Francisco, Cal.; issued Jan. 10, '99.



Combination in organized rock drill of an adjustably supported casing and guides; a post or standard and mechanism by which they are supported and advanced; a hollow plunger guided and slidable in the casing; a piston fitting and independently movable within the plunger; the casing being enlarged at one end and having a shaft journaled in this portion out of line with the axis of the plunger; a removable cap at the end of the enlarged portion of the casing and adapted to expose the plunger chamber in the line of its length, and permitting removal of the operative parts; a drill shank connected with the piston and means for rotating the same; a crank on the drive shaft and a rod connecting the same with the plunger; and means for operating the shaft.

ORE AMALGAMATOR AND SEPARATOR.—No. 617,466; J. R. McMaster, Pomeroy, Wash.; issued Jan. 10, '99.



In an ore amalgamator and separator, a combination of a rotating separating cylinder having a centrally disposed cone, a depressed bottom and an outer wall, a ring detachably connected with the upper end of the outer wall and provided with an inner flange to extend over the upper end of the wall, projecting into the cylinder, and a substantially vertically arranged feeder appearing as a truncated cone mounted to revolve with the cylinder, comprising an inner conical shell and an outer conico-cylindrical shell joined by radial partitions forming passages, the upper ends of the partitions being cut away on upwardly and outwardly divergent lines to form a chamber common to all the passages, the outer shell projecting above the inner shell and having an inwardly extending flange at its upper end.

Seattle's Ship Canal.

TO THE EDITOR:—The Seattle and Lake Washington Waterway Company, which began excavating a ship canal from Seattle harbor to Lake Washington, in 1895, have two dredges at work. Two channels are being cut through the tide flats, which join at the entrance to the main canal. Each tide-flat waterway is 1000 feet wide and 26 feet depth below dead low water. The main canal, 13 feet higher than tide waterways, is 300 feet wide and 26 feet deep, and is entered through locks having a 13-foot lift. The length of the canal from the locks to Lake Washington is two miles. The east waterway through the tide flats, one mile long, is complete and seventy-five acres of flats have been filled in to the depth of 18 feet. Lake Washington has seventy-one miles of coast line and the purpose of the canal is to obtain entrance to a fresh-water harbor.

Seattle, Wash., Jan. 7th, '97. WASCOTT.

THE man who to-day builds a fence around himself, and only progresses in proportion to the ability he has within himself, will soon become a back number.

EIGHTEEN years ago wire fencing cost 9 cents per pound. To-day it costs the consumer 2½ cents, and a pound means a rod of wire.

Electric Mine Signals.

Victor M. Clement, general manager for the DeLamar properties at Mercur, Utah, and DeLamar, Nevada, in a recent paper, discusses the various systems of mine signalling in different parts of the world. The old-fashioned system, the hand-pulled rope and bell, or flapper, is still used in English mines, the difficulty of which is that in very deep mines there is apt to be an uncertainty in its indications, and the engine room cannot always tell if each pull of the rope has produced a sound. In the United States a pneumatic system is used, consisting of a line of pipe and an air cylinder about 6 inches in diameter by 9 inches long, with a piston movable by a lever, which is employed to give a sudden push of air down the pipe line to blow a whistle all over the system. The pipe used is recommended to be at least 2½ inches, and even more, for long distances. The pipe should be smooth inside, as it then can be talked through, which is not possible with rough pipe, although signalling can be effected through rough pipe. Though by no means perfect, Mr. Clement considers electrical signalling, on the whole, the best.

If there are, say, balanced skips for which to arrange signals, there are three wires run down the shaft, two being connected to the poles of a battery and the third or middle wire being used to connect all bells in series and ring them simultaneously when a circuit is made through any push on the system. All bells are, of course, to be placed between the middle wire and the same pole wire, and the pushes between the middle and other pole wire. A separate signal should be arranged from the shaft mouth to the engine-room and vice versa, for the engineer could not otherwise tell whence the signal comes, whether from the top or the lower set of skips.

A bell at the shaft mouth keeps the surface man informed as to what the skips below are doing. Communication with the signals below must only be possible via the engineer's apparatus. The chief disadvantage of the system is that the engineer has no means of knowing the places of the skips except by the correctness of the signal given; but Mr. Clement has never known of an accident, as the bells ring simultaneously through the mine when rung from any one place, and those at any level know thereby where the skip is and what it is doing.

In a second system a separate wire is run to each level, the two battery wires being run to each level also, and when a signal is sounded it rings only the bell at the one place and a bell or indicator at the mouth and in the engine-room. This system simplifies the code of signals; the engineer knows what he is doing, but the cost and complexity are increased. The first system is that which the author advises. The wires may be run in either iron pipes or wooden conduits of deal two-eighths in thickness, run along the roof timbers in an incline, and coated in and out with coal tar, the wires—No. 18 S.W.G. and lead-covered—being held in position by wooden cleats and all bells and pushes being placed in wooden boxes. This system in one instance worked well for eight months, after which the settling of the shaft so stretched the wires that they broke, though no further trouble has since arisen. Though exposed to much acid water, the lead-covered wires had not been affected. When conveyed in iron pipes trouble has been found from internally condensed moisture and from grounding of the wires in the pipes.

In South Africa, among others, the Robinson Deep and the Simmer and Jack discarded a pipe system and installed a bare copper-wire system on double-petticoat insulators of porcelain. Little trouble was experienced. The wires should be at least $\frac{7}{16}$ S.W.G.; should be shackled off at distances of each 100 feet, and a bight made in the wire to run off moisture. Below a bight in the shaft the wire continues, not directly underneath the length above, but to one side. Armored cables should be pure rubber, insulated with a lead covering to the conductor and a steel-wire sheathing. Such a cable can be bent round corners without injury to any part. In vertical shafts it may be hung well up in the corner of the ladderway, and in inclines in an upper part of the skipway. Mr. Clements considers that armored cable is the best for signalling purposes. He considers that one quadruplex cable is fully as good as a pair of duplex cables—*i. e.*, one for the pole wires and one for the two middle wires. Steel-sheathed cable may carry its own weight in vertical lengths of 300 to 400 feet, the connections between the lengths being in water-tight boxes. At pump stations or landing stages connections should be boxed in for 10 to 22 feet above landings, and inclines cable ought to be removed from the risk of having hung on it lamps, tools, etc., and general precautions taken against injury.

There is no satisfactory signal bell known to Mr. Clements. Pushers in general do not give satisfaction. The galvanometer key is better. Pulls likewise are apt to be unsatisfactory, as they depend on springs, which are apt to fail by rust. For batteries the secondary cell is preferable for cleanliness and compactness. The Leclanche primary is satisfactory if properly attended. Whatever form be employed, there should always be an auxiliary. The E.M.F. should range from six to sixteen volts. Bells and pulls must be inspected weekly, at least, and all contacts kept bright.

A Continuous Rivet Heating Furnace.

A rivet furnace which has a fireplace below communicating by means of ports with a combustion chamber, into which opens a hopper surmounted by a chimney, is described by the *Engineer*. The hopper is filled with rivets through the door at the top, and when hot they are withdrawn through the combustion chamber by the upper door in the side. Thus the flame on its way to the chimney is drawn by the draught through a column of rivets 9 or 10 inches high, and while those at the bottom of the hopper are ready for use those at the top—if the supply of rivets be kept up—will always be nearly cold. The heat is taken up by the rivets very rapidly, and each rivet is constantly moving down by gravity into a hotter part till it is taken out ready for use at the bottom. This system of progressive heating results in great economy and speed of working, the furnace, although only 2 feet square by 5 feet high, being capable of heating 3000 ⅞-inch rivets per nine hours with a consumption of 200 pounds of coal, as against 600 to 1000 pounds burnt by ordinary furnaces. Air is admitted through a regulator in the fire door to ensure perfect combustion of the gases before they reach the rivets, and plenty of room is given in the combustion chamber for thorough mixture of the air with the gases. If properly worked the furnace makes no smoke. When rivets of different lengths are wanted they are put in the hoppers in layers, and preserve their relative order in their descent through the hopper. Special rivets may be put into the combustion chamber through the extraction door. The furnace can be easily moved from place to place.

In a borehole, about 300 m. (984 feet) deep, put down near Ostroppa, in the Gleiwitz district of Silesia, by the Ober-Schleische Tiefbohr-Gessellschaft Zollner & Co., the end of a boring rod was broken off, so that it became impossible to continue boring, owing to the pieces of steel in the hole, because all the diamond crowns were ground off. After three weeks had been spent in various but unsuccessful attempts to remove the pieces of steel, application was made to a representative of the Electricitats Aktien Gesellschaft to extract the broken pieces in the following manner: A bar magnet was constructed ½ m. (4 feet 10 inches) long and 70 mm. (2¾ inches) diameter, which was surrounded by a single winding of wire insulated with indiarubber, and was magnetized by the current of a small dynamo driven off the portable engine provided for the work of boring. The current was easily regulated by a simple water resistance, and kept to the constant quality of about 30 amperes. The magnet was let down unmagetized; and, after it had come in contact with the bottom of the hole, the current was switched on to the winding through the rope used for letting down the magnet. On the first day that the arrangement was brought into operation, the pieces of steel in question were drawn up, so that boring could be continued. The pieces stuck so fast to the end of the magnet, capable of lifting 50 kg. (1 cwt.) that they could only be released by the application of force. Inasmuch as the work of boring is often interrupted by pieces of steel being broken off and becoming tightly jammed in the hole, this method, which constitutes a valuable addition to the accessories of boring, will probably be often employed.

The Mansfield Copper Mining Co. in Germany have lately introduced at the Otto mine two machines designed for lifting the mine cars. These lifting cylinders are worked by means of compressed air, their purpose being to effect a quicker and easier transfer of the cars from one track to another than was possible with the hoisting screw previously in use. A compressed air cylinder is arranged upon a movable frame suspended at a height of 6 feet 8 inches. The frame can be moved on the rails with great ease, the air being supplied by an india rubber hose. The piston rod of the air cylinder is connected to an arrangement of levers, which are arranged for the purpose, grabbing and lifting the wagon as soon as the air valve is opened. The releasing and lowering of the wagon is effected by opening the exhaust valve. The arrangement is, of course, very similar to the compressed air hoists which are now largely used in foundries and other shops. Where compressed air plants are laid down the use of these effects great economy, and their construction is so simple that an excellent home-made job is easily possible.

The specific gravity of the earth has been found by Dr. C. Braun to be 5.52765—the earth weighing about five and one-half times that of a globe of water the same size.

Silicification in Ore Deposits.

Discussing Idaho mining districts, Waldemar Lindgren says of ore deposits in general:

Mr. S. F. Emmons, in his studies of the mineral deposits of Colorado and other parts of the Rocky mountains, has admirably and with deserved emphasis brought out the fact that replacement is a process to which many deposits owe their origin, and that it plays an important part in almost all deposits caused by mineral-bearing waters. Carried away with the importance and interest of these results, many geologists and mining engineers have, however, extended the theory of replacement beyond its proper bounds, and speak of every vein-filling and even of veins of solid white quartz as products of replacement. Against this view a strong protest should be entered. In this connection it may be of interest to consider, briefly, the processes by which silicification may be produced.

In the case of ores consisting of carbonates there may be some difficulty in deciding what is filling and what is replaced country rock, for carbon dioxide and alkaline carbonates are very strong solvents, attacking easily nearly every one of the rock-forming minerals and forming pseudomorphs after them. The carbonates may replace a rock completely, wholly changing both composition and structure. As an instance may be cited the coarse-grained mixture of carbonates and mariposite (fuchsite—a chromium mica) resulting from the replacement of the serpentine along the mother lode of California.

As to quartz, the conditions are wholly different. A solution of silica is comparatively inert and does not easily attack any of the rock-forming silicates. Silicification may take place by two greatly differing processes: (1) Cementation, or filling of the interstices of porous or shattered rocks by quartz deposited from solutions; (2) metasomatic silicification, or a substitution of silica for other minerals, the silica either being produced by the alteration of the original minerals or deposited pari passu with the dissolving of the original mineral by active reagents in the waters causing the metasomatic action.

The first process is often observed in the silicification of various sedimentary, porous rocks, chiefly sandstones or tuff or porous igneous rocks, such as certain trachytes and andesites. Silicification by the cementation of shattered rock masses by silica is, of course, a common occurrence in and near quartz veins. But silicification by replacement is a less common process, and is observed chiefly in the case of easily soluble rocks, such as limestone or calcareous shales, when it results in fine-grained or cryptocrystalline aggregates of silica. In the metasomatism of bodies of massive rocks penetrated by chemically active solutions silica is formed in many ways, as by the carbonatization of silicates and sericitization of the feldspars, and if no open spaces are available much of this free silica will be deposited within the rock, usually as fine-grained aggregates more or less mixed with opal and chalcedonite. If no material were added the final result of this would not, however, be a silicification, but merely an increase in the total free quartz of the rock. But in case the rock mass is cut by fissures it appears that most of the resulting free silica is not deposited in the rock, but finds its way out in the open ducts, where, if the solution is supersaturated, it will be deposited. In fact, in the metasomatic processes in the ordinary igneous rocks adjoining gold-quartz veins, late investigations have shown that certain elements are added to the rock, while others, notably silica, are frequently subtracted, to be carried away or deposited in available open spaces.

As for the other possible process of silicification, or a dissolving of the original mineral and a deposition of silica pari passu, it occurs chiefly in easily soluble minerals, such as calcite. In case of the ordinary rock-forming silicates it is apparently not common. The resulting silica is generally in the form of fine, cryptocrystalline aggregates. Rocks silicified by either of these metasomatic processes, or a combination of both, may occur, but, so far as the writer's experience goes, are not often encountered as wall rocks or auriferous quartz veins. But neither of these processes can have produced the massive, white, coarse-grained quartz of gold veins belonging to the normal type. This quartz, which contains native gold and sulphides, shows, under the microscope, a peculiar, coarsely granular structure, the grains being partly bordered by crystallographic surfaces. This structure could have been developed only by free crystallization in open spaces. It is scarcely necessary to call attention, in addition, to the frequency of comb structure, etc., proving also the same kind of origin. This does not necessarily mean that all large bodies of quartz have been deposited in an open space, as large as the volume of quartz now is. Repeated openings of the fissure have doubtless often taken place.

In nature the complication of the fissure veins is often great, and it is clear, in fact, that it must be so, for the walls are often shattered, resulting in alteration of the country rock and deposition of a net of quartz in the interstices. Ground-up mud often fills the fissure, and the result of the action of the solutions on this will be a mass of grains of altered rock, cemented as in a sandstone by quartz.

The Headwaters of the Lewis River.

Written for the MINING AND SCIENTIFIC PRESS.

Although, during the season of '98, the interest of the great rush was centered upon the Klondike and its neighboring streams and rivers, still, as in former years, the upper portion of the Yukon drainage system attracted some attention, especially since the commencement of the Atlin boom, in spite of that being more smoke than fire. This article deals with the limits of the watershed of the lake system, forming the main headwaters of the Lewis river, to its junction with the Teslintoo or Hotalinqu river, a scope of country comprising an area of 100 miles in width by 300 miles in length. While confined to the above area, it is applicable, in almost all of its points, to the rivers that flow into the Lewis and Yukon to and including Sixty-mile river, as the greater portion of their courses run through the same belts of formations and have been subjected to similar conditions. In brief, it is the summing up, from a mining standpoint, of the results obtained from past prospecting, together with the observations, examinations and deductions made during a season's close study of this section by the writer.

As throughout the rest of the Cordilleran system in these latitudes, the formations lie in more or less well defined belts trending in a general northwesterly direction, while the principal deviations in character, latitude and direction are usually the results of local volcanic disturbance. These belts of formations are composed of granites, feldsites, slates, schists, quartzites, sandstones, conglomerates, marbles and limestones, and the series, in its main parts, is repeated over and over again throughout the breadth of the district. These formations contain vast amounts of roofing slates, fine marbles and other building stones, while occasional narrow seams of coal are found.

True fissure quartz ledges are rare, although some of the belts of schists and slates are seamed by quartz stringers which "kidney" more or less. While it is easy to get high assays out of the kidneys, the ore, which usually contains both silver and gold, is not free milling, except when oxidized, and thus far it has seldom been found in commercially valuable quantities. While the writer has not seen any quartz in place which it was worth while to develop under the existing conditions, still he heard of some, which he was unable to visit, that was claimed to be something extra. If there is as much of it as is claimed, and if it will work within 50% of its assay value, it is a remarkably good thing; but the assays are high enough to warrant a searching investigation before accepting them as proof positive of even the average assay value of the ore body.

Aside from the quartz stringers, etc., there are whole belts of formations or quartzite impregnated by sulphurets of iron, with sometimes a slight sprinkling of copper pyrite. In places these mineralized formations are visible for miles. There are also huge chambers or bodies of ore, apparently formed by segregation, in these formations, and in such places the formations strongly resemble those of the Rossland district. Some of these chambers yield fairly good assays, but, although richer, like the rest of the formation they are both base and low grade. It is quite possible that somewhere along the course of these belts mineral districts of value will be found.

Like a large portion of British Columbia, the whole surface of the country is thinly sprinkled with fine gold, which is concentrated into paying quantities in but few available localities. This gold was released from the crystalline rocks and mineralized formations by two agencies: First, by glacial action; second, by the subsequent erosion, which, although far less than the first, both in time and effect, has milled no inconsiderable amount of rock, as is shown in places by the remnants of ancient surface contours. But, although the greater tonnage is to the credit of the glacial action that planed down mountains, carved out lake basins and cut river valleys through range after range, still the subsequent erosion has done and is doing a very important work in reworking the immense glacial and postglacial deposits and concentrating the fine gold contained therein along the lines of the present water courses. In consequence of this, the best pay is to be expected in the river beds, as it collects the most where the greatest amount of reworking is going on. From these bars, such as those in the Lewis, dredgers similar to those employed on the Snake river in Idaho would solve the problem of reclaiming the gold at a profit. In the mountains the grades are too steep and the bedrock unfavorable for the accumulation of gold in paying quantities, and when not too steep they run either among marshes or else empty into lakes, and, on account of the loose character of the gravel, nearly all of the gold works down to bedrock, from whence it can seldom be regained except at a loss, although, when nature shall have drained the marshes and lowered the lake levels, our highly-evolved descendants will find some spots rich in fine gold.

With the exception of where the placer gold is simply the residuum from the wearing away of vast masses of crystalline formations, when fine gold is found along river bars the legitimate inference is that the tributary streams which head in or flow through the mineral-bearing formations will contain coarse gold, but in this district coarse gold is the exception and can only be expected where the mineralized formations are better than usual. As a rule, the streams contain just enough gold to keep a prospector going until he is not only dead-broke but in the hole, and when he has eaten his last bacon rind he is no nearer the pay diggings for which he is searching than he was when the string of gold in his first prospect dazzled his eyes and set his hopes on fire.

In regard to the value of the mineralization of the formations, one tendency has been noted which, while it is distinct enough to attract attention, will require considerable investigation to unequivocally confirm or disprove: That is the apparent tendency to grow richer with the progress eastward from the summits of the passes until the auriferous belts of slates, schists, etc., are reached, in which the Big Salmon heads on the west and near which the Liard heads on the east. These belts follow the usual trend and, as far as can be judged at present, the westerly side crosses the Yukon near the mouth of Sixty-mile river, while the easterly side crosses some distance below Dawson. Should this theory prove correct, and it is in accordance with all known facts, the premier mining districts, both for quartz and placer, will be found along the course of these belts.

Returning to the area under discussion, thus far the best gold has been found in the Lake Atlin country, in the locality where it was first discovered some five years ago. Were it not for the grossly palpable efforts made to boom that region, the excitement of the last summer and fall would merit more attention; but when, at the rate of wages claimed to have been paid, the "big" run that, aside from blow, gave rise to the first excitement, only paid the men during the run itself, without leaving the owner a cent; when pay is being taken out of only one claim, and yet the same men are seen day after day along the line of travel from Bennett to Skaguay, exhibiting sacks and bottles of dust as the results of cleanups from their claims; when returning Klondikers recognize the large nuggets, exhibited as a product of the Atlin claims, as having been mined out of the Skookum diggings; when all of these and more are facts, one is to be pardoned for receiving all glowing accounts with the scrutiny of suspicion.

However, there is some pay there, and, in addition to the omnipresent fine gold, the diggings contain mustard seed and flaxseed gold, which are easy sizes to save. On account of the poverty of the benches and the loose character of the gravels, the spots of pay being below the surface of the water and beyond the action of frost, the flat grades, where the greater portion of the pay is located, the lack of dump room for tailings, and the small size of the claims, the profitable working of separate claims is well nigh an impossibility, even where a company could make money by consolidating the various interests at a reasonable figure and fluming and working the stream from the mouth up. In other words, nearly all of the money made in the Lake Atlin region will be made by companies, and not by prospectors. This is also true of the remainder of the district under discussion.

A. THURSTON HEYDON, M. E.

Reverberatory Furnace Smelting of Ores.*

By THOS. J. DYSON.

Following is a description of a method in use at a European smelting works. The practical results may be of interest, particularly the percentage of extraction of metallic lead. The object of the process at the European works is more the rapid extraction of silver from rich ore rather than that of the lead, but nevertheless the latter does not suffer on that account.

The operation is based on the mutual reduction of oxide and sulphide of lead when heated together, the separation of the reduced lead being assisted by carrying out the reaction on a bath of the latter metal. As the slags formed often amount to 60 per cent of the weighing of the charge, they undergo a liquidation after removal from the bath, to insure the separation of the entangled portions of reduced lead.

The sulphide ore is chiefly a galena carrying about 37 per cent lead and 1 per cent silver, with which small quantities of pyritic ore of like grade in silver are mixed, and the oxidized ore, a carbonate containing 68 per cent lead and 0.048 per cent silver, this being replaced by litharge when in short supply. The sulphide ore is delivered in a fine state and the carbonate must also be fine, but the litharge acts satisfactorily in roughly broken lumps. The furnace is an ordinary softening furnace, with a charge hole in the roof; a sheet iron box, with a lining of firebrick 16 inches thick, serving to confine the lead bath.

From the firebridge a small hearth 3 feet 6 inches, with a door at each end, slopes at an angle of 25° to the edge of the bath, serving as a liquation hearth to drain off the lead entangled in the slags before their final removal from the furnace. On starting the furnace is brought to a red heat in fifteen hours with a consumption of 1600 pounds of coal. The bath is then charged with some 10,000 pounds of blast furnace lead, containing usually 0.1 per cent silver. When melted the drosses are skimmed off with a perforated shovel and deposited on the inclined hearth, the bath being now about two-thirds full of lead.

A sheet iron funnel is introduced into the charging hole, the damper closed to minimize loss of dust, and 500 to 600 pounds of the sulphide ore is dropped on to the surface of the bath, where it readily spreads out. The funnel is withdrawn, the damper opened and the fire urged until the ore begins to cake on the surface, when some 400 pounds of carbonate ore or litharge is spread over it. The drosses lying on the inclined hearth are now well rabbled for ten minutes, then the ore mixture on the bath for a like period, these operations proceeding alternately until the drosses and the ore have been worked over three times. After the third rabbling of the ore charge four or five shovels of coal dust is thrown over the bath to reduce excess of litharge, formed by the exposure of the lead during rabbling, the drosses on the hearth are drawn into slag pots and the slag floating on the bath is removed with perforated shovels and transferred to the inclined hearth.

A fresh charge is let down on the bath and the alternate working over of the ore charge and the slag on the inclined hearth proceeds as before. The time from charging to skimming is two hours, a charge thus remaining four hours in the furnace, *i. e.*, two hours on the bath and two on the inclined hearth.

When some twenty charges of the ore have been worked off the silver in the lead bath rises up to 1 per cent, and the lead is tapped out and sent to the cupelling furnace, the slags in a fully oxidized condition and well fritted to go to the blast furnace.

The following is a record of the ore and lead charged, and the product obtained from 112 charges, the bath being filled and tapped five times:

CHARGED.

	Weight.	CONTENTS.	
		Lead.	Silver.
	Pounds.	*Pounds.*	*Ounces.*
Sulphide ore	60,450	20,771	11,268
Carbonate	37,478	25,485	262
Litharge	10,141	8,619	135
Blast furnace lead	.....	51,697	1,682
Totals	108,069	106,572	13,347

WITHDRAWN.

	Weight.	Lead.	Silver.
	Pounds.	*Pounds.*	*Ounces.*
Rich lead	.....	82,293	12,047
Slag	68,078	20,158	554
Totals	68,078	102,451	12,601

Of the 54,875 pounds in the ore charge, 55.75 per cent is obtained in the metallic state, 36.75 per cent in the slag, and 7.5 per cent unaccounted for.

Of the 11,665 ounces of silver in the ore charge, 88.84 per cent is obtained in the rich lead, 4.75 per cent in the slag, 6.41 per cent unaccounted for. This percentage of silver is not all loss; a great portion of it is recovered when poorer ores are worked in the same hearth, the absorption of silver being heavy when rich ores are treated.

At one time galena containing 70 to 75 per cent lead was roasted to sulphate to be used instead of carbonate ore or litharge, but did not give such economical results. As might be expected, the latter were cheaper oxidizing agents.

Galenas containing 75 per cent of lead, poor in silver, when worked as described for the rich ore, furnished 75 to 80 per cent of their lead ready for the zinkage pots.

The operation I have described is conducted with an ore mixture of about 50 per cent lead; and after a large expenditure of hand labor on small charges, moderate temperature at which the oxidized and sulphide compounds of lead react best, and finally careful liquation of the slags away from the lead bath, the result is 55¾ per cent of the contained lead as metal. When clean galenas are treated in the same way the percentage production of metallic lead at once makes an increase of 20 to 25 per cent.

From a charge of six tons of concentrates the least likely amount of slag is about three tons, and three tons of a slag consisting of a sticky mass of silica, oxide of zinc, etc., more or less saturated with heavy oxidized lead compounds, is liable to hold an unpleasant amount of entangled metallic lead, and still further reduce the production of metal, besides reducing the capacity of the furnace, unless some means of liquation is provided other than rabbling on the surface of the bath. The slimes containing 15 to 25 per cent zinc and 25 to 30 per cent lead might with advantage be left out of the roast reaction process,

*Condensed.

Some Experiences of a Working Miner.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS.

Why is it some men can never learn from experience? Not long after talking myself out of a job at the P—— mine, I found myself at G——. Here I found two men who professed to be miners. In the course of conversation, I learned that they were driving a tunnel by contract at a mine in the neighborhood, and they expressed the belief that they were "stuck," for the reason that they were working through the "hardest ground in the State." I inquired as to the character of the ground and was informed that it was slate. As slate is not ordinarily an extremely hard rock, I volunteered to accompany the boys to their tunnel the following morning, as I wanted to see this particularly hard slate. I found the rock a common, black clay slate, not very hard, but, on the contrary, rather easy ground. A hole had been drilled 18 inches in the face. This hole was driven directly in horizontally and was cutting straight across both strike and dip of the slates. They started to drill the hole deeper, and did put it in 18 inches farther. I thought I would not interfere for a while, and they drilled two more deep holes in the face—one near the top and the other a little above the bottom of the face. Near noon these three holes were fired, and after lunch we all went in to see the result. We found what I had anticipated—the collars of each hole blown off and only a few wheelbarrow loads of rock broken.

"What are you going to do now?" I inquired.

"Load and fire them again," was the answer.

"And what will be the result of this second charge?" I asked.

"It will break out some more rock and 'kinder' shake up the ground; so when we put in the corner holes we can square up," was the reply.

The second charge was fired and a little more ground was broken, but the slates were not much shaken up by it. Well, they worked all of that day and all of the next to square up the tunnel, and half of the third day to clean up. At this rate they were not getting rich very fast. When they had finally squared up their work, I suggested that if a center cut was first made, by pointing holes from the sides toward the center, each hole to be 18 inches deep, and following these by holes pointed at proper angles both above and below the center cut, that proper progress might be made. Acting on this advice, the boys took out nearly double the amount of ground in a given time that they had been able to do before, and used less powder to do it. They were now making money, and concluded that the ground was not so very hard after all.

I worked for some time at a famous mine down on the Mojave desert. It was a good mine and paid handsomely. The vein was clean, well defined, and from 3 to 10 feet wide, dipping steeply south near the surface, but down on the 400 level was quite flat. This mine was timbered with square, sawed timbers, which were placed as props. Every miner knows that posts so used should be placed in the mine nearly at a right angle to the hanging wall—that is, slightly above a right angle—so that, should the hanging wall have any tendency to subsidence, the posts will take the weight and hold the ground in place. Our superintendent had some remarkable ideas about timbering, and had all of these stulls set in an exact line and absolutely perpendicular; had them set in with a hand-level, too; they had to be absolutely vertical—and this with the walls pitching at 30° to 45°. We remonstrated with him, but to no purpose. After a few weeks these posts began to show a disposition to move from the vertical, the foot slipping downward. To counteract this, braces were placed extending from the foot of the posts to hitches cut in the hanging wall. These braces were nearly horizontal, so they did little good further than keeping the foot of the post in position; but then the tops of the posts began to move backward. To make a long story short, those stopes are not open now. The whole business "jackknifed" and the stopes were lost. Fortunately, no one was injured, as the ground had given sufficient warning of approaching collapse, and the men were all elsewhere when the cave occurred. They have a new superintendent at that mine now.

I must tell you about the big mill at H——. This mill was crushing ore from the Q—— mine when I was there, and it seemed to be a pretty fair sort of mill, excepting for the fact that the timber frame was rather frail for the size of the mill, particularly as there were large ore breakers of the Blake type on the upper floor, creating such a vibration as to tend to injure a mill of heavy frame; but in a light structure it is enough to make one seasick. Eventually they had to brace the mill up with long props; but it was not this that I wished to speak of particularly. H—— lies in a little valley among the hills and a first-class mill site might have been selected almost anywhere on the surrounding slopes, but the management did not appreciate the natural advantages about, but chose the center of the flat for a mill site. If there had been an abundance of water at H—— it would not have been so bad, but water is scarce and the tailings soon began to pile up in front of the mill. They might have been conducted some distance in a flume, but they were not, and continued to pile up. After a while they dammed up and began to flow into the mill. A gang of shovelers was kept at work for a time, but that was too expensive. Then bucket elevators were tried, and these piled the tailings higher and higher until they had reached the height of the eaves of the building. I have been informed that the mill has since been moved to a more eligible site. It reminds me of a man I once heard of who allowed the refuse of his stable to pile up about him to such an extent that he chose the plan of rebuilding his stable at another part of the ranch rather than remove the debris. There are many ways to build a quartz mill, but it is a poor plan to build upon a flat when a hillside is at hand, simply to save the cost of grading. Of course, if a large stream of water is flowing by, that would alter the case materially.

I want to show you how little advice is appreciated when it is not paid for. A prominent gentleman now living in the southern part of the State, after describing his mine to me, asked for an opinion as to the advisability of driving a long crosscut tunnel to tap the vein several hundred feet below the croppings. My advice was that he continue sinking his inclined shaft on the vein and develop ore enough to justify the working tunnel he proposed. Two years later I found he had disregarded this advice and had driven the tunnel, crossed the vein where it was very small, and passed more than 200 feet beyond it, without realizing that the vein had been reached. He also erected a mill at large expense and milled about forty tons of ore. The worst feature of the whole affair was that he didn't have enough ore to keep a 1-stamp mill busy, and what he did have was almost worthless. This is one of the failures that condemn mining as a legitimate business. MINER.

Forestry in California.*

By ABBOT KINNEY.

Forestry has two distinct objects: First, the economical utilization of the forest resources. This comprises not only the fuel and timber supply, but also the application of methods that will insure the renewal of the forest crop and protect both the mature and growing forest from waste or destruction by fire. Second, the maintenance of forest conditions upon watersheds for the purpose of regulating the delivery from these of the rainfall. Social and economic conditions, together with topography and climate, determine the relative importance of these two objects of forestry.

In southern California the second reason for rational forestry altogether dominates the situation. Nowhere in the world is there greater need of efficient forest management than in southern California. Nowhere in the world do topography, climate, social and economic conditions so completely unite in indicating the need of forest preservation.

The mountain ranges divide the fertile areas of southern California from the great Mojave and Colorado deserts. These mountains rise abruptly without foothills from the rich, irrigated valleys of the south. The Sierras are steep, difficult of access, practically unoccupied and entirely incapable of agricultural use. The ranges rise like a wall to an average altitude of 5000 feet immediately above the valleys. The peaks are from 10,000 to 12,000 feet in height.

The tendency of the rainfall delivery arising from this topography is toward immediate and destructive floods. The torrent rushing out into the valley with sand, mud, gravel and boulders already alternates with prolonged absence of water in the flood courses. The only modifying influence is the forest covering of the mountains. This forest consists of only small areas of merchantable timber, all of which are immediately about the peaks of San Bernardino and San Jacinto. Even this timber is of such inferior quality and so difficult of access, that it is not now being exploited. The main forest covering of these mountains consists of chaparral and brush. This covering holds the soil on the steep mountain sides and detains the rainfall delivery so that time is given for it to percolate into the water veins and natural reservoirs. Where these watersheds are burned over the importance of the forest covering is at once demonstrated. In such districts the destructive force of the floods increase. Torrents do great damage, both in covering good land with useless debris and in cutting and carrying away other good land. The rainfall is thus suddenly delivered to the injury of all. On the other hand, the perennial character of springs and streams is diminished or destroyed. The water that the forest covering insures to the permanent water supply is wasted and lost when the forest covering is destroyed.

When the forest is gone on these steep Sierras, floods and torrents alternate with wide and arid wastes of waterless torrent beds. The forests are absolutely confined to these steep Sierras.

The Sierra Madre wall has upon one side the great deserts. In these there are a few scattered oases. Promising mining districts are frequent and there are a number of fine productive mines. In the far south there is in the desert an alluvial plain to which the Colorado river may some day be diverted. The climate is intensely dry, almost rainless, and for eight months these deserts are at present a fiery waste. On the other side of the Sierra wall nestle the beautiful protected valleys of southern California.

In these valleys, settlements and homes succeed each other and join hands. Thriving towns and cities are supported and the enterprising metropolis of the southland has 120,000 inhabitants. The life of all these homes and towns is in part derived from tourists coming in winter from the northern States and in summer from the desert mining population, from Arizona and even from Texas and the Gulf. About $10,000,000 is annually spent here by tourists, but its main reliance is upon intensive agriculture and horticulture.

All this is due to the condensation of moisture by the Sierra Madre range. All of it is due directly or indirectly to the rainfall in the valleys and on the mountains which supply these districts with water. The condensation of moisture into rain by the Sierra cannot be aided and may be diminished by the removal or destruction of the chaparral and forest on the mountains. Deforestation will surely increase the extremes of temperature in our valleys. It will increase the dryness of the air. It will increase the evaporation and is likely to diminish the moisture condensing power of the Sierra.

Extensive deforestation will diminish condensation of moisture in such areas. If it does not diminish the rainfall it is likely to change its character. The tendency will be to make the precipitation more sudden and violent. The rains then more and more become diluvial. The periods are short and the precipitation heavy.

This sort of rainfall promotes flood action and diminishes springs. Besides these results of deforestation, we know absolutely and from our own local observation that forest and brush destruction on our mountains does increase torrent action and diminish springs. We know that the canyons and streams, the watersheds of which have been thus injured, deliver a greater amount of debris to the valleys than before. Our local experience fully confirms the experience of other countries. Valleys, the world over, have been destroyed and depopulated by the deforestation of their mountains. Hundreds of instances are of record like that of the valley of the Durance in southern France. The forests on the hills and mountains of the watersheds of that river were destroyed and burned over by sheep men to increase the pasture. At first the pastures were improved, but in the end the soil was carried off by the increasing floods and the forest was followed by the grasses and nothing was left but the bare rocks and desolate gulches. The river, which was a perennial stream and navigable, with a well defined channel while the forests existed, became after the destruction of these a torrent and flood course. Navigation was ended. The channel was filled up with the mountain debris. Two hundred thousand acres in the valley were covered by debris from the mountains and ruined. Thus the forests were destroyed and all forest supplies ended.

Southern Europe, northern Africa and western Asia show us not only valleys, but whole nations injured or destroyed in their means of support by forest destruction. In no country is the folly of sacrificing mountain forests to sheep pasture more clearly illustrated than in that once great and now moribund, kingdom of Spain.

We have no sheep interest to contend with in establishing a forest system in the Sierra Madre. We have no enemies from selfish interest to stand in the way of rational forest action in our Sierra. The political office-holding class is the sole handicap to efficient action. The plan that follows says nothing about a civil service or a forest patrol and government by men of forest knowledge and physical capacity to meet the requirements, but that must inevitably grow out of a system fed by a forest school like West Point, in producing competent men of honorable ideals and security of position while the service is efficient. Forest management requires men of special knowledge in forestry. A forest fire alone is a serious study. A mixed gathering of hastily enrolled men under a clever politician is not a promising forest protector or forest fire extinguisher.

The attractiveness of southern California will be lessened by burning off and destroying our mountain forests. The floods and torrent action will increase to the destruction of valley lands and property. The springs and streams will be diminished by forest destruction. The climate will be unfavorably affected. To us forest destruction is all loss and no gain. What shall we do to be saved? You know what has been done. After long fighting and agitation, forest reservations have been made in the most important districts. A few military forest patrols have been sent out, but only in what are called national parks and not at all in the forest reservations proper. This year the Department of the Interior has at last recognized the needs of forest management and forest protection. Its initial work in this line has been inefficient and practically worthless, but it is of great value in recognizing the need of forest management.

*Condensed.

Mining Summary.

ALASKA.

Juneau *Record*: The mounted police of the Northwest Territory have again placed the ban on prospectors risking their lives by plunging into the interior without money and with very light outfits. A required outfit of supplies and money must be carried. They object to prospectors going into the interior with a few hundred pounds of supplies and no money, with the intention of throwing themselves on the charity of the police in case they get stranded. This year the requirements are rather stiff. In order to go to the Yukon one must have three months' supplies and $500 in cash, or six months' supplies and $200. Klondikers who came out past Tagish post were told by the captain of police in charge there that these regulations would be enforced to the letter. The rule does not apply to prospectors going into the Atlin country. Old-time Yukoners, those who have property in the camp and who are returning for the winter, are not compelled to show money and supplies. They are compelled, however, to prove their identity to the satisfaction of the officer in charge.

ARIZONA.

A strike of sulphide ore is reported to have been made on the property of the Cochise Copper Co. near Bisbee and the owners are pushing development work.——Recently J. F. Stone and S. F. Knox made a tour of the Colorado river above the Grand canyon. They belong to a company which proposes to dredge the river for gold. They located 150 miles of the river above Lee's ferry and will soon begin work there on a large scale. At Chicago the company is building a dredge boat which will be worked by electricity. Extensive preparations are being made for the work to begin next spring.——Near Globe the Black Warrior group of copper properties includes many claims, but the great part of the work has been done on the Black Copper mine, which is opened to a depth of 200 feet with crosscuts and drifts in which copper ore has been found. For two years the Black Warrior camp has been a producer of high-grade copper sufficiently rich to make it profitable to haul to the United Globe smelter. An Eastern company is being organized to operate the Sultan group, the Continental, the Black Warrior and the Gerard Co.'s properties. A company has also been organized to build a 20-inch gauge railroad to connect the Black Warrior properties and Eagle iron claims with the Gila Valley Railroad at Globe. As soon as possible an extensive smelting plant will be erected by the Black Warrior.

The London Exploration Co. is operating drills and cleaning up for active work on the Ray mine, near Riverside, in Pinal county.——Clack & Poland, leasers, are said to be taking $20,000 per month out of the Oro Plata mine, near Yuma.

T. Fox recently leased and bonded a lead mine near Stein's Pass for $4000, and several men are taking out ore.——In the Volcano mine, near Stein's Pass, ore is being taken out that averages over 100 ounces in silver. The ledge is reported to be over 3 feet thick.——W. H. Allbritten, near Stanley Butte, encountered a deposit of ore that carries copper up to 35 per cent and gold value $35.——From the Blue Jay mine, near Tucson, at the 359-foot level the gold and silver ore goes $50 a ton.——A cyanide plant will be put in at the Mocking Bird mine, Weaver district, near Yuma, capable of working ten tons daily. The Mocking Bird contains ore that can be cyanided as well as several hundred tons of tailings.——Leasers on the Golconda mine are getting out good ore. The Golconda is in Union Basin.——E. Gilbert has men at work on the Standby, at Cerbat, taking out ore that runs well in gold and lead.

F. Vomicil at Castle Dome has 160 tons of silver-lead ore on the dumps; sacking and hauling it to Vomicil Landing on the Colorado river, twenty miles distant, is in progress. By steamer and rail it will be conveyed from Vomicil to the smelter. This ore carries from 30 to 100 ounces of silver to the ton and 65 per cent lead, and three tons per day is the output.——The Redondo group of copper-gold claims, consisting of seven claims at Copper mountain, has begun development on a large scale.

M. McLeish of Denver, Colo., last week bought a large dump of tailings at the Mammoth mine at Goldfield. There are 30,000 tons of tailings in the dump and a plant will be erected for their treatment without delay.

In the Volcanic mine in the Eagle Tail mountains recently a 4-foot vein of high-grade copper ore has been opened.——From the Loudon and Gallen mines in the Whetstones, on which O. B. Hardy has a bond, there are sixteen men working. A carload shipment of ore was made last week.——G. W. Herdman, of Jerseyville, Ill., representing Illinois capitalists, purchased from G. A. Whiteford a group of four mining claims located on Mineral creek, near Florence, for $25,000 cash. A few men are working on the claims, and as soon as the organization of the company is completed, a larger force will be put to work. They will also erect a stamp mill at the mines.——On the 200-foot level of the Lone Star, near Mineral Park, the vein was crosscut, and a body of good ore was struck.

Near Oro Blanco, a strike at the Ragnaroc mines near Tucson, was made recently. The ore is high grade, free gold, and at a depth of 500 feet, the deepest workings in this section.

Bisbee *Orb*: After over two weeks of idleness the furnaces at the Copper Queen smelters were fired last week and the first copper matte of the output for the year 1899 was turned out. By the introduction of the electric slag cars, the labor of forty Mexicans has been done away with; the cars are run up to the wells and the slag drawn off into them; they are then run out to a siding and dumped into larger cars and the slag is hauled to the dump by the donkey engine. Until the arrival of the electric motor, these cars will be drawn by hand; the wires, etc., have all been fixed for the motor, and when it arrives the trolley system will be put in working order. The Copper Queen Co. produces pig copper 99.2 per cent fine at a less cost per cent per pound than any company in the Territory. The output of the mine for the past year exceeded that of '97 by over 8,000,000 lbs., the output in '97 being 25,953,521 lbs., while that of '98 was 34,000,000 lbs.

CALIFORNIA.

Amador.

In Volcano district, the Douglas shaft is down 400 feet; they are engaged in drifting and crosscutting, and the indications are promising. About twenty men are employed. The company has expended in the neighborhood of $30,000 in development work.——At the South Eureka, near Jackson, they have a drift 300 feet on the 1600-foot level, and while occasional bunches of vein matter are encountered, the main ore body will not be reached inside of 500 feet. The 20-stamp mill is crushing steadily.

At the Kennedy the repairs to the north shaft have been completed and work has been resumed. The south shaft is undergoing repairs. At the new shaft the boiler is in place and the engine will soon be ready for operating.

Sutter Creek *Record*: Rich ore has been encountered on the 210-foot level in the Potazuba mine near Sutter Creek.——Sinking was suspended at the Oneida mine the first of the month, and they are now crosscutting to the ledge on the 1700-foot level. It is expected that a big mill will be erected on this mine this year.——At the Central Eureka the water is out to the 900 level. The shaft is in excellent shape, and there will be no delay in driving development.——At the Lincoln work is going ahead. The crushing made from this mine recently proved to the satisfaction of the stockholders that they have a good mine. Next summer a big mill will be in operation at this mine.

Jackson *Ledger*: Developing at the Zeila it progressing. Drifting is in progress from a new station at 1085 feet depth; a station is being cut at 1360 feet and sinking is progressing.——After a shut-down of a month for repairs, the Amador Queen No. 1 operations were resumed last week ——At Drytown, the new 10-stamp mill at the Pocahontas mine is running steadily on good rock.

Jackson *Republican*: In the Bluebell mine, near Jackson, a vein 18 inches wide has been uncovered. The rock is claimed to be high grade.——It is said that work will resume at the Hazel Dell mine.

Butte.

The shaft in the Magalia mine is 5000 feet deep and the tunnels run 4000 feet from the foot of the shaft.

Oroville *Mercury*: Litigation in which the Cherokee mine bondholders have been engaged for years is at an end. The Lady Alice G. M. Co., for some months the only adverse claimant, has quitclaimed all interest in favor of T. Z. Blakeman of San Francisco, representing the bondholders. Several months ago the bondholders gave C. W. Cross and others, composing the Lady Alice G. M. Co., in consideration of their claim to a portion of the property, an option on the same for six months, the understanding being that if a sale was not made within that time the Lady Alice Co. would withdraw all claims to the mine. This time expired several weeks ago, but as the holders of the bond for sale represented that they had a sale practically made, a postponement was granted. The time again expired, and no money having been paid by any prospective purchasers, the mine reverts to the bondholders, according to agreement, and deeds are drawn in fulfillment of its provisions.

Calaveras.

San Andreas *Citizen*: The mill in Angels Camp is dropping its full number of stamps. There is now enough water in the reservoirs to keep the mines running at full capacity until early fall. In all probability the mines of Angels will not close down again this year.——Kane & Garnett have bonded the Big Four quartz mine at Fourth Crossing.——A new shaft is being sunk on the property of the Fort Wayne G. P. Co. near San Andreas.——Crosscutting has been commenced on the 300-foot level in the Demarest mine near Fourth Crossing.——The foundation for the 10-stamp mill at the Ford mine is nearly completed.

El Dorado.

(Special Correspondence).—Davis & Farmer, in the old Argonaut mine, near Georgetown, on which work was resumed some months ago, continue taking out high grade ore. The ledge is from 20 to 30 feet wide, and the rich seam is from 2 to 10 inches in width. The property is owned by J. Smith of Greenwood.

The Gopher-Boulder property, at Kelsey, is again in operation. The 20-stamp mill and concentrators are run by electricity.

Garden Valley, Jan. 16th, '99.

Placerville *Democrat*: At the Atlantic mine near Placerville, in which the recent strike was made, they are still in good ore.——The Tockey gravel mill is dropping ten stamps. Taylor & Clifton are working the property on percentage.

Kern.

Randsburg *Miner*: The Johannesburg Reduction Works recently crushed fifty tons of ore for the Wedge Co. which yielded $40 a ton; seventy-five tons for the Big Butte, worth $75 per ton; one hundred tons for the Windy, $60 a ton; fifteen tons for the Minnehaha, which went $25 a ton.——The Eureka mill crushed thirty tons for the Wedge Co. recently which went $100 per ton.

Los Angeles *Review*: Considerable ore from the Randsburg district is being shipped to Barstow.——Excavation at the Blackhawk mine has been concluded and everything is in readiness for the mill, which will be in operation soon. Water for running the mill will be furnished by the Squaw Springs Water Co., conducted three miles.——The Quinn & Pridham mill has completed a run of twenty-nine tons on Wedge ore, yielding over $3000.——The December cleanup at the Yellow Aster mines, Randsburg, was about $60,000.

Madera.

(Special Correspondence.)—Wm. Brown has sold his quartz claim on Fine Gold creek near the San Joaquin river. The purchasers have a 2-stamp mill on the way, which is to be put upon the property. The ledge is 4 feet wide and goes $6 per ton.

In the Starbuck, owned by O. N. Williams, the shaft shows a 12-inch vein which mills well in free gold besides a good percentage of sulphurets.

The Mud Springs mill runs constantly, enough ore being in sight to last for three years with the present crushing facilities.

Gold, Jan. 17th, '99.

Mariposa.

(Special Correspondence.)—There is a steady output of bullion from the Whitlock mine, under the management of Wm. Johns, and the Mt. Gaines mine at Hornitos, under the management of Mr. Johnson. They are now erecting poles to bring electric power from the Merced falls to the mine, which will reduce expenses, wood being $5 per cord. The Doss mine, we learn, has again started up, with the addition by purchase of the Thorn mine, adjoining. The Thorn has been noted as a rich ore producer. The No. 9, the Quartz Mountain, the Root and Old Washington are bonded.

Hornitos, Jan. 16th, '98.

(Special Correspondence). — The Porter Ranche and Keystone mines were sold by order of Probate Court at Mariposa last week to Galey & Co., who are operating the Murphy mine, adjoining the Mary Harrison. The purchase price was $10,000. The property comprises 240 acres under agricultural patent, including one mile of the west vein just south of the Malvina and Tyro properties. A 6-stamp mill is being erected on the property.

The Golden Crown Co. has postponed the erection of its mill until spring.

Tuolumne parties have bonded a group of claims from Spencer, McLennan & Adams for $8000, part of which sum has been paid. The claims are on the north fork of the Merced.

The Columbus M. Co. is taking out some very good ore from its claims on Horseshoe Bend mountain.

The Louisiana mill is again running at its full capacity.

The Bean Creek M. Co. has been incorporated in San Francisco to operate the Kohler-Hill mines just west of the old Red Cloud, and owned by Dr. J. O. B. Gunn of San Francisco.

Coulterville, Jan. 16th, '99.

Nevada.

A. M. Gray has a force at work running a tunnel in the Mack mine near Nevada City. In former years this ledge produced high-grade ore, but until now there has been no systematic effort to go down on it.——Hydraulicking began at the Gray & Bullard mine near Nevada City this week.——Water power will be used at the Texas mine Feb. 1st. The new mill will also be ready to start by that time. Drifts and crosscuts are being run from the 250-foot level.

Grass Valley *Union*: The New York corporation under the management of C. R. Corning has relinquished the option it had on the Orleans mining property near Grass Valley. The old company has resumed operations and are unwatering the mine.——Part of the machinery for the new mill being erected by the Pennsylvania M. Co. will soon be placed in position. The recent storms have delayed work, and it will be a few weeks before the mill is in working order.——The W. Y. O. D. mine and other properties, formerly owned by the W. Y. O. D. Co., has passed to the Grass Valley Exploration Co. The Board of Directors are J. & J. Weissbein, and J. K. Nuttall, L. B. Parrott and W. S. Keyes of San Francisco. The W. Y. O. D. employs sixty men on day's pay.——The Cherokee & Badger Hill M. Co. have applied to the Debris Commission for permission to work their mine near Nevada City.——R. Noell has begun suit to foreclose a mechanics' lien on the Golden Gate mine, near Grass Valley. The defendants are the Rocklin M. Co. of San Francisco.

Placer.

Minnesota people are said to be negotiating for the Crandall mine, in Ophir district.

Auburn *Herald*: The Mayflower M. Co. near Forest Hill has bought all the claims between its ground and Smith's Point. At an early date mining on the upper lead of the Mayflower will begin. This lead carries a fine grade of gold, selling for nearly $20 an ounce.

Auburn *Herald*: Stevenson & Whitacre are developing a good milling ledge near Auburn. They have sunk a shaft on the ledge in which the ore shows good prospects. They are running a tunnel on the ledge to drain and work the mine. If the tunnel develops as good rock as the shaft they will put up a small mill.

Riverside.

The Gavilan mine made a big shipment of gold after a twenty days' run on high-grade ore. The mine is employing twenty men and good ore is found on the 200 and 300 levels.

San Bernardino.

(Special Correspondence). — In performing assessment work in December on the San Bernardino iron mines, indications of a body of copper ore underlying the iron were frequently visible. These mines are now under ninety days' bond to Pittsburg, Pa., interests.

The Peacock copper mines, near Lavic, are being worked, and some high grade ore is being shipped.

The Pacific Coast Borax Co. is working a force at its mines, conveying the ore by its narrow-gauge railroad to the company's calcining works, between the mines and Daggett, on the Santa Fe Pacific. After calcining, the ore is shipped East.

The Waterloo mills, near Daggett, are now going on their sixth year of idleness, owing to the decline of silver; the plant cost $240,000.

The plant of the new borax company at Daggett has closed down till warmer weather.

San Diego, June 16th, '99.

San Diego.

(Special Correspondence). — The cyanide plant at the Stonewall mine is ready for work.

The sale of the Noble Bros.' mine in Pine valley recently reported at $30,000 was premature. The buyer announced himself ready to close the deal, when the Noble Bros. declined to sell at the price previously agreed upon, they in the meantime having encountered a body of rich ore.

Near Barrett's dam a big ledge of iron ore was discovered the past week. Near the same point galena ore has recently been discovered.

An option has been given English people on some of the Laguna property for $50,000.

A vein of free milling gold quartz was discovered two weeks ago near Banner.

Near Descanso G. W. Marsh and others found a vein of valuable gold ore.

The establishment of a large blast furnace plant by a Pittsburg party for the reduction of the Tepustete iron ores of Lower California is talked of.

San Diego, Jan. 16th, '99.

H. Johnson of Socorro brought to San Diego last week three pieces of gold amalgam weighing fifty ounces each, the whole worth $2500. He has fifty-two claims there, water being brought in a ditch eighteen miles.

Shasta.

The Mountain Copper Co. will build a foundry at their smelting works at Keswick.

O'Shay & Co. have taken a long lease on the Milkmaid quartz mine, near French Gulch. This is the property which Senator Jones of Nevada and his associates bought less than two years ago from J. Souter for $20,000, and on which they placed a mill. It has generally been credited with having paid for itself and equipment and leaving a small margin.

Siskiyou.

The Gum Boot quartz mine of Scott river is locally reported to have been secured by D. H. Moffatt of Denver, Colo., who is said to be making arrangements to work it on an extensive scale.

Yreka *Journal*: Work is progressing at the Commodore mine, near Yreka, both in getting out quartz and crushing.——W. N. Wilbur left last week to open up the Yellow Jacket quartz mine, on Barkhouse creek.——The Greenhorn Blue Gravel mine, is gaining a better supply of water since the late rain, and the returns from cleanups will be considerable more. Instead of wholly depending on pumping up bedrock water for sluicing, the company will now get a large quantity of water in the creek.——At Hawkinsville, the miners will have an opportunity of working their claims with success, as the free water supply is good this season.——The Spengler Bros., since the late storms, will begin work in their hydraulic claim soon.——The Jillson Roberts quartz mine at Henley is worked day and night.

Tuolumne.

Trouble is said to exist at the Rawhide mine over the control of the property. Ballard & Martin of San Francisco, who own two-thirds interest, have been at the mine for some days and, it is locally reported, have placed S. Sprout in charge of the property, to supercede W. H. Nevills in the management of affairs. The latter owns a third interest and has held the management of the property for nearly ten years. It is said that adverse legal proceedings will be instituted by him.——At the Santa Ysabel mine, near Quartz, the mill was started up on the 2nd inst. with plenty of water. The company has a large supply of ore on hand. No. 1 shaft is down within 39 feet of the 600-foot level. When the 600-foot depth has been reached drifting will be started north and south. No. 5 level is being driven to cut the Central ore chute.

Jamestown *Magnet*: The Rawhide mill was started up last week. The force at the Rawhide will be increased soon; 100 men will be put on.——At the Jumper mine at Stent an additional twenty stamps will be put in.——Operations at the App mine were resumed last week and the mill began dropping its stamps. It is expected that electric power will be used soon.——In the Longfellow mine at Big Oak Flat, at 280 feet, they struck a body of high-grade ore recently.——A strike of a good body of ore is reported in the Golden Rule mine at Stent.——At the Confidence mine they are sinking a winze from the bottom level. It is down 275 feet. The canvas plant, which began operations two weeks ago, is working with satisfactory results.

Sonora *Independent*: At the Bonanza mine, near Sonora, the water pipes are being repaired preliminary to reopening the mine.——The main tunnel of the Fox mine at Sawmill Flat has been retimbered and put in good order.——The Hudson & Calhoun mine is being worked and the chute which had been lost was found last week.——The Excelsior mine, in the Sugar Pine district, is being developed by the Standard G. M. & D. Co. of Bodie.——The O'Hara & Elsbree mine, Brown's Flat, is yielding specimens of gold averaging from a few ounces to a piece of solid gold weighing twenty-two ounces.——The Street mine at Tuttletown was started up this month. Twelve men are at work. There is a six-stamp mill on the property.——The Bown mine is working full capacity and has been for some time past. Grading is in progress for a

mill. A large force is employed.——It is locally reported that the Marryatt mine will resume operations.

Sonora *Democrat*: The Black Oak mine is running steadily under steam. In the mine they are stoping from the 800 level.——The Columbia Gravel & Expl. Co. discontinued the original boring at a depth of 220 feet, owing to the chipping of the hole's rim, after which the pipe could be driven no deeper. Forty feet of pay gravel had been passed, though bedrock was never reached. A new boring was started and is down over 60 feet.——Some good ore has been opened in the Standard, near Columbia, in a 6-foot vein. The Standard looks well, and, if developments result as satisfactory as those already made, the property will be equipped with a mill.

COLORADO.

BOULDER COUNTY.

The Puzzler mine, near Ward, has been started up by A. E & F. W. Hawes of Boston.——F. M. Leach recently bought for Pittsburg, Pa., people the Boulder County mine, near Cardinal, and a large tract of land adjacent to it. The deal also includes the Midget concentrating mill at Nederland, a plant of twenty-five stamps, the construction of which has recently been completed. The price was $250,000. The property has a tunnel and two shafts. Drifts aggregating 1000 feet are driven on the vein. A recent mill run on 300 tons of ore from the mine gave values of $16 a ton in gold. The mine was recently retimbered and is in good condition for further development. Mr. Leach's plans contemplate the construction of extensive tramways from prominent mines near Nederland to connect with the mill.

Boulder *News*: A strike has been made in the Village Belle mine at Boulder. The vein is from 3 to 5 feet wide with a streak of sylvanite ore from 1 to 3 inches wide that assays high in gold.——In the Helene W. on Mineral mountain a 3-foot vein of tellurium ore was broken into last week.——The Somerset has opened an ore body containing 9 feet of smelting ore.——The Mogul tunnel is in 850 feet whence one branch will be run to cut the Gold Coin, Virginia, Village Bell and Enterprise while the left branch will cut the Clara, Terror, Bonanza, B. & M. and Goldstone. All of these properties will be cut at a depth of 900 feet.——In the Maud W. a vein was opened that is over 6 feet wide and contains a 10-inch streak of tellurium and sylvanite ore.

CLEAR CREEK COUNTY.

Georgetown *Courier*: The Aliunda mine at Georgetown shipped seven tons of ore last week from the new strike in the 850 level. The ore is of good grade, milling 408 ounces in silver per ton and 12½ per cent lead.——Holbrook & Tipple opened up a streak of solid ore on the New Boston. They have been running on a 5-foot streak of concentrating ore that carries from 10 to 15 per cent lead.

Idaho Springs *Gazette*: The Anchor group, at Freeland, has become a steady shipper. The owners and ten leasers are working and all doing well. The last two shipments averaged $32 per ton.——The Diamond, at Freeland, produced last month some ore running $400 per ton.——Winters & Co. are making shipments of ore from the Bismarck that runs from 240 to 250 ounces of silver per ton.——J. Buxton is shipping 400-ounce ore from the Snow Drift mine, near Georgetown.

The Griffith mine is a heavy shipper, and all of the leasers are taking out pay ore. This mine was idle for years, but after the present management expended a few thousand dollars in opening up new ground, miners are paying as high as 75 per cent royalty.

EAGLE COUNTY.

Red Cliff *Times*: The Iron Mask mine, near Red Cliff, has shipped four cars of ore this month.——Arrangements have been completed for the starting up of the Raymond, under lease to Houston & Stonebraker. The mine has been idle a number of years. Work started this week.

EL PASO COUNTY.

The Independence mine at Victor, owned by W. A. Stratton, made a gross output since 1893 of $4,000,000, with a net profit of $2,000,000. The depth of the three-compartment shaft is 900 feet; length of drift, 29,711; length of winze and upraise, 2160. The Independence group contains 150 acres and much of the ground still remains unprospected. The hoisting plant consists of two 300 H. P. engines and a smaller hoist for the use of workmen timbering the shaft. Two air compressors furnish power for the drills and a private electrical plant thoroughly illuminates the buildings and workings of the mine. The pumping station at the 900 level is capable, under pressure, of raising 2000 gallons of water per minute, and at the 600-foot level there is a plant that can handle 900 gallons a minute.——The Hull City mine at Cripple Creek has paid the owners $700,000 in royalties and Jan. 1st reverted to the owners, a big mine.——A 20-ton shipment of ore graded from two to four ounces was sent from the Lafayette mine at Victor. Work began last week sinking another 100 feet. The shaft is down 600 feet.——F. Saunders, lessee on the Silver Tip, made a shipment of ore which gave values of $173 a ton and the second-class ore $73 a ton.——From its own shaft the Vindicator is producing over fifty tons a day and lessees are producing an additional fifty tons a day. There are seven shafts on the property from which pay ore is being shipped.——Du Bois & Carnell, operating the Wallace lease on the Vindicator, shipped last week one carload of screenings worth $40 a ton, and also a carload of mineral that will run five ounces a ton.——The Porcupine shipped one lot of five tons vanued at $473 per ton, another of 242 pounds valued at $326.40 per ton.——The Orpha May shipped one lot of 531 pounds valued at $763.20 per ton, another lot of five and one-half tons valued at $64.40 a ton.——The annual report of the Gold Coin Co. shows that the mine during the past year produced 31,833 tons and 430 pounds, with a gross value of $1,051,149.20. There was paid out $313,000 for freight and treatment charges and $130,000 in dividends. The cash on hand amounted to $336,000.——The Last Dollar was started up last week with fifty men. In about thirty days a larger force will be employed.——The C. C. & C. C. M. & L. Co. shipped about $6000 worth of ore during December.

The Pinto Leasing Co., at Victor, will maintain its production at 120 tons daily until the expiration of the lease in February.——Three carloads of ore were marketed from the Hoskins & Johnson lease on the Vindicator Co. this week, estimated to return $30 to $40 a ton.——The lessees on the Whisper shaft of the Gold Sovereign are working twenty-two men and are producing ten tons daily of an average grade of two ounces. At a depth of 175 feet a new vein 18 inches wide has been encountered that is all pay.——Another shipment of ore was sent from the Isabella mine last week. It consisted of fifty tons and is the richest that the Isabella has yet shipped, and will exceed the $65,000 which was the value of the preceding shipment.——The Simmons & Co. lease on the Zenobia marketed fifty tons of two-ounce ore last week and have another high-grade shipment ready for the smelters.——The new shaft on the Jack Pot, being sunk by the Creston Leasing Co., broke into the vein at a depth of 309 feet last week. The lease is employing ninety men this week, and expect to have fifty more miners on its payroll. Estimates have been asked for furnishing the mine with machine drills.——Daily shipments are made from the Abe Lincoln. The ore is marketed in two grades. Screenings carry about an ounce. Coarse rock has been averaging 1½ ounces.

The Finn Leasing Co. last week shipped from the Morning Glory No. 2 fifteen tons of ore estimated to run from five to eight ounces. The rich ore is coming from the 350-foot level where the vein is 2 feet.——The Elden Leasing Co. on the Republic will soon start heavy shipments of good average grade mineral. In the 900-foot level stoping has been started on a 2-foot vein of three-ounce ore, while on the 250-foot level a drift is being run on the vein, with 10 inches of ore, good for ten ounces.——Block 2 of the Vindicator, under lease, marketed a carload of two ounce ore receatly.——Hobbs, Morse & Co., leasing on the Wisconsin, made a shipment this week on which values run $300 a ton.

The first shipment since the big improvement made at the Lillie mine, Cripple Creek, went out last week. In consisted of fifty tons and there is between 300 and 400 tons yet in the bins.

The Wild Horse mine, at Victor, is shipping about twenty-five tons daily.

GILPIN COUNTY.

The Lotus mine near Central City is shipping 300 tons of ore to the Newton mill at Idaho Springs. Shipments of smelting ore were also made last week.

GUNNISON COUNTY.

The Bull Domingo group of mining claims, near Gunnison, was purchased last week by S. I. Hallett of Aspen for $50,000, of which $5000 was cash.

LAKE COUNTY.

The Catalpa M. Co., Leadville, is making heavy shipments of steel iron ore to South Chicago. The shaft is being sunk with two shifts while ore is being hoisted from the stopes eight hours a day.

The Silver M. Co. on their extensive sulphide mines near Leadville, worked through the Moyer shaft, announce definitely that the unwatering is entirely completed. At present the Gordon & Maxwell station pump is required to handle only 300 gallons of water per minute. The payroll carries ninety names and the average daily output is close to 150 tons. Considerable development is under way which has proven up large ore reserves of iron as well as zinc-lead sulphides. The gold values in this ore carry from one-fourth to one-half ounce in gold. The unwatering of the extensive workings in this combination has been done at the cost of $20,000.

MINERAL COUNTY.

Last week the ore shipments from Creede were 145 cars—2381 tons.

PARK COUNTY.

At Fairplay the Peerless Maud mine is producing silver-lead ore that averages $41 a ton.

ROUTT COUNTY.

At Columbine an English company known as the Golden Eagle Syndicate has leased a group of fifteen claims and development work is being done on two claims.——The Elkhorn, at Whisky Park, has lately started taking out ore which they are freighting to Rawlins, Wyoming, shipping thence by rail to Denver.

SAN JUAN COUNTY.

The output from the Upper Aspen mine, at Silverton, is four carloads a month.——The Shenandoah is still shipping a carload of high grade ore every ten days.

SAN MIGUEL COUNTY.

At Saw Pit the Nancy Hanks is shipping four to five cars a week to the smelters.

San Miguel *Examiner*: In the Smuggler-Union mill at Telluride a continuous record of 200 tons a day will be achieved throughout the year. It is given out that the gold strike made last summer in the mine brought the company $300,000. According to the estimated amount at the time, 3000 pounds, this shows that the ore brought $100 a pound.——Owing to the large amount of ore accumulated in the drifts at the Silver Pick that mine has been compelled to lessen its working force by twenty-five men. The mill had to be closed about the first of December on account of the scarcity of water and it will be impossible to put it in operation again until spring. About forty carloads of the best ore have been shipped to smelters since that time, but as the cost of transportation is large it is only a high grade ore that will stand shipment, consequently the ore has accumulated at the mine to an extent to almost stop production. The greatest problem the company has confronting it is milling capacity, and an addition to the mill is being planned.

SUMMIT COUNTY.

At Frisco the Victoria mine is mining four cars of gold ore a week.

IDAHO.

The Twin Sisters mine, near Centerville, has been secured by Pittsburg people interested in the Trade Dollar at Silver City. The new management is working a number of men. It is the intention to explore the property during the winter, and if it proves as good as it now indicates, a large mill will be erected. There is a 5-stamp mill on the property.

Three lots of ore from the Cœsus mine near Hailey, weighing 2000 pounds, were shipped to Boston, to the Massachusetts Institute of Technology, to be analyzed and tested by the various processes of reduction as adapted to that class of ores, upon the result of which depends the erection of a reduction plant.

The ledge on the Big Buffalo is said to be 40 feet wide and 30 feet of it will average $30 per ton, while 10 feet will go $60. A mill test of the ore taken from a 10-foot hole sunk about the center of the ledge made at the Banner mill in Florence plated $20 per ton in gold. The concentrates were shipped to Tacoma and the return was $2747 in gold and sixty ounces silver per ton.——At Murray seventeen property transfers were placed on the county records last week. Of these six were for the nominal consideration of $1 each, but the total of the seventeen was $16,625.87. The Cœur d'Alenes are so well covered with old surface locations that there has been little room for the tunnel site man to get in his work, and claims of that nature are seldom recorded.——R. H. Britt, Mgr. Poorman mine at Silver City, says the outlook for the Poorman is brighter than it has been for years, and will soon again be a steady producer. The mine has been thoroughly developed. At a depth of 900 feet, 250 feet below the old workings, a vein 4 to 5 feet wide was encountered. From this 450 tons of high-grade free milling ore was extracted and milled last year while the development proceeded.

Near Gibbonsville, leasers on one of the claims of the A. D. and M. group, after doing several months' dead work crosscutting and drifting for a lost ore chute that had been cut by a fault, cut into the ore body last week and made a good strike. The ore was 3 feet thick.——The Springfield Gold & Copper M. Co., at Wallace, let a contract last week to run a tunnel 200 feet on their Stevens Peak property.

MONTANA.

The strike at the converters in Anaconda has been declared off, the strikers giving up the fight as hopeless. About 300 men are out of employment with no chance of getting back. The converters are running full blast again. Applications for work have come thick and fast—about five men for every job.

The Hope shaft at Basin has reached a depth of 40 feet below the 500 level.

It now seems certain that all grades of ore can be profitably worked in the Mussigbrod mill at Garnet and the probabilities are that the mill will be enlarged and run on custom ore.——The water has been pumped out of the Martha W. mine at Winston and eight men are developing it.——The Bear Gulch M. Co., near Livingston, is pushing the work of placing their new turbine wheels, and soon the company's 20-stamp mill will be in operation.

Philipsburg *Call*: It is locally reported that additional men will be put to work in the Bimetallic mine, near Granite, on the 15th inst., and information from a reliable source is at hand that a general resumption of the Granite and Bimetallic mines will occur about that time. The Bimetallic mill will be run to its full capacity and the present force of miners doubled. Both mines will be turning out ore and bullion shipments will again be resumed. The tunnel connecting the Granite mine with the Bimetallic at the 1400-foot level is nearly completed, and as soon as the water is pumped from the Granite to that depth the connection will be made. Both mines will be operated, and the ore is to be hoisted through the Bimetallic shaft. It is stated that there will be no cessation of operations as long as the ore bodies in the mines hold out.

Clancy *Miner*: In Montana mines—copper, gold and silver—the highest grade of activity was manifested in '98. At the close of '97 nearly all of the mines in which silver is the major value were closed down. No additional mines closed during the year, and some have again begun operations. Nearly all of the silver produced was a by-product of either copper or lead, while much of the gold was likewise a by-product of the copper.——In the 250-foot level of the B. & G. mine, in addition to the ore of a shipping character, there are quantities of good concentrating ore—about 4 into 1. This may lead to the building of a concentrator of 100 tons daily capacity. The output of the B. & G. is treated at the East Helena smelter, where they have obtained a rate on the basis of $10 per ton.——The Mocking Bird mine has disclosed a vein of from 4 to 15 feet in width. Only the rich pay streaks in the vein matter are sorted and shipped.——The shaft on the Madisonian mine of Madison county, of which J. H. Conrad of Salt Lake City is the principal owner, is to be put to a depth of 300 feet.

NEVADA.

The Dexter of Tuscarora shipped last week a gold bar that weighed in at $3000. Recently the full battery of forty stamps began dropping and the next cleanup will be of greater value.

At the Con. Cal. & Virginia, the Comstock Pumping Association, worked in the C. & C. shaft the past week. The hydraulic pipe of the old rope-transmission system has been secured from the surface to the 1500 station. A station below the 1650 level has been cleaned out and a tank is about to be placed in position to receive all the water that has been caught up at different points in the mine, and conveyed through pipes and boxes to the Sutro tunnel drain from the 1650 level. The tank will be substituted for the boxes on the level and iron pipes for a wooden box that is now in the shaft. The 1750 station is being remodeled. Heavy foundations are being provided to receive the 1500 feet of hydraulic pipe that is now on the ground, to form part of the pumping system about to be installed by the Risdon Iron & Locomotive Works.

The railroad from the Adelaide copper mines in Humboldt county to the reduction works at Golconda is completed.——A good strike has been made in No. 3 tunnel on the Murphy-Curieux group of mines in Bull Run basin, Elko county. The ledge is 4 feet in width.

J. A. Blossom has been shipping several carloads of high-grade ore to Salt Lake City from his Kennedy group of gold mines in Humboldt county.——The Glasgow & Western Co. is placing a steam hoist plant at their mine near Battle Mountain.

The Wells *Herald* hears that the Glasgow Co. during '99 will build a railroad from Wells to Cherry Creek.

Austin *Reveille*: J. Johnston has leased the Wilson mine in Galena canyon and put men at work extricating ore.——J. Mellendar of Galena is making a carload to be shipped to Salt Lake.——The Glasgow & Western Expl. Co., which operates the Mammoth Adelaide copper mines near Golconda, are also interested at Copper canyon, near Battle mountain. A large hoisting engine has been placed and the number of miners will be increased.——W. H. Dean in his mines at Dean intends starting the Burleigh drills the 15th inst.——J. A. Blossom has been shipping several carloads of high-grade ore to Salt Lake City from his Kennedy group of mines.

Carson *Appeal*: Senator Wasson and J. Chatovich have returned from New York, where they have been in the interests of the Silver Peak M. Co., operating in Esmeralda county. The company has finished litigation over mineral ground, mill sites and water claims and won the case. Wasson has been Supt. of the mines for a number of years, and some time ago ran a tunnel into the big ledge, uncovering a large ore body. As soon as the company heard of the strike, the mine was taken off the market and will be operated by the company.

NEW MEXICO.

The output of the mines of Hillsboro for '98 was 10,840 tons of ore, which produced 17,361 ounces of gold, 52,858 ounces of silver and 117 tons of copper. The total value was $404,916. The average value of the ore is estimated at $34.86 per ton. The increase in the output of ore is 1500 tons above that of '97.——The net profits of the Snake group, owned by H. M. Porter of Denver were $37,000.——Sinking was begun on the Thayer shaft near Pinos Altos last week. It is now 500 feet and it is to be sunk 100 feet more and drifts are to be run north and south on the vein.

Santa Fe *New Mexican*: The Confidence M. Co. of Elizabethtown are increasing the mill's capacity to fifty tons daily.——The Blue Bandana shaft near Elizabethtown is down over 200 feet and in good quartz.——At Socorro a 150-ton concentration plant for the Timber Peak Co. is being built. The mill will be ready in three weeks.——At Pinos Altos the Hearst estate is increasing its local mining capacity to 200 tons per day.——R. C. Wilson of Cripple Creek and Teller of Denver, with Chicago capitalists, have secured a bond on the new Aztec discovery and will operate the same. The discovery is a 12-foot vein carrying $12 to $60 ore in gold. Twenty stamps are already at work on the ore and twenty more will be started soon.——Baron Van Zulen sold one of his Aztec properties to Colorado people for $10,000, one-half being cash.——The New Moon mine at Elizabethtown yields $60 per ton in gold and $2.20 in silver from a 3-foot vein.——Since the La Huerta grant, located in Santa Fe and Bernalillo counties, has been thrown open to the public mining operations have begun there, and ore is being hauled nine miles and then carried thirty miles by rail to the smelter.

OREGON.

Near Hillsboro, while ditching on his beaver dam, G. Robinson struck a gold-bearing quartz ledge, which assays $42 to the ton. The ledge is between 2 and 3 feet in width.

The concentrates and ore shipped from Sumpter to Baker City for December were 387,493 pounds, and the shipments for the six months ending Dec. 31st, '98, were 2,840,957 pounds.

Baker City *Democrat*: On the Deer Lodge mine, near Baker City, recently purchased by the Rock Springs M. Co., a large mill plant will be erected the coming season.——The May Queen mine will erect a mill plant at once.——In the Collateral mine the upraise is nearing the surface, and, when completed, a large force will be employed and the Virtue mine started for a long run.——A 10-stamp mill is being built on the Prairie Diggings mine, near Canyon City.——A single blast in the Bonanza mine last week, at a depth of 500 feet, through eight holes made with Burleigh drills, brought down about thirty tons of ore and waste. Twenty tons of this ore contained $63,000 worth of gold, almost all of which was free gold. The ledge in this place is 3 feet wide, and the value of the ore knocked down in a single shot is said to be the biggest ever recorded in Oregon.

Baker City *Republican*: The Virtue Con. mines last week shipped $8500 from a recent cleanup.

Jacksonville *Times*: Piping was resumed at the Sterling mine, near Jacksonville, last week, with a good supply of water.——The Black Channel mine, in Foots creek district, is being operated by M. Lee, who has leased the property.——Kitchen & Huggins have leased the Miller mine, in Farmer's Flat dis-

trict, and have everything in readiness for a big run.——At the Shorty Hope mine, in Wagner creek district, operations on a large scale have begun.——Beekman & Huffer have put a small force to work in Shively gulch district.——Near Roseburg, thirty-five men are employed at the Gold Bug mine, in Mt. Reuben district, and a twelve-days' run with a 5-stamp mill produced $3700. —J. Behrman, Mgr. Black Butte Quicksilver M. Co., in Lane county, says that statements that the mine has shipped $90,000 worth of quicksilver are misleading. They are getting the mine into shape. The sum of $75,000 has been expended on roads, bridges and other improvements. Next spring the mine will begin shipping.

Grant's Pass *Journal*: The Black channel mine near Grant's Pass has a force of men getting ready for the winter work.——F. R. Wardle has a force at work on the Houston property, which his company recently bought. ——The Eureka mine has plenty of water, good rock, and mill and concentrator at work day and night. —J. D. McMahon and some Portland people have bought the Bliss mine near Gold Hill, named it the St. Lawrence, and have begun work.

SOUTH DAKOTA.

The Crown Hill M. Co. at Crown Hill has an ore vein 4 feet wide at the 100-foot level, and at the 150 level it fills the shaft. The ore carries an average of 30 per cent lead and fifteen ounces of silver. Streaks are occasionally found where the ore will run forty ounces of silver and 50 and 60 per cent lead. The company has been shipping ore for some time; a carload was shipped last week. The company has also been concentrating ore. It is concentrated to five to one and then carries values of $60 a ton.

UTAH.

At the Four Aces mine at Silver City raising of high-grade silver and lead ore has resumed. The new machinery is working well and in a short time the output will increase to a carload a day.——The Sunshine mine at Sunshine has found new ore in new workings.——Another shipment of gold dust was made this week from the Golden Gate at Mercur.——The saltpeter company, owner of the saltpeter deposits near Salt Lake City, has decided to put its material into commercial form.

Last week's shipments from Tintic were seventy-one cars of ore and four bars of bullion.——The sinking of the shaft on the Swansea at Silver City to a depth of 950 feet will be pushed; the lowest level at present is 750 feet.——The Red Wing of Bingham shipped recently two carloads of concentrates and a consignment of crude ore. The latter yielded 4 per cent copper, 48 per cent lead, 20 ounces silver and $1 gold.——At Lehi W. F. Butts has tied up the Sir Victor group on an option for $50,000 for eighteen months.——The South Daisy, West Dip, will begin the erection of a mill as soon as the weather is settled. The vein has been extensively prospected and assays show a satisfactory milling average.——The Massachusetts M. Co. at Park City will sink a new shaft as soon as the snow is gone. In the meantime developments will continue in the old workings, where there is a streak of 18 inches that goes 63 per cent lead, 14 ounces silver and $1 65 in gold.——On the property of the Bingham Copper & Gold M. Co. at Bingham the force will be increased as rapidly as room is made for it.

The Ajax at Mammoth made a strike in the 600-foot level that shows 17½ per cent copper in addition to silver and some gold. In the meantime another lot of high-grade copper and gold ore is being raised and exploratory work is being prospected.

At Price the first of the teams arrived last week with copper ore from the Dyer mine near Vernal. About sixty teams are on the road with ore from the Dyer mine, and about three carloads will be loaded from this property each month. Considerable gilsonite will be brought in the coming month.——In the Old Jordon & Galena at Bingham has been found a wall of galena 35 feet in length; assays show an average of 40 per cent lead, fifteen ounces silver and $3 in gold; its value is appoximated at $250,000.——Returns from the recent shipment of Geyser-Marion gold dust show a valuation of $8300.— At Bingham will be built a large concentrator for use of the Highland Boy and Boston Con. M. Companies. In the development of the "smelting classes" in these properties is exposed a volume of milling ore containing gold, copper and silver. Experiments have satisfied the management that these ores may be more marketed in the form of a concentrate, showing 30 per cent in copper, $10 in gold and twenty ounces in silver.——In the Chloride Point mine at Mercur the disclosure of new ore bodies was made in eight different places in new ground, from which returns show thirteen ounces silver and $2 in gold to 327 ounces silver and $4 in gold. The chute shows 3 feet of mineral.

The Mercur *Mercury* is informed that the Geyser-Marion mine at Mercur will soon enlarge the mill to a capacity of 200 tons.——The new incline at the Mercur has reached a depth of about 200 feet and has cut the third ore vein. The ore carries good values. The Mercur made a last shipment of cyanides last week that consisted of 1600 pounds, the result of two weeks' run.——The Geyser-Marion annual report showed receipts of $131,295 88, representing the net proceeds of 37,315 tons of ore treated. The average saving was $3.51 per ton, the cost of mining $1.43, of milling 70 cents and the net profit $1.38. The company paid $33,000 in dividends during the year bringing the total up to $96,000. The mill is treating 150 tons per day.

Eureka *Miner*: The shaft in the Mollie Gibson at Eureka is going down in a 4-foot vein of silver ore of from seventeen to twenty-five ounces and also carries a small value in gold. The company accepted an offer from the Connecticut Reduction Works which will net them for this ore $10 per ton on the dump.——High-grade copper ore was encountered on the 600 level of the Ajax mine last week that will yield a shipping value of $60 a ton, nearly all of which is in copper.

Park *Record*: The shipments of ore from Park City last week were 1,469,730 pounds. ——In the Daly-West Co., all matters relating to the adjustment of the internal affairs of the company are said to have been straightened out and the opening of work should occur the next two weeks.

WASHINGTON.

(Special Correspondence). — Sonneman & Branscombe of Spokane, Wash., have just closed the sale of a fourth interest in the Cumberland mine, Silver City, Idaho, to S. E. Smith and associatss of Kenosha, Wis., for $50,000. The selling parties hold a bond on the Cumberland. It is the intention to erect a large combination mill on the property.

Spokane, Wash., Jan. 16th, '99.

The Republic Big Six is in 200 feet, the face being in porphyry, with seams of quartz They are making 3 feet per day.——The Blue Bird has run a surface cut 20 feet across the ledge, and obtained assays as high as $16.17. ——At the Republic the values hold out well. When the machinery is in place the mine will be run at full capacity.——A 300-foot tunnel is being run on the Caliph.——The Golden Lily tunnel is being pushed night and day.—— Work will be started immediately on the Anaconda.——The Golden Leaf tunnel is in 315 feet. Considerable quartz is coming in.

At Republic the Ben Hur struck a ledge that assays from $17.96 to $37.67.

At Boundary a contract has been let by the Red Top M. Co. to drive a tunnel 250 feet. Work will begin at once.——At Fish creek, galena and chloride ore have been found in the Gladstone group of claims. F. A. Heinze is interested in these claims.

Last Wednesday W. C. Butler of Everett gave a receiver's deed of all the property of the Pride of the Mountains and the Monte Cristo Mining Companies to J. B. Crooker, John D. Rockefeller's representative. The purchase price of the Pride of the Mountains as stated in the deed is $167,501.95, and the Monte Cristo Mining Co. $160,569 98.

At Republic the Lost Lode has been developed by a 300-foot tunnel that cuts the ledge at a depth of 102 feet. There is also a raise of 100 feet.——The First Thought has upward of 300 feet of tunnel. Work will be shortly resumed on it.——The Princess Maud tunnel is in 305 feet and there is a shaft down 102 feet. There is 5 feet of $35 ore in the bottom of the shaft.——The Republic mine continues to ship its high-grade ore. Work is progressing in the development of the property. The drift being run from the lowest tunnel toward the Jim Blaine end line is in 270 feet and shows ore averaging $45 across the face of the drift.

Near Republic, in the Lorna Doon claim in Cody Camp, the assay values run $10.80, $16 10 and $19. The ledge is 35 feet in width, so far as known. The entire ledge averages $8 per ton. It is free milling rock.——In the King Solomon and Daisy claims on Myers creek, on the reservation, a 2-foot vein of good ore has been struck.

Spokane *Electrician*: Capt. Buchanan, Mgr. Ferguson group of mines near Chelan, states that his company will run a tunnel this year, a mile in length. The Ferguson group comprises sixteen veins of silver, lead and copper bearing ores, which will be cut by the proposed tunnel.——Of the mines near Loomis, the Palmer Mountain has some 1400 feet of tunnel. The company is operating two power drills, and 125 feet per month is being made. Several ledges have been cut.——The Double Standard G. M. Co., near Northport, has again resumed work. The company has also secured the Minneapolis and Stockholm claims.——Near Chelan, development work is being pushed on the Eureka group of mines. Four ledges have been discovered on the Little Jim and Dolly claims, one of which is 18 feet wide.

WYOMING.

Near Rawlins an average of sixty tons—two carloads—a week of high-grade copper ore is being shipped from the Rudefeha mine. The returns from a car shipped recently were $1195. On this basis the weekly output of the mine exceeds $2000. This is not counting the low-grade ore being accumulated on the dump, which will not pay to ship under present conditions.——The Rocky Mountain C. & I. Co. turned out about 160,000 tons of coal in '98. The mines—Nos. 5 and 6—at Almy were operated 269 days with an average of 224 men.——At South Pass the new 10-stamp mill and concentrator at the Carissa mine have started. There is about $200,000 worth of ore on the dump and blocked out in the mine. The ore plates $40 a ton under free amalgamation treatment.——J. J. Merriam is developing his mines on Smith's gulch. He will move his mill from South Pass in the spring.

FOREIGN.

BRITISH COLUMBIA.

There were recorded in Victoria during '98 1505 mineral claims.

The custom house valuation of the minerals exported through the port of Kaslo during '98 amounted to $2,550,669. The tonnage is given as 32,038 tons.

At Rossland work at the Le Roi is being pushed to place it again among the list of shippers. The Center Star is in a similar position and the War Eagle will be sending out from 250 to 300 tons of ore daily after the first of February, when the new electrical machinery will be in operation. The Virginia is nearing the 500-foot level. The Iron Mask is meeting with success in the development of the ore body. The Coxey is producing good ore. The Giant is again being worked after a short shutdown and the Sunset No. 2 has opened a vein at a depth of 450 feet. The Mascot's new electric plant is in operation and the Iron Mask's will be in two weeks.

Near Nelson the Granite and Royal Canadian groups are being operated on a large scale by the Duncan syndicate. The Granite group consists of six claims. The development consists of a shaft 140 feet; 400 tons of ore averaging $37 a ton has been taken out while sinking the shaft. A drift has been driven 200 feet and shows a continuous body of ore, assays from which run from $60 to $100 to the ton. A second level at a depth of 130 feet has been started and a drill has been installed to sink the shaft. The Royal Canadian group consists of 130 acres in extent. From this property several hundred tons of ore averaging $27 to the ton have been taken out. There is no dead work to be done, neither will there be any necessity for hoisting or pumping for years. The ore on both properties is a free milling quartz and it is estimated that the concentrates will average from $75 to $90 a ton. Forty-five men are employed since April, but in the spring the force will probably be trebled.——The Jo Jo, Rossland, is producing good ore, assays returning $5 in gold and 4 93 per cent copper, a total value of $17 81.

The ore shipments from Sandon for the week ending Jan. 5 were 180 tons, and from McGuigan for the month of December 195 tons.——Rosebery is to have sampling works with a daily capacity of 100 tons.

In the Boundary country, a stamp mill is to be erected at Long Lake to treat the ores of the Anchor, Jewell and Enterprise mines.—— The Fontenoy, in Camp McKinney, has been bonded to J. F. Reddy and associates for $20,000, ten per cent being cash.——The shaft on the Mother Lode, near Greenwood, is down 183 feet, all in ore running from $25 to $60.—— The Magnolia and the Copperopolis in Copper Camp have been sold to a company represented by H. Brelich. Both properties have ledges of high-grade copper ore and development has already begun. The price was $40,000.——The Big Copper was sold to G. B. McAuley last week for $50,000 cash.——The Sitting Bull and Mary G. groups, near Windermere, have been bonded to R. R. Bruce for $30,000. The Red Lion group has been bonded to T. Starboard for $50,000. The Alice has been bonded for $5000 to R. R. Bruce.

LOWER CALIFORNIA.

In the Aurora gold mine at Alamo, which had been abandoned a few years ago, Maj. Russell recently resumed sinking from 213 to 250 feet, getting through the dike and finding more of the rich rock produced some years ago.——In the Viznaga mine near Alamo Hartzell & Davis have sunk the shaft 300 feet where good ore is being taken out.

At Agua Dulce the Fortuna M. Co. will at once resume work. The first to be done after overhauling the mill will be to unwater the Teresa mine. Until this is done the stamp mill will be operated with custom work, as there is considerable ore on the dumps at other mines in the district. The company has expended about $100,000 at this camp and has one of the most thoroughly equipped properties in Lower California. Day and night shifts will be put on until the mines are free from water, and then the force will be increased.

MEXICO.

At Bacoachi work has been resumed in the mines and mill of the Sierra Oro M. Co.—— On the 28th ult., Wells, Fargo & Co. shipped to the mint at Culiacan $8000 in silver bars to be converted into coin.——Latz & Bro. of Magdalena are erecting a 5-stamp mill upon their Francisco mine, near Llano station. This mine, which has a small but rich ledge of free milling gold ore, has always paid well by working its ores by the arrastra process.

Under the concession lately obtained by S. Camacho, reduction works of a daily capacity of 300 tons will be erected in Lerdo. An exemption from taxes for twenty years is granted in the concession.——The old San Jose mine near Suaqui Grande, Chihuaha, is being again worked.——A deposit of tin is said to have been discovered near San Miguel Allende and is being explored. —— The old silver and antimony mine, Los Yaquis, near Santa Ana, has been redenounced as the Cyrus.

Another consignment of high grade ore was recently made from leased ground on Harper's Dos Cabezes lead, near Casas Grandes. High grade ore has recently been taken out at Dos Cabezes by other leasers, and awaits pack animals and teams to transport it to the Sierra Madre railway.——The Providence mine, belonging to the St. Louis United Copper M. Co., is working ten men and began development work recently on a vein of copper 34 feet wide and is taking out ore.——The Congress mine, owned by the Candelaria M. Co., has over thirty miles of tunnels and is producing carbonate of lead ore, which carries both gold and silver. The Mexicans abandoned the mine because they had too far to pack the ore.

Two Republics: In the old Sabinal district, on the Sierra Madre railway, the Santo Domingo mine of the Corralitos Co. is shipping from 900 to 1100 tons of ore per month.——The opening of the railroad from Jiminez to Parral is aiding the mines in that camp. Hitherto the expenses of transportation have been too heavy for any but the best ores to be shipped, but now lower grade ores can be sold at a profit.——The Bismarck mine of the Corralitos Co. is shipping from 125 to 150 tons of ore per month, which is hauled by teams eight miles from the mine to the railway station. The Australia mine is also in good smelting ore. ——The San Pedro mines of the Corralitos Co. are shippers of high-grade smelting ores. On account of the steady increase in the output of the company's own mines and the demand made upon it by other mines tributary to the Sierra Madre railway, the Juarez smelter is being enlarged.——A. J. King of the Cinco de Mayo mine in Pilares district, Sonora, is shipping rich ore.——The gold mine of Kraft & Anderson, near Chihuahua, is one of the heavy shippers. The ore goes to the reduction works at the rate of 100 tons per day.

THE KLONDIKE.

Commissioner Ogilvie is reported to have made a recommendation to the Canadian Government that the 10 per cent royalty now collected on the gold output of the Yukon be reduced to 2½ per cent.

Commercial Paragraphs.

THE Lacy Mfg. Co. of Los Angeles, Cal., have the contract for making and laying the pressure pipe line for the hydraulic installation for the Mt. Whitney Power Co., Visalia, Cal. This line consists of 3300 feet of 20 and 24-inch pipe with a fall of 1300 feet. The heaviest pipe is one-half inch thick and total weight will be about 200,000 pounds.

THE advance in the field of electrical machinery the past five years has been stupendous. It is not reflected in the gross earnings of the electric companies because prices are so low. It is only a few years ago that the Westinghouse Electric Co. built the first 5000 H. P. generator. This was for the Niagara Falls power plant. Recently a Westinghouse man declared: "We are selling 5000 H. P. generators by the dozen;" and it was literally true. Including those already delivered to the Niagara Falls Power Co., the Westinghouse Co. has on its books orders for forty-five electric generators, each of 5000 H. P. capacity. Ten of these are for the Niagara Falls Power Co., sixteen for the Third Avenue R. R. Co. in New York City and fifteen for the St. Lawrence Water Power Co. The work at Niagara Falls seemed stupendous a few months ago—the harnessing of a section of this vast water power to drive ten 5000 H. P. generators for the transmission of power—but the thirty-five other 5000 H. P. generators now on the Westinghouse Electric Co.'s books will require to drive them water power or steam machinery to the aggregate amount of 175,000 H. P.

TEN years ago electrical energy was invariably supplied at a fixed rate per month for each installation without much regard to the amount actually furnished. To-day electric stations in this country supply on a meter basis the electricity they manufacture with resultant advantage to the station economy. Some idea of the extent to which the meter business in this country has grown may be gathered from the fact that not less than 200,000 Thomson recording watt meters alone have been manufactured and sold by the General Electric Co. The business has grown from small beginnings by the persistent missionary work which has been carried on by this company through both agents and literature. The latest addition to the meter literature issued from the General Electric press is "Thomson Recording Watt Meters" a handsomely printed and illustrated brochure in a rich cover, dealing with the different types of these recording energy meters, which the General Electric Co. manufacture, their uses and their advantages. Each type of meter is clearly described and so illustrated that its construction can readily understood. Full instructions are given for the care, connection and reading of these meters. The pamphlet should be found in the library of every electric light and power station, and will be sent on application made to the Schenectady office of the General Electric Co.

Recently Declared Mining Dividends.

Montana Ore Purchasing Co., quarterly dividend $1 per share; Jan. 20.

Grass Valley Exploration Co., a new corporation, owning the W. Y. O. D. mine, as well as an extensive group of mines in the Grass Valley mining district, has declared dividend No. 1 of 25 cents per share; Jan. 20. The directors are the Grass Valley bankers, Messrs. Joseph and Jacob Weissbein, and J. R. K. Nuttall, Louis B. Parrott, W. S. Keyes, of San Francisco. Thomas H. Simmonds is Supt. of the mines and works of the company.

Vindicator, Colorado, 5 cents per share, $50,750; Jan. 20.

Alaska Mexican G. M. Co., Alaska, 10 cents per share, $18,000; payable Jan. 28.

Alaska Treadwell G. M. Co., Alaska, 37½ cents per share, $75,000; payable Jan. 28.

Republic, Washington, 3 cents per share, $30,000; Jan. 10.

Morning Star, California, $4 per share, $9600; payable immediately.

Strong, Colorado, $20,000; payable Jan. 25.

Golden Cycle, Colorado, $5000; payable Jan. 25.

Montana O. P. Co., Montana, $80,000; Jan. 20.

Silver King, Utah, $50,000; payable Jan. 25.

Mercur, Utah, $25,000; payable Jan. 25.

Recent Mining Incorporations.

Algol Copper M. Co., San Francisco; capital stock, $100,000; subscribed, $50; C. H. Kingsley, F. Maguire, A. Williams, H. L. Mason, W. Stadtfield.

Moosehead M. Co., San Francisco; capital stock, $5000; subscribed, $60; W. McDonald, J. H. Dickinson, D. F. Baxter, C. R. Bronne, G. Cameron.

Kenai M. & M. Co., Oakland, Cal.; capital stock, $250,000; subscribed, $25,000; O. Morse, B. F. Brown, D. J. Brohr, A. S. Lasee, R. E. Ryan.

Otter M. & M. Co., San Francisco; capita stock, $500,000; subscribed, $25; J. J. Myers, A. B. Bennison, R. N. Graves, A. Cerf, H. W. Mathews.

Industrial Notes.

—Washington State produced $45,000,000 in '98.

—The receipts at the Manila custom house average $20,000 a day in gold.

—Four vessels recently brought $750,000 worth of whale products to San Francisco.

—American authorities at Hawaii have given permission to bring 6000 more Japanese laborers into the islands.

—The Hayward interest in the Coalinga Co. of Fresno, Cal., has been sold to Rawlings & Richardson, being a half-interest, for $121,500.

—Tulare lake, Cal., once the largest body of fresh water wholly within the United States, but which was dry last season, was sown to wheat this winter.

—Lewiston, Idaho, and Huntington, Or., are to be connected by a direct railroad along the Snake river, as it is proposed to build 330 miles of railroad by the O. R. & N. Co.

—The Santa Fe Railroad Co. has contracted for 160,000 tons of new steel rails at a cost of nearly $3,000,000, of the 72-pound class. They will be laid during '99.

—All the Columbia river salmon canneries in Oregon and Washington have combined—twenty-three in number; the capital stock of the trust is $2,000,000, understood to represent $4,000,000.

—In San Francisco the committee to devise methods of raising funds for the proposed Pacific coast exposition to be held in 1901 desires to raise a fund of $1,000,000 and to invoke State and national aid.

—The Pacific coast borax interests, the English Borax Co. and the Societe Lyonnaise of France have combined the business of producing borax and boracic acid. The capital stock of the trust is $7,000,000.

—The Great Northern railroad is credited with intention to operate its trains through the Cascade, Wash., tunnel by electricity, and also the entire distance—sixty-five miles—from Leavenworth to Skykomish.

—On Feb. 10th the sheriff will sell the property of the Tacoma, Wash., Land Co., valued at $3,000,000, consisting of the unsold portion of the Tacoma townsite, together with the docks, warehouse and unplatted acreage. During the "boom" days the company's assets were reckoned at nearly $10,000,000.

—The Redwood & Railroad Co., capitalized for $2,500,000 under the laws of Oregon, has acquired 20,000 acres of redwood timber land in Humboldt county, Cal., with twenty-five miles of railroad property, docks, mills, etc., and proposes to buy steamships, build additional mills, etc., to compass the annual manufacture of 50,000 M. feet of redwood lumber and 75,000 M. shingles.

—The U. S. Postoffice Department has contracted with the Pacific Steam Whaling Co., with offices at San Francisco, for mail service along the southern Alaska coast from Sitka to Unalaska, including all intermediate points. The distance is 1600 miles; every point in that stretch will now have a monthly service during the entire year.

—The Southern Pacific Co. for '99 has ordered fifty-one new locomotives, six to be consolidated freight engines. Each of the latter will weigh ninety-eight tons by itself and about 150 tons with its tender. An average freight engine weighs sixty-five tons; 3300 new freight cars have also been ordered. The company's new steel bridge over the Colorado river at Yuma will be finished April 1st.

—The market which the Philippines and the countries commercially adjacent to them offer to American manufacturers and producers is shown in a series of tables presented by the U. S. Bureau of Statistics. These tables exhibit the imports by articles, both quantities and values, into China, Japan, British India, Australasia, Siam, Corea, Dutch East Indies, French East Indies, the Philippine Islands and Hawaii, in each year during the past decade; also the proportion which each of the leading countries has had of the imports into those countries during the decade. A hundred million dollars' worth of goods go every month into the markets of these countries, whose great ports and business centers are, in most cases, located as near to Manila as Havana is to the city of New York. Their population is more than 800,000,000 and their total imports more than $1,000,000,000 every year, and rapidly increasing. The imports into China in 1886 were $108,000,000; in 1896 they were $171,000,000. The imports into Japan in 1886 were $30,000,000; in 1896, $100,000,000. Imports into British India in 1886 were a little over $100,000,000; in 1896, nearly $150,000,000. Australasia shows imports of over $300,000,000, though this includes the imports of each colony from the other colonies, as well as from the other parts of the world. To the individual producer or manufacturer who desires to determine whether a market is to be found in the Orient for his products these tables will supply detailed information. The following table shows the importation into China of the principal articles in 1886 and 1896, thus indicating the growth of her importations during that period. The values are stated in Haikwan taels, and in determining the increase the fact should be borne in mind that the Haikwan tael, which on Jan. 1, 1888, was valued at $1.15, was on Jan. 1, 1896, valued at $0.81; and that while the figures of the total importations show an apparent increase of more than 100 per cent the actual increase is something less, because of the depreciation of the tael, whose value fluctuates with the price of silver:

IMPORTS INTO CHINA.

	1886. *Haikwan taels.*	1896. *Haikwan taels.*
Coal	1,799,000	3,354,000
Cotton, raw	826,000	1,308,000
Cotton yarn and other	7,869,000	32,010,000
Gray shirtings	7,011,000	12,328,000
Shirtings, other	3,260,000	7,983,000
Other cotton manufactures	10,910,000	26,932,000
Total cotton manufactures	29,050,000	79,243,000
Ginseng	583,000	1,620,000
Machinery	181,000	2,084,000
Matches	805,000	2,100,000
Iron and manufactures	1,758,000	3,808,000
Tin and tinplates	1,311,000	2,357,000
Metals of all kinds	5,349,000	9,759,000
Kerosene oil	2,211,000	8,156,000
Rice	920,000	15,022,000
Sugar	542,000	7,002,000
Timber	695,000	1,182,000
Wool manufactures	5,636,000	5,363,000
Flour (pounds)	88,533,000	230,800,000
Total value of imports	87,479,000	202,590,000

The following table shows the value of the principal articles imported into Japan in 1886 and 1896, stated in the yen, the value of which in 1886 was 81c and in 1896 53c:

IMPORTS INTO JAPAN.

	1886. *Yen.*	1896. *Yen.*
Corn and flour	198,000	10,352,000
Sugar	5,640,000	13,854,000
Cotton, raw	695,000	22,573,000
Iron and steel	288 000	1,636,000
Cotton yarn	5,913,000	11,545,000
Woolen yarn	61,000	1,115,000
Iron, wrought or partly	1,357,000	12,104,000
Cotton tissues	2,295,000	11,636,000
Woolen tissues	2,234,000	14,276,000
Scientific instruments	914,000	10,622,000
Drugs and medicines	972,000	4,303,000
Petroleum	2,358 000	6,331,000
Value of total imports	37,568,000	179,820,000

Personal.

E. T. HALE succeeds W. L. Turner as Supt. Rawhide mine, Jamestown, Cal.

J. D. SPARGO has been appointed Supt. South Daisy mine, West Dip, Utah.

ROBT. DE LARGE is building a 10-stamp mill at Col. Brodie's mine, Briggs, Arizona.

A. S. BIGELOW has resigned the superintendency of the Delhi, Nevada Co., Cal., mine.

GEO. MAINHART, part owner Bullion mines, Grass Valley, Cal., has returned from San Francisco.

H. J. KUBLI, managing owner Golden Standard mine, Grant's Pass, Oregon, is in San Francisco.

J. D. HEARD, Alameda, Cal., managing owner Greenhorn Blue Gravel mine, Yreka, Cal., is spending a week at the mine.

EDWARD N. LINDSAY, who has been examining mines along the mother lode for several months past, is at present in Calaveras Co.

J. SCOWDEN of London, England, is unwatering the Texas mine, at Hart, Cal., with a view to a purchase of the property for his company.

C. A. HAMILTON of San Francisco has returned from Shasta Co., Cal., where he has been examining copper properties for a New York company.

MAJOR W. H. HEUER of the U. S. Debris Commission was in Nevada City, Cal., this week, inspecting the new restraining dam for the Canada Hill hydraulic mine.

A. BELL, London, England, owner of the Gopher-Boulder mine, Kelsey, Cal., is in San Francisco. Mr. Bell's mine was the first in California to introduce electric power.

LIEUT. HENRY T. MAYO, U. S. N., who for a number of years was stationed at Port Townsend, Wash., has been ordered to report for duty at the Union Iron Works, San Francisco.

PHILIP DEIDESHEIMER, the veteran Comstock miner, received a medal from the Omaha Exposition for his model of the Comstock, Nevada, mine timbering system, of which he was the inventor.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JANUARY 10, 1899.

617,355.—WATER WHEEL BUCKET—T. K Blue, S. F.
617,477.—SEAL LOCK—A. W. Coffin, S. F.
617,416.—EGG BEATER—W. R. Ellis, Woodland, Cal.
617,589.—CARPET STRETCHER—C. Gosemann, Medical Lake, Wash.
617,486.—GRAIN SEPARATOR—B. Holt, Stockton, Cal.
617,527.—PROPELLER—A. Howard, S. F.
617,528.—VALVE GEAR—A. Howard, S. F.
617,529.—ENGINE—A. Howard, S. F.
617,530.—POWER APPARATUS—A. Howard, S. F.
617,420.—RAILROAD CURVE SWEEPER—G. Huff, Tropico, Cal.
617,466.—GOLD SAVING APPARATUS—J. R. Macmaster, Pomeroy, Wash.
617,471.—BRIDGE AND WHARF FLOORS—J. G. McMillan, San Jose, Cal.
617,473.—BORING MACHINE—Parsley & Cottrell, Hornbrook, Cal.
617,512.—GOLD SAVING APPARATUS—L. E. Porter, Los Angeles, Cal.
617,407.—ROCK DRILL—A. Rosenholz, S. F.
617,384.—MUSIC LEAF TURNER—A. E. Smith, Los Banos, Cal.
617,619.—PUNCH—L. Van Dorin, San Bernardino, Cal.
617 377.—GANG PLOW—A. V. Wilbur, Stockton, Cal.
617,378.—DISK HARROW—A. V. Wilbur, Stockton, Cal.
617,379.—GANG PLOW—A. V. Wilbur, Stockton, Cal.
29,970.—DESIGN CLOCK BACK—N. L. Whedon, Everett, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

QUICKSILVER!
—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, 426 CALIFORNIA STREET,
SAN FRANCISCO.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BRIDGE AND WHARF FLOOR CONSTRUCTION.—J. G. McMillan, San Jose, Cal. No. 617,471. Dated Jan. 10, 1899. This invention relates to improvements in the construction of floors for bridges and wharfs. It consists essentially of lengths of timber of alternate thicker and thinner material laid lengthwise upon the bridge and upon supporting timbers which may be thicker in the center than at the sides to provide a proper crown to the surface, the strips being spiked together, with the thicker ones having a greater height than the thinner ones, so as to form channels between for the reception and support of the asphalt or cement surface, which is afterwards placed thereon and which forms the wearing surface of the structure.

SEAL LOCK.—A. W. Coffin, San Francisco, Cal. No. 617,477. Dated Jan. 10, 1899. This invention relates to a device for locking and sealing cars, rooms, receptacles, and is especially designed for use upon freight cars, where it is desirable to seal the doors to prevent any removal or tampering of the goods contained therein. It consists essentially of the combination of a hasp or other attachment having a hook pivoted thereto and adapted to engage a staple or staples upon the side of the car with a rotary disk pivoted upon the hasp and a destructible connection which is operated by the movement of the hasp so that it will be impossible to disengage the hook without breaking the seal. In the present case the seal consists of a slotted strip fitting over bent lugs, which hold it in place when the hook is engaged and prevented from being turned backwardly.

BORING AND MORTISING MACHINE.—G. T. Parsley and G. C. Cottrell, Hornbrook, Cal. No. 617,473. Dated Jan. 10, 1899. This invention relates to a machine which is especially designed for boring and mortising purposes. It comprises a main frame with means for holding it in position horizontally, guides fixed thereon, a supplemental base carrying standards and operative mechanism and slidable within the guides and locking devices, including lever arms at opposite sides of the base, and having rigid fulcrum pins projecting at right angles through the standards and engaging the guides, the levers being so connected that they move in unison so that the bases may be secured at any point of adjustment. Rack teeth upon one of the guides and a toothed segment pivoted to the movable base and standard with its teeth engaging the rack bar allow the apparatus to be moved and adjusted upon the main frame. A vertically disposed rack bar upon the standards is arranged to be brought into engagement with a pinion upon the crank shaft so that by turning the latter the boring or mortising mechanism is raised and an automatic latching mechanism serves to hold it after it is so raised.

GRAIN SEPARATOR.—Benjamin Holt, Stockton, Cal. No. 617,486. Dated Jan. 10, 1899. This invention relates to an apparatus which is especially designed for adjusting and regulating the shaking or oscillating motion of the shoes in grain-cleaning devices. It is especially designed for use upon that class of cleaners which are employed upon harvesting machines and supplemental to the separators, so that grain which has been separated from a great portion of the straw and chaff is afterwards transmitted directly to these cleaners while the work is completed. It consists essentially of anti-frictional rollers or surfaces fixed to the shaking shoes and contacting with rollers, the surfaces of which are made essentially cylindrical at one end and oval at the opposite end, with a gradually progressive change in the surface from one end to the other. A mechanism is employed whereby these rollers may be moved so as to bring any portion of these lengths to act upon the cleaning shoes and thus vary the amount and character of the shake which is imparted to the shoe.

ROCK DRILL.—Alfred Rosenholz, San Francisco, Cal. No. 617,407. Dated Jan. 10, 1899. This invention relates to drills of that class which are especially adapted for perforating rock and other hard substances. It consists essentially of an adjustably supported casing and guides, a post or standard and mechanism by which the casing and guides are supported and advanced, a hollow plunger guided and slidable in the casing, a piston fitting and independently movable within the plunger, said casing being enlarged at one end having a shaft journaled in this portion out of line with the axis of the plunger, a removable cap at the end of the enlarged portion of the casing adapted to expose the plunger chamber in the line of its length to permit the ready removal of the operative parts, a drill shank connected with the piston and means for rotating the same, a crank on the drive shaft and a rod connecting the same with the plunger and means for operating the shaft.

THE WESTERN CHEMICAL COMPANY,
DENVER, COLO.,
—FOR PRICES ON—
Chemically Pure Acids and
Chemically Pure Ammonia.
These goods are pronounced of a very superior quality by the large number of consumers who are now using them.

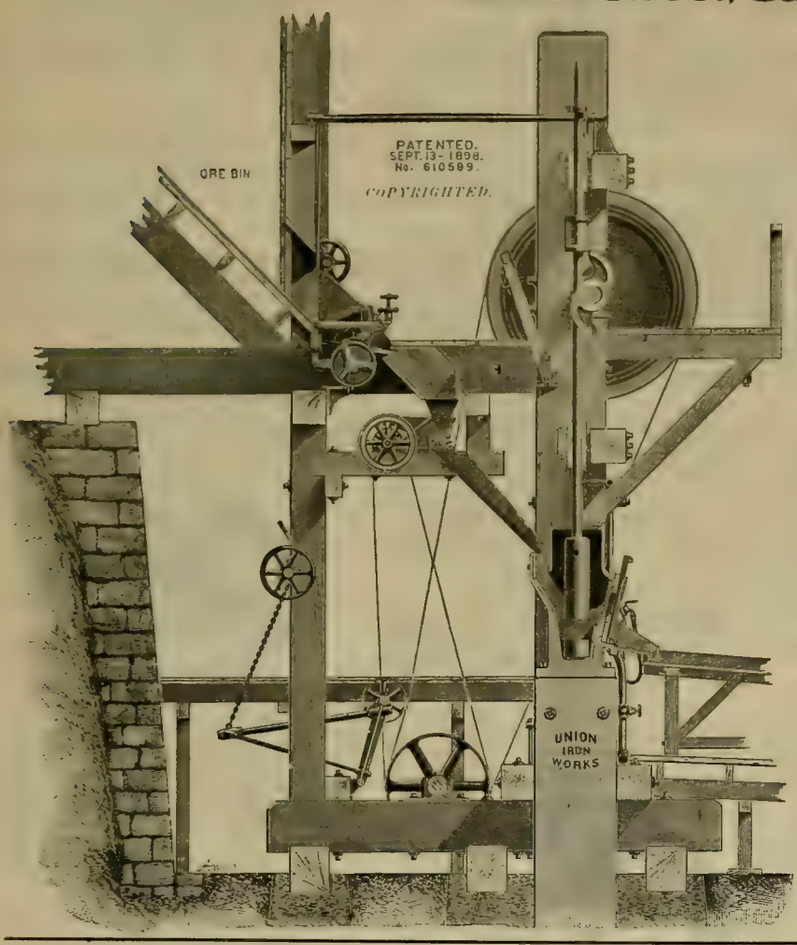
UNFAIR COMPETITION.
Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would be patrons we repeat:
All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co" and where there is room for it, with our trade mark  Our German drawing instruments bear only the trade marks or
We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets
Duplex Universal Anvil Paragon Normal
are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.
Very respectfully, KEUFFEL & ESSER CO.

The State Ore Sampling Co.
DENVER, COLO.
We buy Gold, Silver, Lead, Copper, Bismuth, Uranium, Wolfram, Cobalt and Antimony Ores. With modern mills and machinery our facilities for sampling ores are the best.
Our long experience in the market enables us to obtain the highest prices for all marketable ores. Write for our "Reference Book." Send analysis of your ore for prices and information.
BAILY & MONNIG, Managers.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., 145 and 147 Beale St. S. F.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

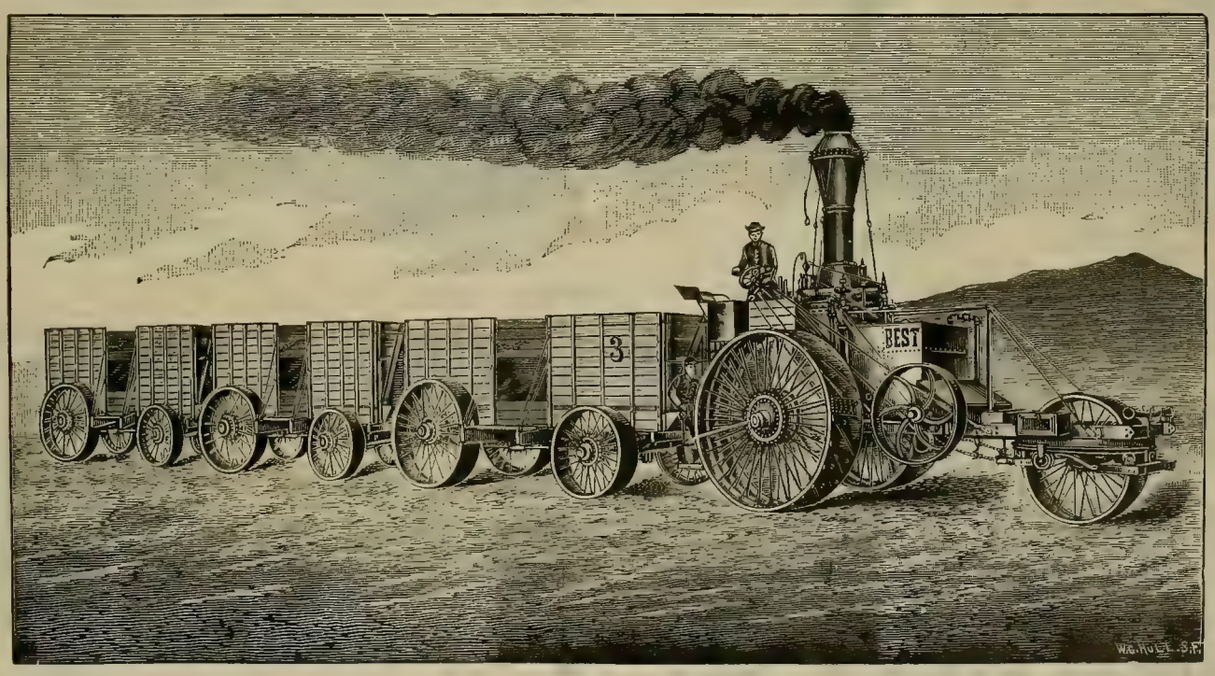
We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

A REVOLUTION IN FREIGHTING.



THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Log Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

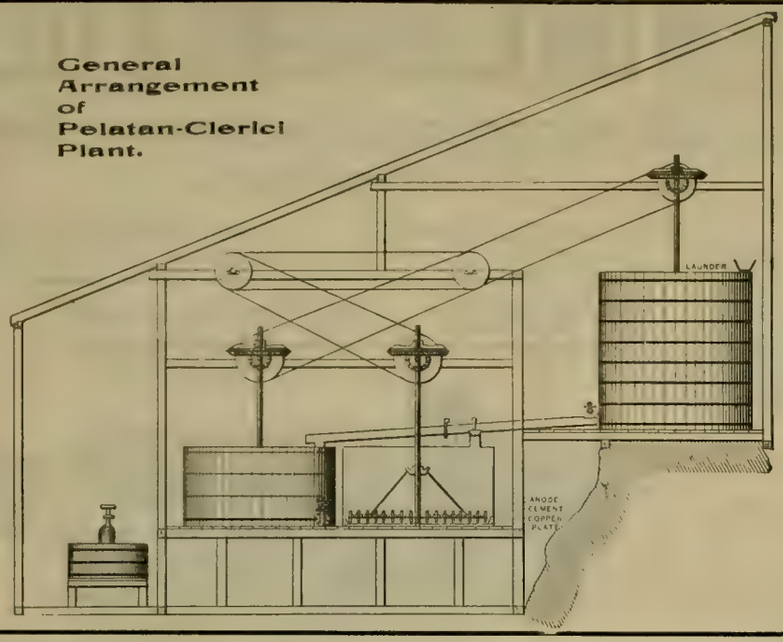
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves more than 85 per cent by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process. Cost of treatment is less. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge.

Simplicity. Economy. Efficiency.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

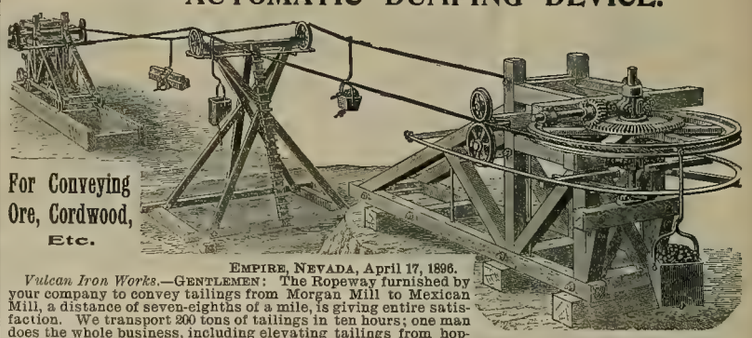
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1899, an assessment (No. 12) of Ten Cents (10c.), per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of January, 1899, an assessment (No. 20) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 21st day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

MARINA MARSICANO GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of January, 1899, an assessment (No. 17) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1899, an assessment (No. 115) of Twenty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on TUESDAY, the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 22) levied on the 3rd day of December, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
H. F. Anderson	93	2,000	$60 00
Calvert Meade, Trustee	196	200	6 00

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of December, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 106 Liedesdorff street, San Francisco, California, on MONDAY, the 30th day of January, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. CALVERT MEADE, Secretary.

Office — 106 Leidesdorff St., San Francisco, California.

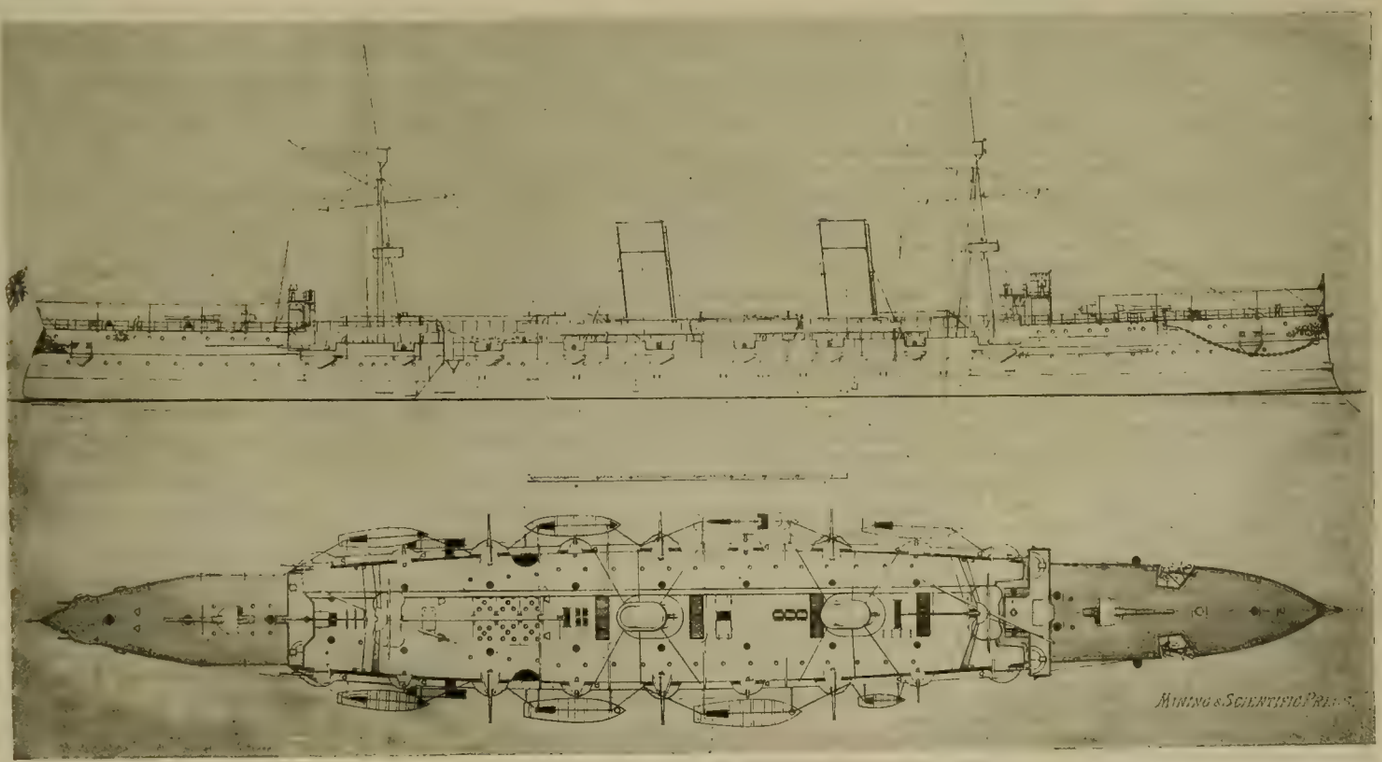
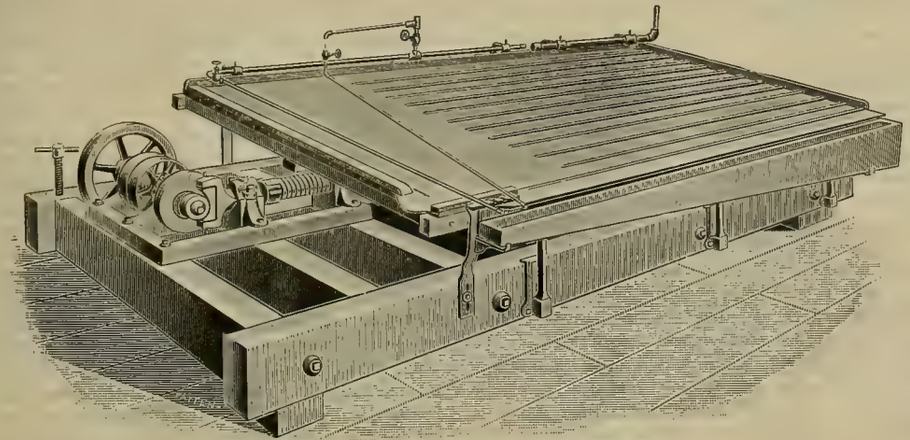
Railroad Construction in California.

Building the second transcontinental line to San Francisco involves some engineering problems that are being successfully solved. One of these occurs in the seventy miles between that city and Stockton, where nine miles of roadbed sufficiently solid to safely bear up heavy railroad traffic must be built across a wide expanse of "tule" lands. Four large dredgers are there employed, cutting canals 65 feet wide and 25 feet deep. The material removed is piled inward, thus building up a roadbed 100 feet wide and leaving a drainway on each side. The work is done at intervals, a layer of muck removed and dumped along the line of the roadway and allowed to thoroughly dry before another similar one is superimposed. The accompanying engraving shows the dredger Golden Gate at work.

DREDGER MAKING ROADBED FOR RAILWAY ACROSS TULE LANDS NEAR STOCKTON, CAL.



THE CALIFORNIA-BUILT JAPANESE CRUISER CHITOSE. (See page 89.)



NEW WOODBURY IMPERIAL CONCENTRATOR.

New Woodbury Imperial Concentrator.

The saving of fine sulphurets which contain a certain amount of values in ores, and reducing the losses while performing the work of concentrating to a minimum, with the most simple and inexpensive machinery, occasions constant effort to improve on what has already been accomplished. While the belt concentrators have and do produce good results, in concentration as in all other mining processes there is constant aim at improvement. Geo. E. Woodbury of 141 First street, San Francisco, who has been engaged in the manufacturing of belt concentrators for twenty years, considers that the field for such improvement in the line of concentrators and tables is not exhausted, and hopes to simplify the construction, lessen the cost of machinery, to give it a larger capacity with less care and attention, and at the same time do good work. He has invented the "Imperial table," herewith illustrated, and claims for it the essential merits as stated.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Dredger Making Roadbed for Railway Across Tule Lands near Stockton, Cal.; The California-Built Japanese Cruiser Chitose; New Woodbury Imperial Concentrator, 85. Latest Mining and Metallurgical Patents, 90-91. Jeffrey Electric Motor Car for Mine Haulage; Jeffrey T. M. 110 Electric Locomotive; Special Motor Car for Handling Slag Cars in Smelting Works, 92. W. D. Curtis, Los Angeles, 96. How to Build and Operate an Arrastra, 97-98-99. Telluride, Colorado, and Surroundings; Savage Basin, Six Miles from Telluride, Colo.; Silver Pick Basin, Twenty Miles from Telluride, Colo., 101.

EDITORIAL.—Railroad Construction in California; New Woodbury Imperial Concentrator, 85. Prospectus of a Mining Property; Most Noticeable Feature in Metals in '99; Market Value of Ores; Arrastra Structure and Operation, 86.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 93-94-95.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 114.

MISCELLANEOUS.—Concentrates, 87. Platinum, 88. Some Needed Aids to Development of Mines; California-Built Japanese Cruiser; Some Modifications of the Cyanide Process, 89. Reciprocity on This Side; Existing Conditions in the Klondike; Advertising in Trade Journals; Latest Mining and Metallurgical Patents, 90. Liquefied Hydrogen; An Important Yukon Decision; Valuable Flue Dust, 91. Electric Motors for Mine Haulage; Grade of Battery Plates, Water Supply, Etc., 92. Industrial Notes; Personal; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Our Southern California Representatives; Recently Declared Mining Dividends, 96. How to Build and Operate an Arrastra, 97-98-99. Electricity in Mining, 99. Some High Mines of Telluride, Colo.; Phœnix, California, Group of Gold Mines, 101. Gold Mining and Milling in South Africa, 102.

IT is often noticeable that in the prospectus of a mining property great emphasis is laid on its contiguity to some famous producer; usually such a claim is accompanied by a map showing how, if the course of the vein of the "Baby Mine" or "Success" be continued, it surely cuts squarely through the "Copper Gong" or Golden Lyre," for sale. Yet, such contiguity is to some minds an argument against investment, as faults and breaks are so frequent that it by no means follows that, because a certain property is valuable, adjacent ground must prove equally rich. The reverse is too often the case to deceive miners into belief in the implication. In gold mining particularly the ore veins are likely to follow along the lines of least resistance, without special regard to continuous direction.

THE most noticeable feature in metals in '99, so far, is the appreciation in the price of lead, copper and tin. For the first time since October 15th, '97, lead has smelter quotations above the $4 mark; the general average price for '98 was $3.63. Though the United States lead production in '98 was 15,624 tons, yet its consumption has been proportionately greater, and the trade looks for a fine market in '99; to-day's New York quotations are $4 27½. The continued non-existence of tin in commercial quantities in the United States, coupled with the increasing demand for that metal, causes substantial appreciation in its price. In the case of the price of copper it seems amid combinations on the one hand, and enormous consumption on the other, that the only question is where it shall stop in its advance; to-day it is quoted by New York brokers at $16.25. Silver steadily stays below the 60 cent mark. Its place in the world's work is among the financial rather than the industrial column. During '98 this country brought in from abroad silver to the value of $29,029,724, and exported it to the amount of $53,797,104, just about the same as in '97. Gold ostensibly remains the same, though as its worth is determined by its purchasing power, it appreciates when prices drop, and depreciates as general values rise. The advance in real estate and other values all over the country during the past six months, the glut of gold in the United States treasury, and the balance of trade in favor of this country are among recent causes that make for gold's depreciation in value as a purchaser. During '98 this country sent abroad only $16,194,954 in gold, and imported $158,036,252, a wonderful contrast to other years. Even in the year previous, '97, the United States had sent out more gold than it received, yet in '98 we find that this country imported $141,841,298 more gold than it sent away.

Market Value of Ores.

A southeastern California miner writes regarding alleged discrimination and incorrect valuation of ores shipped to San Francisco, making some statements that, if susceptible of proof, deserve attention. He declares that in the vicinity of Big Pine, Inyo Co., are silver mines producing ore running from $100 to $500 per ton, and containing some gold, but that the shippers can only get from one-quarter to one-half their value from the smelter.

The market value of ore is a vital question to every ore producer who chooses to send away his product for treatment. Gold ore or any other kind of metal-bearing ore should be determinable in value, and, theoretically, it is, just the same as oil or wool or timber. Just how this value is to be determined is the question. The complaint of the Inyo Co. man is not an isolated case. Wherever ore is so produced, be it California, Colorado, Montana, Utah or Idaho, the same allegation is frequently made. In this regard it is worthy of note that the smaller the amount individually shipped the greater the amount of individual complaint. The men or companies who ship the most complain the least. Instances are not wanting where 4000 tons of ore are annually received by one California concern from one shipper without one complaint from the latter during the year. Doubtless did occasion arise, or seem to require, so large a shipper would institute an inquiry, look even more carefully than ever to the correctness of his samples and assays, and, if discrepancy continued, would have an umpire appointed whose decision would be final as between him and the smelter. Small shippers have not, ordinarily, the facilities or do not take the trouble to assure accuracy in the important matter of sampling, which, manifestly, is of even more importance than the assay, for upon the correctness of the sample as fairly representing the ore depends the proper rating of the value of the entire ore shipment. While we are not authorized to more than suggest, it is obvious that in the case of any reputable smelting concern in California or Colorado, or anywhere else, wherever any complaint is made, proper notice will be taken and an honest endeavor made to satisfy the producer regarding the correctness of the returns made him.

In considering the business of buying and selling ores it is best to assume entire fairness and honesty on both sides, eliminating guesswork, supposition and suspicion, and arriving at correct results by intelligent methods. Belief, however sincere, or opinion, however hopeful, has nothing to do with the facts. Because a man honestly believes that his ore shipment will go $100 to the ton does not insure so desirable a result, and its failure to come up to expectation only engenders suspicion regarding the methods of the smelter. Better every way for him to be sure of his samples; to be accurate in sampling and reasonably certain as to its value. It sometimes happens that after a man has put in, say two months' hard work getting out a little jag of ore, as the days go by his reiterated belief that it is "$100 rock" will result in a positive frame of mind by the time that he ships it, and if the facts do not agree with his estimate, so much the worse for the facts.

On the part of a responsible smelting establishment it is in every way to the interest of such a concern to be scrupulously honest in its dealings with miners. It cannot afford in the long run or the short run to be otherwise. Assays, approved, accurate and definite, determine the value of every shipment large or small, and deducting the fixed charges and expenses of treatment, the resultant remainder belongs to the shipper. There should be fair profit to both, and a thorough understanding on the part of the miner as to what he may reasonably expect. It is of course natural for a miner after months of toil to suspect unfairness if, upon paying freight and smelter charges, the result is little or nothing, and yet it does not follow that he was unjustly or unfairly treated. In smelting, cyaniding, chlorination, or anything else, there is always some unavoidable loss; a small lot of ore costs more, proportionately, than a larger quantity; freights and fixed charges fluctuate, and results exact, and impartial, rarely bear out previous assumptions or estimates. As to the shipper, it must be borne in mind that no one can continue to cheat him; but he must not cheat himself: he must be reasonably certain of the value of his ore. As to the smelter and ore buyer, no one in that business can afford to be otherwise than perfectly square; as a business proposition no ore buyer or proprietor of a reduction plant can continue to act otherwise than honestly, but he has to be honest with himself as well as his customer, and though the values may not be there, the freight and reduction charges count up just as much as though they were.

Upon accurate sampling of the ore depends largely the solution of this matter. Where a fair sample repeatedly gives a certain value, the returns ought to approximate such value, making due allowance for unavoidable loss, but no producer has just reason to expect that one or two assays from picked samples can determine the result in a manner mutually satisfactory to both buyer and seller.

Arrastra Structure and Operation.

"Why don't you illustrate and give in detail how to build and operate an arrastra?" has been the substance of an unusually large number of inquiries during the past five months. It is evident that despite the advance in methods of handling ore this ancient system is still in favor in many remote localities. Accordingly data, detailed description, sketches, etc., were secured, and in the issue of the 14th inst. appeared an article going into the thing from start to finish. In this issue is another article of equal practical interest. It is believed that these two articles will thoroughly cover the whole matter. Either one of them would probably be sufficient, but both should fill the field of arrastra literature for the next ten years. So far as observed the two articles in the issue of the 14th, and of this date, are the first of the kind, giving details of construction and operation, and written by men who, as usual, with our contributors, know what they are talking about.

Though in these modern days of scientific mining, with crushers, rolls, and hundred stamp mills, the arrastra seems a slow and poky affair; yet, rude though it be, and humble its place, it has an honest record and deserves notice. Though seemingly stupid and archaic as the burro that often furnishes the motive power, it is not without its good points. Unlike more pretentious devices, the car and battery assays agree; what goes in is accounted for; the outfit never strikes, and rarely blows up or burns down; if anything breaks, the accident is not costly, and repairs can be made on the spot; there is little science and less style; it is as sure as it is slow; its accounts are simple and easily kept; it usually makes money for its owner, and this is a good feature about mining machinery of any kind. All over California and the coast; up the gulch in Montana; over the other side of the hill in Idaho; up a little ways in Arizona; on the opposite side of the canyon in Colorado, are found those old-fashioned concerns, which, so far as free-milling gold is concerned, are fairly successful. Water, steam and burro power—the latter in greater evidence—are used; it is unlikely that direct electrical connection or an air compressor would be found anywhere supplying the force that makes the drag go round.

Everything is relative; doubtless when some of our remote Mexican readers see the issues of the 14th and 28th, they will want to discard the old, old arrastra in use there for the last hundred years and take up the newer designs therein portrayed, for, as in everything else, there are fashions and progress even in the building and operation of arrastras. Many a miner all over this west half of the continent will be busy comparing his arrastra with those illustrated and described in these columns, and will soon decide whether the old way is good enough for him, or whether he shall adopt some of the new pointers. He may conclude to go on as before till developments warrant his getting modern machinery; for the operation of an arrastra ofttimes precedes the purchase of modern, up-to-date mining machinery. Where the quantity of ore is limited, or the owner is short of money, or transportation facilities preclude the transit of machinery; where reduction works do not exist, and isolation tends to bar development, there is the home and there is the province of the arrastra, and in many an instance that humble appliance has ground out the bullion that paid for the fine mill that in the evolution of things finally superseded it.

Concentrates.

IN '98, West Australia produced in gold 1,050,183 ounces, in '97, 674,989 ounces.

NEVADA miners ask that State's Legislature to pass an eight-hour law, similar to Utah's.

WYOMING is about to establish at Cheyenne a State executive department of mining and mineralogy.

AT the Alaska-Treadwell mill, Douglas Island, Alaska, on March 1, 720 stamps will be in operation.

THE Arizona Legislature contemplates a bullion tax on the net proceeds of mines in that Territory.

PRIVATE London advices indicate as being very unlikely any severe attack of Klondicitis there this year.

ABOUT two and one-half tons is the daily duty of a 650 pound stamp with ninety 12-inch drops per minute.

CALIFORNIA miners, in and out of the State Legislature, should endorse and aid every effort to secure good roads. It's business.

STEPHANITE—black silver—is composed of silver, 70.4%; antimony, 14%; sulphur, 15.6%. Silver glance is made up of silver 87.04, sulphur 12.96.

OIL, maltha and natural gas are reported discovered on the borders of San Luis Obispo and Monterey counties, Cal., near Parkfield, occasioning a land "boom."

IF fifty ounces of slimes are worth $12, one ton would be worth $3499.99. One acre of ground 3 inches deep, allowing 20 cubic feet earth to the ton, contains 544 tons.

THE Southern California Railroad pays about $9 per ton for its coal; the Southern Pacific Co. about $5. Both roads are reported abandoning the effort to burn oil in their engines.

"THE best general way of treating metallic ore" is a big question that would require a voluminous treatise to attempt to answer. The best answer that occurs is "by smelting."

IN order of malleability aluminum ranks third, and sixth for ductility. It is usually alloyed with 6% of copper. This alloy has a tensile strength of fourteen tons per square inch.

IN Telegraph creek, on the Gila river, in New Mexico, is a formation said to be exactly similar to the "banket" reef of South Africa, geologically interesting, but of no industrial value.

THE newest process for "galvanizing" or coating iron or steel is immersion of cleaned sheets of iron or steel in a bath composed of (by weight), zinc, 84%; tin, 14%; lead, 1.5%; aluminum, 0.5%.

A "FAULT" in its widest sense signifies any displacement or interruption in the continuity of a vein. Veins, in general, are most productive near the junction of stratified and unstratified rock.

A DELINQUENT co-owner has ninety days from the date of last publication of notice of forfeiture to pay up his share of cost of labor and improvements necessary to hold an unpatented mining claim.

SODIUM AMALGAM can be used in coating copper plates with quicksilver. It should be used very sparingly. One part of sodium (by weight) to 2000 parts of quicksilver is about the right proportion.

IN a good ice plant of ordinary dimensions from five to eight tons of ice can be produced for each ton of coal. The Vulcan Iron Works, 505 Mission street, San Francisco, Cal., make such ice machines.

CHLORIDE OF SILVER ("horn silver") fuses at 500° Fahr. It cannot be decomposed by charcoal unless water be present; in that case hydrochloric acid and carbonic oxide are formed, and the silver is liberated.

WIRELESS telegraphy is interesting and a promising field for electrical research. Most of the daily newspaper articles and illustrations thereon are ridiculous. Its economic use is an improbable possibility.

WITH a 9-inch pipe, 6000 feet long, and a 600-foot head of water, the velocity of the water per minute would be 785.4 feet. In all streams the velocity is usually greatest at the surface and in the middle of the current.

ORDINARY interpretation of the 29th statutes at large, U. S., passed March 2nd, '97, would occasion an affirmative answer to the question, "Can a British or an English company legally hold mineral claims in Alaska."

THE Kern Co., Cal., man who writes for information about divining rods to locate gold is on a barren trail. It were as wise to essay the tangible effect of a chimera revolving in a vacuum as to consider any such divination.

IT is asserted that the Western Electric Co. is casting 300 to 500 pounds of copper daily, which have an electric conductivity of above 90% and as high as 99.52% as compared with below 50% conductivity in ordinary casting copper.

GRAPHITE, as it comes from the mine, contains from 50% to 60% silica, sulphur and other impurities, and the process of completely freeing the graphite from impurities requires expensive machinery and skillful manipulation.

STAMPS vary in weight as to custom and ore requirement of different districts, from 600 pounds in Gilpin Co., Colorado, to 1200 pounds in El Dorado Co., Cal. With an 850-pound stamp the stem weighs about 360 pounds, the head 225, the tappet 115, and the shoe 150.

"FREE AIR" means air at atmospheric pressure—15 pounds per square inch sea level. Calculating the efficiency of an air compressor at 100%, at that level, the barometer standing at 23.83 indicates an altitude of 6000 feet and a comparative efficiency of 82.8%.

REGARDING the alien act, mentioned in last week's issue as passed by the British Columbia Legislature, on the 18th inst., it is understood that the Canadian members of the American-Canadian commission have agreed on international mining terms which vitiate the act.

"A MINING property that isn't giving a net income is worthless." Not logical. If so, then no prospect not in pay ore is of any value. If that argument obtained, goodbye to all development. There is scarcely a mining property of any value anywhere that was a continuous paying success from the very start.

ONE who goes no further than to experiment with an invention and then gives it up, and attempts to attain the object by other means, and who afterwards purchases articles manufactured under it from another, who has obtained a patent for it, has abandoned it, and the patentee is entitled to hold it.

CONCENTRATED food for miners and prospectors is a very pretty theory, and doubtless the Chicago correspondent is in earnest and means business; but it is probable that for the remainder of the century at least, bacon, beans, biscuit and coffee will continue to hold the place of honor in the prospector's cuisine.

IN '97, in the Rand, South Africa, gold district, there were in operation 4675 stamps; in '98, 5042; the tonnage crushed in '97 was 5,325,355—about 4¼ tons per stamp per day. As in the United States the tendency is to increase the capacity per stamp. In the past ten years that district has yielded $320,000,000 in gold.

THE royalty charged leasers is largely a question of local custom and observance. Some owners demand 50% and will only give a twelve months' lease; others, elsewhere, are content with 25% and a contract that is not ironclad nor one-sided. A current blank form of Colorado lease was given on page 616 in the issue of June 11th, '98.

TO FIND the number of gallons delivered per minute by a single double-acting pump at 100 feet piston speed per minute, square the diameters of the plungers, then multiply by 4. For duplex double-acting pumps, multiply by 8 Example, a 10-inch duplex pump will deliver 10x10x8=800 gallons of water per minute at 100 feet piston speed.

THE last report of the Canadian Mining Annual puts the total value of the mineral output of Canada for 1897 at $28,000,000, an increase of $6,000,000 over that of 1896. The output is divided among the principal mining provinces as follows: British Columbia, $10,456,268; Nova Scotia, $6,000,000; Ontario, $5,000,000; Quebec, $2,063,266; Northwest Territories and Yukon, $3,000,000.

"THE Quicksilver Mines" of California is the title of a company whose prospectus states that the property is the Redington quicksilver mine and comprises 6160 acres in Napa Co., Cal. It has been reported on by Messrs. Newcomb and Symington. The nominal capital is $750,000; offered for subscription, $500,000; the purchase money is, cash, $75,000; optional, $550,000; working capital, $125,000.

THE efficiency of boilers, engines and dynamos is now so high that little improvement can be expected. On the other hand, the optical efficiency of nearly all known sources of light is extremely low, these being the latest determinations: Oil lamp, 0.073%; ordinary gas flame, 0.33%; electric incandescent lamp, 1%; arc lamp, 3.875%; magnesium light, 15%; sun, about 31%; Geissler tube, 32 7%.

ZINC LEAD ores are not specially difficult of treatment. The Eastern smelting firms mentioned can treat them, but probably no better than they could be handled within fifty miles of where our Colorado correspondent writes. For an ore going, lead 20%, zinc 25%, silver 20 ounces, there ought to be no difficulty in getting $10 per ton, and if the ore goes more than 20% lead or 25% zinc, an additional payment.

THERE are twenty-seven volumes of the Transactions of the American Institute of Mining Engineers. Vols. I to IV, inclusive, cost $3 each; V to VIII, inclusive, $4 each; Vols. IX and X, $10 each; XI to XXVII, inclusive, $5 each. The cost of a complete file of the MINING AND SCIENTIFIC PRESS is not exactly statable. There are not more than twenty such files in existence. Such a file would probably be cheap at $2500.

SECTION 5 of Arizona's present mining law says: Any open cut, crosscut, adit or tunnel which shall be made, as above provided for, as a part of the location of a mining claim, and which shall be equal in amount of work to a shaft 10 feet deep and 4 feet wide by 6 feet long, and which shall cut a lode or mineral in place at a depth of 10 feet from surface, shall be equivalent as a discovery work to a shaft sunk from the surface.

IN the U. S. Senate last Saturday, Senator Perkins having had made a canvass of the Senate, found that there were enough votes to pass the California mineral land bill and was ready to move that measure. He was informed, however, that "this would be considered an unfriendly act by the friends of the other bills," and so had to suspend operations. Late Washington advices say that the bill "will be brought up as soon as possible."

APPROXIMATELY the '98 output of the West in metals aggregated $150,000,000—not like wheat or barley consumed, but added to the permanent wealth of the world. This crop occasioned wide distribution of returns, placing transportation charges at $15,000,000, cost of reduction $20,000,000, operating expenses, wages, machinery, etc., $50,000,000, profit to owners $65,000,000. And yet learned Eastern essayists are writing profound theses on the text, "Does mining pay?"

RESERVATION in a mining lease of a lien on "all ore mined," for royalties, is not waived by a provision in the lease contemplating that the ore will be shipped to market before payment of royalty, which is made every three months, and based on the weights as determined by the railroad transporting the ore from the mine. A lessor who reserves such a lien may recover in an action for conversion against the lessee who not only fails to pay royalties, but sells the ore without preserving the lien.

METALLURGISTS and geologists will note with interest the occurrence of a rare mineral recently found near Florence, Ravalli county, Montana, by a prospector. It occurs in small six-sided prisms, and upon analysis proves to be parisite, a carbonate of cerium, with a general formula (CaF)(CeF)Ce(Co3)3, with in this case a part of the cerium replaced by didynium and lanthanium. This is believed to be its first occurrence in the United States. It was first discovered in Colombia, S. A., and has only been found since in Greenland.

WHEN a lode enters an end line of a regularly located mining claim and runs its course lengthwise, nearly parallel with the sides of the claim for the greater part of the length of the claim, the owners of the claim are not deprived of their extra-lateral rights, because the lode crosses a side line before reaching the other end line, but such rights will extend from the end at which the lode enters to a point at which it crosses the side line, whether a new end line is regarded as being drawn at that point or not.

CORUNDUM is composed of the oxide of aluminum (Al_2O^3), but traces of the oxides of other metals are generally present as coloring materials. As in the cases of other minerals of non-metallic luster, the color of corundum varies considerably. Sometimes the mineral is colorless or white, and at other times it is found possessing a blue, pink, red, brown, gray or other color. The relative weight of corundum compared with equal volumes of many other minerals is high. It has a specific gravity of about 4, while feldspar has a specific gravity of from 2.4 to 2 7 and quartz of 2 5 to 2 8.

IT is calculated that air of 99.96 pounds pressure, transported through pipes to such a distance that it loses 10 26 pounds pressure by friction, will still be capable of exerting 96.92% of the power that might have been had if it had been used at full pressure without friction loss; the head is 99 96 pounds, the loss of head is 10 36% and the loss of power 3.38%, the loss of head being more than three times the loss of power. The manifest reason for this is that compressed air as it loses in pressure gains in bulk, and thus, by its increased volume, approximately compensates for the diminished pressure.

FROM the vicinity of Nelson, B. C., a 40% lead ore shipped to the U. S. would pay $12 duty and, say, $8 freight; smelted in B. C. and bullion shipped into this country, the duty would be $16 and the freight, say, $3 20—virtually the same. A 65% lead ore there would cost in duty $19 50 per ton; with $8 freight, that would be $27 50 per ton, shipped to the United States. Were it smelted near the mine, on the resultant lead the same freight rate, sent to this country, would be $5.20; the duty, $26 The problem from the British Columbia standpoint is a difficult one to solve.

THE miners' lien bill now under consideration in the California Legislature is an important measure. Under the present California law (modified by Supreme Court rulings) liens can be filed on a mine for labor performed or material furnished, but only on mines on which mineral land patents have been issued by the Federal Government. Mines on lands patented as agricultural do not come within the scope of the existing law. The proposed amendment is designed to permit the filing of liens on any and all mines and with the further object of simplifying such procedure.

THE California State Mining Bureau and Museum has been moved from the Pioneer building, Fourth street, San Francisco, to the upper northwest half of the new Union Depot at the foot of Market street, where State Mineralogist Cooper and his corps of assistants are finely situated. The Museum room is about 250 feet in length, and, like the offices, laboratory, library, etc, is admirably lighted and arranged. The Bureau is now well housed, with the State for its landlord, the cost of rent, etc., being $130 per month as against $250 in its former quarters. It will be ready for the reception of mining men, and visitors generally, about Feb. 10th.

THE bill relating to "grub-stake contracts," introduced in the California Legislature by a Siskiyou member, sets forth that any contract between individuals whereby one party thereto agrees to furnish all provisions, materials and boats, and the other all labor and prospecting required in prospecting for and discovering mines, shall be known as a "grub-stake contract" The bill makes "grub-stake contracts" void unless a written agreement fully setting forth the contract be made and signed by the parties and recorded in the office of the County Recorder of the county wherein one of the parties resides or where the prospecting is to be done.

AT the Guggenheim Smelting Works at Perth Amboy, N. J., as a final process all the gold slimes are treated with nitric acid in porcelain bowls, steam heated, whence, after several days, the resultant chocolate colored mud is taken to the melting room and refined in a small furnace, borax being used for flux, and cast into bricks. From the residual nitric acid the silver in solution is precipitated by the addition of common salt. The main silver yield, from the tanks, is melted in large retort furnaces, made of graphite. The silver is cast into 1100-ounce bricks, on which a smooth surface is secured by burning sugar thereon, while molten, and briefly excluding the air. The silver output of those works is nearly three tons per day.

IN securing patent to a mineral claim, the first thing to be done is to send to the office of the surveyor general a certified copy of the location notice and $35, this sum being for office fees. That office then authorizes the survey. The applicant makes the financial arrangements with the surveyor. The surveyor makes return to the surveyor general's office of his notes, etc., where the clerks plat the claims and check up the surveys. They then send the applicant two copies of the plat and a copy of the field notes. One copy of the plat he posts up on the claim. The other he files at the land office and makes application to the register for a patent. The application is sent forward from the land office to the commissioner of the general land office, and from this latter office the patent finally issues.

IN the Rand, South Africa, the stamp mills are of the usual Californian pattern, with self-feeders. Their weight used to be 850 to 900 pounds and they used to have a 9-inch drop. The modern mills have 1200-pound stamps and are worked with an 8-inch drop, some of them dropping ninety-two to the minute. The best crush 4½ to 5 tons per twenty-four hours per head, through a 900 mesh screen. The average for the entire district for one month was 3 7 tons crushed per head per twenty-four hours. The batteries have amalgamated copper plates inside them, and the crushed ore is discharged on to copper tables 12 feet long and 6 feet wide, these tables being amalgamated so as to catch the gold. It is found that most of the gold is caught inside the battery, and on the first 3 feet of the outside copper plates. The amount of gold caught on the plates is 55 to 60%—an amount which compares unfavorably with many other plates where the percentage is 80. The amalgam is collected, cleaned in pans and then heated in retorts, mercury driven off and recondensed; the spongy gold so obtained is then melted. The loss of mercury in the entire treatment is about three-fourths ounce per ton of ore; at the Robinson mine it is 0.65 ounce. The melted gold is usually 800 to 825 fine and contains silver, lead, copper and other metals.

Platinum.*

By DAVID T. DAY

Production.—The product of platinum during 1897 in the United States came chiefly from Trinity and Shasta counties, California, and amounted to about 150 ounces, worth in the crude state $900. The production since 1880 has been as follows:

Year.	*Quanti'y, ozs.*	*Value.* (a)
1880	100	$ 400
1881	100	400
1882	200	600
1883	200	600
1884	150	450
1885	250	187
1886	50	100
1887	448	1,838
1888	500	2,000
1889	500	2,000
1890	600	2,500
1891	100	500
1892	80	550
1893	75	517
1894	100	600
1895	150	900
1896	163	944
1897	150	900

(a) The chief variations in price have been due to the quality of the crude grains.

Localities of Occurrence.—During the year '98 a demand has developed for osmium which has greatly stimulated the search for iridosmine, and hence for all the platinum metals, since osmium either in the form of iridosmine or as an impurity in platinum and in platiniridium is almost invariably found where any of the other platinum metals occur. The demand for osmium comes from the Welsbach Light Co. of Philadelphia, who need it for the incandescent lights. It is probable that very much more will be known in the next few months concerning the distribution of the platinum metals on the Pacific slope. In fact, a general search for the platinum metals will be made by this company throughout the United States, Canada, Alaska and South America. On the Pacific slope platinum was noticed by Siliman in the black sand obtained as the heaviest material with the gold in placer mining at Cherokee Flat, Butte county, California. Siliman speaks of it as being plentiful, and the iridosmine more plentiful than platinum, but that the miners have no way to save it. Since then platinum has been noticed on the coast of California as far south as San Bernardino county. All the work done in the search for platinum, including that of the writer during the present summer (1898), tends to strengthen the belief that it occurs only in more or less direct association with placer sands derived from serpentine rocks, and especially those rich in chromite. A glance at the recent geological map of California, in which the occurrence of serpentine rocks and deposits of chromite are noted in colors, will give a fair idea of the distribution of gold-bearing sand in which platinum metals have also been found. Thus, coming north from San Bernardino county, California, platinum has been obtained when washing for gold in the beach sands of the coast near Santa Barbara; again at Lompoc beach; on the beaches of San Luis Obispo county; farther north again in the neighborhood of Santa Cruz; and it has occasionally been found between Santa Cruz and the Golden Gate. But the coast sands which have yielded the platinum metals most prolifically in California are those of Humboldt and Del Norte counties. The beach mines of Gold Bluff, north of Arcata, and the mines at Big Lagoon, Stone Lagoon, Little River, and going north in the neighborhood of Crescent City, and coming inland from there the mines in the neighborhood of Gasquet and Smith River, have furnished considerable amounts of platinum, and would doubtless have furnished more but for the fact that the platinum is extremely fine, making it difficult to separate from iron pyrite, chromite, magnetite and ilmenite. Further, it has contained a discouragingly large amount of iridosmine that is practically valueless; it was too fine for pen points and had no other use.

Going farther north in Oregon, the same conditions concerning the occurrence of platinum along the coast are principally noticeable at Gold Beach and at Port Orford in the Coos bay region. Sharpless and Winchell have carefully examined the sands at Bandon, at the mouth of Rogue river, Oregon, and found platinum almost invariably, although the proportion was smaller than has usually been reported by less careful observers. Thus beach mining for gold, in which platinum has frequently been saved, continues as far north as Yaquina bay, Oregon, and more or less successful efforts have been made to save the platinum associated with fine gold in the black sands of the Pacific beach north of Astoria, Oregon, and still farther north on the beaches of Washington. The saving of platinum from beach sands, however, as indicated below, reached its maximum extent in the mines of Gold Bluff, Crescent City, Gold Beach and Port Orford.

Meanwhile the interior of the State has also furnished platinum from the black sand associated with gold in the placers of the American river, and in Plumas, Shasta and Trinity counties, California. In these counties both gold and platinum have usually been coarser, and thus the platinum has been more easily saved and separated from the finer grains of iridosmine. In fact, the main seat of the platinum industry of the Pacific slope has been in the Hay Fork district of Trinity county and along the Trinity river from Chapman's mine, six miles south of Junction City, northward to North Fork. Here both the large mines and the small Chinese workings have furnished the bulk of the platinum produced in the United States. Nuggets one-quarter of an inch in diameter have very frequently been found. In the Hay Fork district iridium, in the form of platinum iridium or iridosmine, has been a noticeable feature. The region of Grant's Pass, on the Rogue river, Oregon has also furnished small quantities of platinum, and will probably furnish much more in the future.

Much of the general information has been obtained from the records of the California State Mining Bureau, furnished by Prof. Durden and by Mr. Charles G. Yale, but was supplemented by a personal visit of the writer—in company with Col. W. E. Barrows, president of the Welsbach Light Co.—to most of the inland regions which have been described.

By continuing to Portland and examining all the black sands which could be found from various points in Oregon, Idaho and elsewhere, traces of platinum were found in sands at various points on the Snake river from Bakersville to Lewiston, and a specimen of platinum sand was also obtained from Miles City, Montana.

In regard to the conditions of occurrence of platinum in California and Oregon, the general statement that the black sands are richer as one preceeds farther north should be modified. This undoubtedly is true if one considers the coast from San Bernardino through to the northern limit of California, the richest deposit having been found in Del Norte county; and the same conditions continue in Oregon as far as Coos bay, but above this there is no information at hand to show that the black sands farther north are richer in platinum or gold than those farther south, or, indeed, that they are so rich.

For years the region known as the Similkameen district, in British Columbia, has been looked upon as the richest source of platinum in America, and a visit to this point, which is reached most easily by a wagon drive of 120 miles south from Kamloops, British Columbia, on the Canadian Pacific Railroad, was made by Col. Barrows and the writer. It was found that there are large bodies of serpentine containing chromite near the headwaters of Tulameen and Granite branches of the Similkameen river, and below this the sands of both creeks are remarkably rich in the platinum metals.

Platinum has also been found on Slate creek, which empties into the Tulameen river a short distance above Granite creek. This region is particularly interesting because of the characteristics of the platinum grains found there. It is practically easy to determine whether a given nugget of platinum was found on the Similkameen river proper, or whether it came from the region of the Tulameen or Granite creek district. In the latter case the nuggets are usually black and very magnetic, due probably to the fact that they are frequently coated with either magnetite or magnetite and chromite, or with some oxidation product of pyrrhotite. The platinum sand coming from the Similkameen river, on the contrary, is bright, as though the greater part of the coating had been rubbed away. There is every indication that the platinum of Granite creek is in close proximity to the original source. This fact is made particularly evident by the finding of a platinum nugget to which a considerable amount of the mother rock was still attached. This rock proves to be peridotite, mixed with chromite and magnetite. A careful search will be made of the various rocks in the vicinity, with the probability of finding platinum in place.

In regard to the proportion of platinum metals to gold, the only direct evidence was the fact that at the Pogue mine, operated by Mr. T. H. Murphy, about twenty ounces of coarse platinum, the principal nuggets ¼ inch in diameter, were found in mining 100 ounces of gold dust, and this proportion can be taken as perhaps fairly representative of the district, although the proportion must necessarily vary considerably, because not all either of gold or platinum is saved, the fine gold and fine platinum usually being put aside with the black sand to be worked up at some future day. The total output of platinum in the Similkameen district has declined very greatly. In fact, the large output for one or two years, about 1886, was due to a cleanup of various lots of black sand, rich in platinum, which had accumulated for several years. The output of 1897 did not vary considerably from 200 ounces.

Word was received that a considerable proportion of platinum was found with the gold of the Caribou district, 250 miles north of Ashcroft, British Columbia, and Mr. W. Pellew Harvey of Vancouver has found three one-hundredths of an ounce per ton in the unconcentrated sand of the Saskatchawan river, sixty miles up the river from Edmonton, British Columbia. It is said that the Edmonton black sand is regularly purchased for shipment abroad, in order to obtain platinum from it.

Platinum in Russia.†—Platinum is produced only in the Ural, in the mining districts of Perm and Verhotursk. In the following table is shown the production by works in 1896, the last year for which any official figures are available:

Name of mine.	*Production, Troy ounces.*
Goroblagodat	116,980
Nizhne-Tagilski	31,288
Krestovozdvizhenskie	23,635
Nikolaye-Pavdinski	1,573
Bogolovski Mining Co	362
Total	173,838

In 1896, as well as in preceding years, the largest quantity of the output was produced in the Goroblagodat region, viz., 116,980 ounces, or a little over two-thirds of the entire product. Next follow the mines of the Nizhne-Tagilski works with 31,288 ounces, or 18 per cent, and the Krestovozdvizhenskie with an output of 23,635 ounces, or 13½ per cent of the total. Compared with 1895, when the production was 155,646 ounces, the output increased by 18,192 ounces, or nearly 12 per cent, owing principally to the increased demand and good prices paid for the metal.

The production of platinum in Russia during the four latest years for which statistics are obtainable is given in the subjoined table, which also demonstrates that the rank of the producing mines has remained the same:

Mines.	*1893. Ounces.*	*1894. Ounces.*	*1895. Ounces.*	*1896. Ounces.*
Goroblagodat	107,267	108,242	94,045	116,980
Nizhne-Tagilski	44,702	45,625	36,558	31,288
Krestovozdvizhenskie	22,312	23,045	22,091	23,635
All other	5,490	6,752	2,952	1,935
Totals	179,801	183,664	155,646	173,838

The production and value of platinum for a series of years, and also the production of this metal for the twelve years from 1885 to 1896, are given in the two following tables:

Year.	*Production, ounces.*	*Value.*	*Average price per ounce.*
1893	179,801	$1,765,669	$9.83
1894	183,664	1,714,020	9.33
1895	155,646	1,701,623	10.93
1896	173,838	2,085,930	12.00

Year.	*Production, ounces.*
1885	91,944
1886	152,195
1887	155,415
1888	95,799
1889	92,946
1890	100,289
1891	149,365
1892	161,234
1893	179,801
1894	183,664
1895	155,646
1896	173,838
Total, twelve years	1,692,136
Average yearly output	141,011

The year 1894 represents the greatest quantity of platinum obtained in any one year. Of this amount (183,664 ounces) 181,029 ounces of platinum were washed out of 1,833,219 short tons of platinum-bearing sand, while the remaining 2635 ounces were washed out of gold-bearing sand. In 1895 there were washed 1,728,816 short tons of platinum-bearing sand, yielding 154.862 ounces of platinum, besides a small amount (794 ounces) obtained from gold-bearing sand.

Establishments for Refining Platinum.—The crude platinum obtained from the mines, before being put to use, is subjected to a refining process. This is done in various establishments, but mainly in foreign ones, and consequently a large part of the metal produced is exported in the crude state over the frontier. In Russia there exist only two establishments refining platinum, the Tentelevski Chemical Works and the laboratory of Kolbe & Lindfors. Both are located at St. Petersburg, and are under the supervision of the mining department. The former of these establishments in 1896 purchased 1343 ounces of the crude platinum, from which 1114 ounces of pure metal were produced. The Kolbe & Lindfors laboratory in 1896 neither bought nor refined any platinum.

Two new companies were formed in 1896 for the production of gold, platinum and associated metals.

Osmium-Iridium.—This metal is obtained from only one locality, the Miasski gold mine, in the government of Orenburg. The production for the last three years for which any information can be obtained is given in the following table:

Year.	*Production, ounces.*
1894	125
1895	159
1896	224

The production in 1896 shows an increase over that of 1895 of sixty-five ounces, or nearly 40 per cent.

†Authority: Sbornik Statisticheskyh Svyedyenii o Gornozavodskoi promyshlennosti, Rossii 1894 i 1895, Otchet Gornava Departmenta za 1896 goda, St. Petersburg, 1897.

Some Needed Aids to Development of Mines.

Written for the MINING AND SCIENTIFIC PRESS by JOHN W. GRAY.

Those who heighten the public weal are public benefactors. The men who increase the commonwealth and develop for others self-sustaining opportunities, benefit mankind much, and those who do this in a manner which does not impoverish their fellows and render it more difficult to earn one's bread, benefit the world most.

As this is true of individuals, so it is true of the industries which offer the field for such work. The mining industry stands pre-eminent in this regard, and so the industry itself, and those engaged in it, should be looked upon with special favor. Yet the present splendid development of the industry in our own country has been brought about by greater efforts and harder struggles than have even been needed in the industries of lesser possibilities, and with less of aid and encouragement from the individual, State and Government, notwithstanding the fact that from no other industry does the country at large receive more direct and substantial advantage, and the further fact that there is no other industry of more brilliant promise, or the complete development of which offers such general benefit.

In former times, the industry of mining was looked upon as the noblest of all, and those engaged in it were regarded with distinction, enjoyed the favor of high and low alike, and were the recipients of substantial governmental aid in the pursuit of their calling. In many other lands to-day, the industry of mining receives high attention and fostering care, and aids to its full development are being constantly conceded. Our own people and country have been backward in this regard, but when the good results sure to follow all aid and attention which may be bestowed upon the industry are better known, all classes of people and all manner of men will unite to see that mining receives its just due, and that the industry shall occupy that proud distinction among the pursuits of man which rightly is hers.

Probably the three things most needed to fully develop the industry of mining in our western country are cheap power, easy and economical transportation and low reduction charges. Money is always, of course, needed, but this would come with the others, since credit is usually obtained when sought in connection with business based upon the elements of success.

To-day, money is put into our mines in large sums chiefly, and few properties are considered of importance which do not afford opportunities for extended operations. Much of the money is foreign, and most of the profits from such enterprises are paid to foreign residents. All of this is well enough, perhaps, but the full and complete development of the mining industry will not be brought about by such means.

If capital were to be expended in constructing railroads and common economical transportation lines throughout the mining regions, in providing cheap power at all mines, however small, and in establishing central metallurgical plants to which all roads should converge, it would no doubt receive satisfactory profit, and would tend to vastly increase and sustain the public prosperity. There are thousands of mines producing ores easily concentrated or otherwise put into shape for the reduction works which, under the conditions mentioned, could and would be profitable worked in a small way, producing in the aggregate vast amounts of ore, and affording to the workers permanent, agreeable and independent occupation. Such mining as this means the true development of the industry. It is applicable alike to all kinds of mining. It means the creation of a mining class, owners and wage earners in their own claims, with as great independence and greater chances of regular profit, than the farming class. It means the establishment of permanent and prosperous mining communities. It means the creation of the most profitable markets possible for all classes of producers. It means a considerable increase in the general prosperity of the State, since it brings about increase of population and production of wealth. It means the raising of the miner to a higher level, and the creation of a class which, by personal force and intelligence, will ultimately develop nature's vast fields of riches along the lines intended by the Creator, and to the utmost benefit of all. It means too many good things to be included within the compass of a short article, but which will suggest themselves to the thoughtful man.

In a small way, in some parts of the world, the mining industry has been thus developed, and nowhere do more prosperous or generally beneficial communities exist.

That the final development of mining must come about in some such manner, would seem necessary, since the vast majority of mines can only be so worked, paying permanent and satisfactory wages to the owners, offering no field for capital save in the manner pointed out, but nevertheless affording the most satisfactory conditions for the employment of both capital and labor.

Great aid to the full development of mining will be given by raising the general intelligence and increasing the skill of all the workers in the various occupations included in the mining industry, and we now come to a most important and necessary factor in the final development of all industrial pursuits—that of the education and training of the worker.

At no time in the history of the world has so much attention been given to the subject of general education as is now being given thereto. Millions upon millions of dollars are being poured into the already overcharged coffers of our various universities for the extension and advancement of these institutions. Suppose, now, that some of these millions could be applied to undertakings more especially adapted to the education of what is termed the "workingman" and to increasing the skill and intelligence of that great army of men who are to-day making possible the brilliant achievements of the present time. Other nations are doing much in this direction, but our boasted American civilization has as yet done but little.

An area of country in one of our best and most attractive mining counties could be secured, containing all the natural elements necessary for splendid success along the lines outlined. Here a great practical school of mining, metallurgy, electricity and the various mechanical arts could be established, affording to the manly and ambitious youth of all countries opportunities greatly to be prized, and now entirely denied to them. A town could be established, power developed, the necessary metallurgical and mechanical plants constructed, and those attending the various departments of the great school could be employed in labor, as well as study. Such an institution, by working its own mines and other industrial departments, would be largely self-sustaining, without in any way interfering with private enterprise, and the students, by giving half their time to labor, might be able to cover for themselves the cost of such an education as is at present beyond the reach of all.

The possibilities of such a great school are manifest. It would attract the best youth of our land, and of many lands, and would in no long time become known throughout the world and be a source of pride and pleasure to all who love the goodness and greatness of modern Americanism.

There is no spot so suitable as California for such a school, and its successful establishment would be a monument to the goodness of its founders and the State whose aid and care will foster it. From such a school the youth of all lands would go forth, with hands trained to American skill, arms strung with American energy and spirits full of American pluck, to play a mighty part in the great industrial evolution of the future and in the development of many lands, whose resources now lie, in great measure, undisturbed and dormant.

From this great practical school it will be but a step to our famous universities, in which institutions it will be possible to pursue the studies already well begun, and to carry out experiment and research to the utmost point desired. Thus the field would be doubly open, first for those seeking industrial training and skill with the necessary learning, and, second, for those desiring to enter the field of higher education and devote themselves to the branches of research and investigation.

Here is an opportunity for philanthropists to do great good to a great many, an opportunity for the practical solution of some of the many questions now seemingly so to puzzle the good but theorizing political economists, and an opportunity for the business interests of the country to aid in an undertaking which would, after a time, do more to extend and increase the trade and commerce of the land than any equal expenditure in other channels.

California-Built Japanese Cruiser.

The first war vessel ever built in the United States for a foreign Government is the protected cruiser Chitose, built by the Union Iron Works of San Francisco for the Japanese Government, and which has successfully completed an official six hours' trial trip in Santa Barbara channel, averaging 21.48 knots per hour, when but 20.5 were required, and developing a speed of 21.38 knots under natural draught.

The upper part of the engraving on page 85 shows her lines and general appearance as completed; the lower part is a deck plan. She is technically known as a second-class, high-speed, unarmored, protected cruiser, is 405 feet 2 inches in length, 49 feet breadth, 17 feet 7¼ inches draft, 4760 tons burthen. Engines triple expansion, twin-screw propellers, four double-ended and four single-ended boilers 14 feet 3 inches diameter. The armament consists of two 8-inch 45-caliber quick-firing guns and twelve 12-centimeter guns, twelve 12-pound guns, and six 47-millimeter quick-firing guns; there will also be five torpedo launching tubes, one 14-inch fixed and four 14-inch training. She has a Japanese crew of 182 men, and, under Commander L. Mori, will next week start across the Pacific to Japan.

Some Modifications of the Cyanide Process.

Translated for the MINING AND SCIENTIFIC PRESS.

The following are brief abstracts of descriptions of modifications of the cyanide process, proposed by European workers and published in foreign journals. It is believed that no sufficiently full description of either of them has so far appeared in America.

1.—The Pape-Henneberg and Goepner-Diehl Combination Process.—This process was described in an Austrian paper by Dr. C. Blomeke. Pape and Henneberg devised a method of dry crushing and concentrating by the application of centrifugal force and air-currents, while in British patent No. 17,793 of 1896 and U. S. patent No. 580,683 Goepner and Diehl claim to precipitate gold and silver from dilute solutions by adding cyanide of silver or copper and then acidulating.

After suitable pulverization the ore is treated on a centrifugal separator with an air-current produced by an exhausting fan, yielding six grades of material, the four finer suitable for leaching, the other two for amalgamation: (1) heavy sand, (2) medium sand, (3) fine sand, (4) coarse dust, (5) fine dust, (6) floating dust, corresponding to slimes.

The advantages claimed for dry separation are: 1—The dust (slimes) is easily separated and collected, as is not the case with spitzkasten, etc. 2—The "percolation products" are looser, freer leaching, so causing less absorption and higher gold extraction. 3—Much less water is required. 4—Dry-separated products can be treated at once by chemical processes, those got in the wet way requiring twenty-four hours' drainage. 5—Apparatus for dry work takes up much less space than spitzkasten, etc., and necessitates a less outlay. 6—The cost of gold extraction is less by the dry way for refractory and low-grade ores.

Goepner and Diehl's extraction process consists essentially in (1) leaching the ore with a solution of pure potassium cyanide, such as is always employed, but with the addition of some secret ingredients; (2) in the removal of the auriferous solution from the residue by filter presses; (3) in the precipitation of the gold by sulphuric acid in place of the zinc commonly used. For the latter purpose an excess of copper cyanide is added to the solution and then sulphuric acid which precipitates the cyanides of copper and gold. After this has settled the solution is removed and made alkaline again by means of soda lye; upon adding a little more cyanide it is ready for further use.

The copper-gold-cyanide precipitate is redissolved in fresh gold-carrying solution and then thrown down again by more acid, and so on, whereby a continual enrichment of the precipitate takes place. When this enrichment has gone far enough the precipitate is dried in filter presses, and redissolved in fresh potassium cyanide solution, from which the gold is precipitated by electrolysis while the copper cyanide remains and can be used again.

As high as 95 per cent extractions have been made by this process, both by percolation and with slimes; in the latter case the filter press is used and removes the solution very completely from the residue.

Detailed accounts are given by Dr. Blomeke of experiments on 500 to 2000-pound lots of ore from West Australian and South African mines.

2.—Netto's Process.—In June, 1896, Don Cesar Rubio published in the *Revista Minera* of Cartagena, Spain, an account of an improved cyanide process for the extraction of gold and silver from ores, the invention of Max Netto, a foreign chemical engineer resident in Spain. (1) The solution of these metals is effected by the action of aqueous KCN in the manner common to the MacArthur-Forrest and Siemens-Halske processes, (sulphides and "dry" ores being preferably first roasted with the addition of a little salt), the solution containing from 0.5 to 0.8 per cent; this is run on at intervals so that air is carried down with it, and is followed by a water wash after four to eighteen hours' contact. (2) Precipitation of the silver is effected by acidulating with hydrochloric acid which throws down AgCl (mixed, though the author omits to mention it, with more or less AgCN) which is filtered or decanted off, the KCN being at the same time decomposed with formation of free hydrocyanic acid. (3) The gold is obtained by electrolyzing the acid solution, some Cl being set free at the same time; the cathode is a gold sheet and the anode of carbon. (4) Regeneration of the alkaline cyanide is effected by adding soda or potash to the solution in the proportion calculated to combine the free HCN and form KCN or NaCN.

The leaching is carried on in cement tanks, the rest of the process in wooden vats.

According to Senor Rubio this procedure has the advantage of forming no prejudicial compounds like the MacArthur-Forrest system, and losing no appreciable amount of cyanogen as with the Siemens method, only about 3 per cent of the total being lost.

In the *Berg und Huettenmaennische Zeitung* of October 15th, 1897, C. A. Hering discussed this method favorably, pointing out that the Cl set free at one stage will react at another stage to form cyanogen

chloride (CyCl) which makes the solvent more effective when subsequently used, another advantage being the production of gold and silver nearly free from one another. In one case quoted an ore, carrying about one ounce gold and twelve ounces silver (as sulphantimonide) per ton, yielded 92 per cent of its value at a cost of about $5.50 per ton, a preliminary roasting being necessary in this particular case.

In the same journal Messrs. Witter and Zuschlag criticized Netto's claims, stating that the process, though it appeared continuous and satisfactory on paper, went on differently in practice.

Their experiments were carried on for a year and a half, while they were engaged in testing the adaptability of some forty ores to the Pape–Henneberg process already described, the coarse gold having been removed from these ores before cyaniding.

The solutions from these experiments were precipitated by the method of Prof. Christy or Prof. De Wilde* (addition of copper sulphate, sulphurous and sulphuric acids), and the gold and silver thus precipitated were estimated by cupellation. Larger quantities, from tests on one-fourth to ten tons were treated by the precipitation process of Goepner–Diehl (copper or silver cyanide followed by acid).

It was thereby shown that gold potassium cyanide solution, if it carries silver, needs no addition of cuprous salts; the gold and silver fall out almost completely on acidulation with either sulphuric or hydrochloric acid. If solutions stronger in KCN are acidified with sulphuric acid, 2 to 4 grams of gold per cubic meter ($1 20 to $2 40 per ton) remain in solution, as against 1 to 1 5 grams (60 to 90 cents per ton) with hydrochloric acid, the original liquor carrying 20 to 100 grams per cubic meter ($12 to $60 per ton). The retention of these small amounts of gold results apparently from formation of aurocyanhydric acid ($HAuCy_2$) which breaks up at 50° C. (120° F), if heated to that temperature the gold falls out quantitatively.

They therefore prefer to add to such solutions as carry gold only, some previously obtained gold-silver precipitate, stir, and acidulate. In laboratory experiments copper chloride or silver nitrate was added to the auriferous solution and then acid, this removed the gold quantitatively. Silver-bearing solutions naturally needed no such addition before acidulating.

These writers cite the results of their hundreds of experiments in disproof of Netto's claim that his process yields the gold free from silver and silver free from gold.

In a still later number of the same journal (Dec. 24, 1897), Max Netto writes in defence of his claims, premising that no extraction process is universally applicable, and that the cyanide process especially is best adapted to low-grade ores and mill tailings. The solutions experimented on by Messrs. Witter and Zuschlag ($12 to $60 per ton) are much richer than those met in ordinary practice. As an instance he estimates that the average Transvaal ore should give a solution carrying about 11 grams per cubic meter ($6 60 per ton) and the tailings and low-grade ores still poorer solutions. He considers about $6 per ton about as high as is to be ordinarily expected in working solutions. If a solution of this value is acidified with HCl, at the ordinary temperature, Netto states that the precipitated AgCl (whether in large or small proportion) contains only traces of gold, the gold all remaining in solution; with solutions richer in gold and at higher temperatures the amount of gold removed increases irregularly, irrespective of the presence of silver. But, as any heating is avoided on account of the great cost, it is to be regarded as a favorable circumstance that the Netto continuous process goes on best at the ordinary temperature. The correctness of these claims was proven by Netto's extensive researches in 1893 94, since confirmed in other laboratories, including that of H. Roscher at Hoboken-les-Anvers.

*An account of these methods of precipitation may be found in Prof. Christy's paper on "Solution and Precipitation of the Cyanide of Gold," pages 20 to 22 and page 36, or in the MINING AND SCIENTIFIC PRESS of Jan. 9th and Feb. 6th, '97. De Wilde's method was recommended at a recent meeting of the South African Chemical and Metallurgical Society as giving an absolutely complete precipitation of gold for laboratory purposes, though it was condemned as a metallurgical process.

Reciprocity on This Side.

That native-born citizens of the Dominion of Canada shall be accorded in said district of Alaska the same mining rights and privileges accorded to citizens of the United States in British Columbia and the Northwest Territory by the laws of the Dominion of Canada or the local laws, rules and regulations; but no greater rights shall be thus accorded than citizens of the United States or persons who have declared their intention to become such may enjoy in said district of Alaska; and the Secretary of the Interior shall from time to time promulgate and enforce rules and regulations to carry this provision into effect.—U. S. Public Bill No. 39, Sec. 13; approved by Congress, May 14th, '98.

ELECTRICITY and electric machinery have 48 000 square feet in the United States exhibit at the Paris Exposition in 1900. None too much.

Existing Conditions in the Klondike.

Written for the MINING AND SCIENTIFIC PRESS.

This is no place for a poor man, but a good country for large capital properly directed. The country from the Hootalinqua to the Koyukuk—1000 miles—is almost blanketed with low-grade gravel, that is, low grade for present methods, but high grade for larger operations.

The rush here was based on the expectation of finding other El Dorado or Bonanza creeks. El Dorado, Bonanza and Hunker, which is also a good creek, were discovered and located at the same time in 1896. Since then, with 4000 prospectors coming in in 1897 and 40,000 coming in in 1898, and scouring the country, not only all about the Klondike, but all up and down the Yukon, not another rich creek has been discovered, so far as proved. Of course, Dominion promises well; so does Sulphur, and lately great reports come from Thistle creek, which come into the Yukon on the right bank 100 miles above Dawson. But none of these creeks have been proved up.

The most important development made has been in the bench claims along El Dorado, Bonanza, Hunker and Dominion. The richest bench claims, generally speaking, are above, or nearly above, the richest creek claims. These benches during the past summer produced $2,000,000 or $3,000,000, and will produce much more this winter and next summer. Only the rim of the benches has been prospected, but the indications are that they contain much more gold than do the creek beds. They are, however, contiguous only to the rich claims of the richer creeks, so that their development means only the proof that El Dorado, Bonanza and perhaps two or three other creeks will produce more than has been estimated.

All these rich claims are already coming into the hands of capital, and the late arrivals are working "lays" on creeks so far not proven. They always find gold enough to prove that the creeks will pay to work by cheaper methods, but hardly wages now. Out of 18,000 claims now located in this neighborhood not over 300 have been proved rich enough to return their owners more than good wages.

The whole country will in time be worked by cheaper methods—modifications of hydraulic mining—and the output will be immense, probably as great as from any country in the world.

This applies to the country all along the Yukon, down through Alaska as far as Rampart City and beyond. In Alaska the miner is not robbed by the Government, gets larger claims, pays less for supplies; generally speaking the mines are more easily worked and are as good as here, excepting, of course, El Dorado and Bonanza. I would advise the miner who knows his business to try Alaska. I do not think that this winter will show up another rich creek unless it be Thistle or some other new one. Since the Klondike excitement started you have heard of dozens of creeks proved as rich as El Dorado, according to reports, but that is all nonsense. Less than 40 claims on El Dorado, less than 100 on Bonanza and about 40 on Hunker will return their owners small or large fortunes. Nothing else has been proved rich, although thousands of shafts have been sunk. Dominion and Sulphur will, I have no doubt, show up well; but they have not been proved yet. So, you see, the whole rumpus is caused by these El Dorado claims. Bonanza does not compare with them. El Dorado is great. A dozen of the El Dorado claims will yield a million each, and probably more of them. Then, the benches on French hill and Skookum and Gold hill are marvels. They are not prospected yet, but are turning out very rich pay. But when you leave that little strip along El Dorado and Bonanza you find nothing great so far as proved. Certainly nothing as good or better than the Alaska mines at Birch creek or in the Forty Mile country has been found off El Dorado and Bonanza. Birch Creek and Forty Mile districts, and others along the Yukon in Alaska, are being exploited this winter by nearly 10,000 miners, and many of them are working diggings that have for years been known to be worth at least wages, and many new creeks are reported to prospect very well. Several thousand men are on the Koyukuk. Supplies in Alaska are comparatively plentiful and well distributed, and cheaper than at Dawson. So the outlook for good returns there is the best. Then it may be said that a larger proportion of the men in Alaska are real miners, and not rainbow chasers.

Dawson City, Nov. 11th, '98.

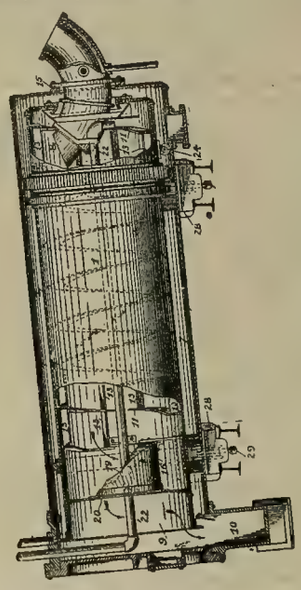
THE advertiser in a trade journal is mainly one who offers some commodity or service to persons engaged in a particular trade. The circulation of the paper represents a class of people, every one of whom can be considered and addressed as a possible patron. That they are intelligent above the human average is certain, or they would not take a paper devoted to one topic. And that they are worth addressing is equally sure, for each one must be an interested reader of the trade advertisement addressed to the trade. It is not an exaggeration to say that every 1000 of circulation in a trade paper is worth to any advertiser in the trade concerned any 10,000 or more of circulation in a paper addressing the general public.

Latest Mining and Metallurgical Patents.

Patents Issued January 17, 1899.

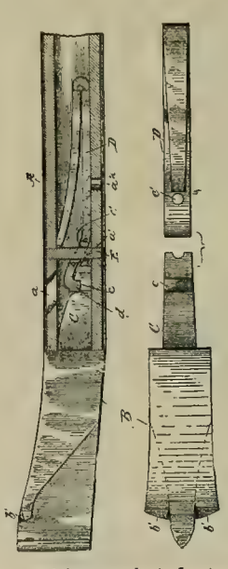
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

EXTRACTING AND REFINING ASPHALT.—No. 617,712; A. F. L. Bell, Carpenteria, Cal.



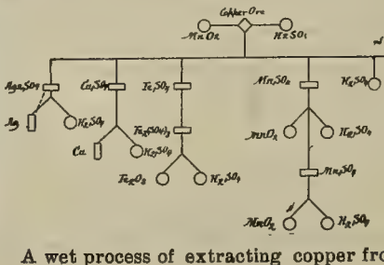
A revoluble mixing cylinder inclosed within and open to an inclosing vapor-tight casing, the ends of the cylinder having openings equal to about one-third of its diameter, through which the asphaltic material is received and discharged; at one end is a sealed inlet way for the asphaltic material, at the other end discharging scoops attached to and revolving with the mixing cylinder to raise and discharge the insoluble matter, the scoop being provided with perforations or a screen at its bottom so the free liquid solution or solvent can drain back and remain in the mixing vessel.

ROCK DRILL.—No. 617,795; O. G. Worsley, Newark, Ill.



A combination with a socketed stock having its end faced to receive the impact of the drill bit and a drill bit having a shoulder for bearing against the stock end, one of such bearing surfaces being oblique to the axis of the member of which it forms a part, with a shank for the bit adapted to enter the socket of the stock and to have a lateral movement at its inner end, and a spring bearing laterally against the shank, whereby the bit is caused to extend beyond the line of the periphery of the stock.

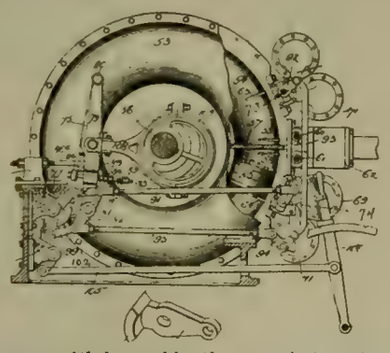
EXTRACTION OF METALLIC ORES.—No. 617,911; E. A. Smith & M H. Lyng, Anaconda, Mont.



A wet process of extracting copper from its ores

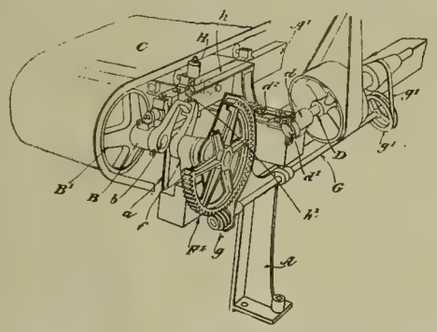
having precious metal therein, consisting in digesting the pulverized ore under action of heat and an oxidizing agent, in presence of sulphuric acid, exposing the dissolved sulphates to metallic copper for precipitation of the silver, treating the filtrate electrolytically to deposit the copper, evaporating the lean electrolyte to concentrate the free acid and crystallize the metallic sulphates, and finally calcining such crystallized sulphates to properly regenerate them as oxidizing agents for refuse.

ENGINE.—No. 617,807; W. S. Colwell, Chicago, Ill.



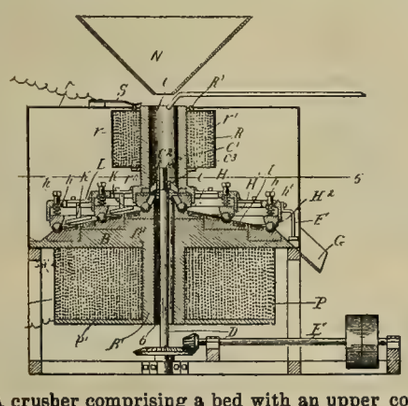
A motor with in combination an abutment, a piston, a continuous piston way having an exhaust port at each side of abutment, a vacuum chamber, a valve housing having communication therewith and with each exhaust port and provided with an exhaust-discharge passage, a valve in each housing adapted to place either exhaust port, in communication with vacuum chamber and exhaust-discharge passage alternately, a floating lever, a pivotal support or standard having limited oscillation, pivotally and elastically connected to lever; a second lever pivoted to first lever and having its ends provided with pivotal operative connection with the valves respectively, means for holding either end of second lever inactive while the other end oscillates, and means for admitting pressure to the piston way at either side of the abutment.

VANNER.—No. 617,953; C. L. Carman, Chicago, Ill.



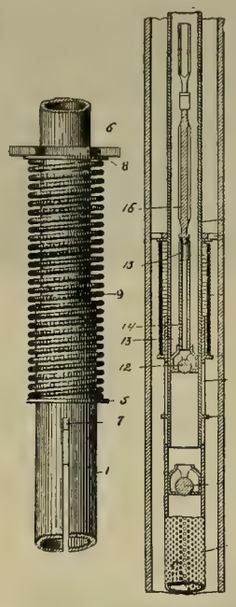
An ore vanner, a combination of a rotatable driving drum having an ore belt mounted thereon, means for vibrating the drum and ore belt transversely, a crank arm rigidly mounted on the projecting end of the driving drum spindle and having a right angular projecting lug thereon for rotating the driving drum, an independent intermediate driving shaft arranged in line with the axis of the driving drum and provided with a crank arm at its inner end having a radial face engaging with the projecting lug of the first-named crank, means for rotating the intermediate driving shaft, and an oil cup or reservoir provided with a flexible projection arranged to be contacted by one of the dogs during their rotations so as to lubricate the engaging faces of the crank arms.

ORE CRUSHER.—No. 617,781; C. Skinner, Chicago, Ill.



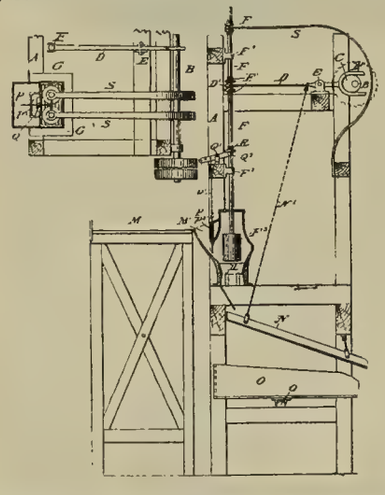
A crusher comprising a bed with an upper conical face provided with a series of concentric annular grooves which form ball racesgor tracks; a number of sets of balls of each set working in one of the races or tracks thus formed; a rotary head supported above the bed face and arranged for vertical shift or self-adjustment relatively thereto and provided with a central feed opening which leads to the central portion of the bed face; an annular groove arranged above the innermost groove and a series of concentrically disposed annular bearings having their lower faces grooved so as to provide an upper series of concentric annular ball races or tracks which lie respectively opposite to the races or tracks provided by the bed and upon the sets of balls working therein, and also having with the rotary head sliding connections adapted to permit their rise and fall relatively to the rotary head and independently of one another. The crusher has one or more sets of iron crushing balls susceptible to magnetic influence; a couple of relatively rotary crushing members providing one or more pairs of oppositely arranged races or tracks between which the set of balls can work, one constructed of iron and a magnet attracting both the iron balls and the races or tracks of the magnetically susceptible crushing member toward the races of the other member.

PUMPING OIL WELLS.—No. 617,770; G. H. Purdy, Wittens, O.



In combination with the tubing of an oil well and the like, an anchor provided with longitudinal slots, an external flange formed on anchor above the slots, a working barrel operating within anchor, lugs formed on the lower end of working barrel and engaging the slots in the anchor, an external flange formed on working barrel, a spring operating between said flanges and means engaging the tubing whereby the same is kept in alinement throughout its entire length.

DRY ORE STAMP.—No. 617,824; M. Weber, Adelaide, South Australia.



Composed of the stamp proper with stamper-box G having slots G', foundation blocks J, J', J^2, and rocking bars H, a hopper M', an automatically supply-regulating slide door P arranged within the hopper and provided with protecting cover plate P^2, chain P', T-ended lever Q with head Q^2 working upon fulcrum Q and alternately actuating collars R carried by the stamp stems, inclined sieve below the stamper-box; the combination of eccentrics C mounted upon the driving shaft B, a stamp rod-actuating spring lever D supported by fulcrum E and provided with forked end D' and engaging the stamp rod between collars F' and a stamp rod counterbalancing spring S secured with one end to the frame and engaging with the other the stamp rod near its top between collars F^4, F^4, and the stamp rod and stamp.

Valuable Flue Dust.

During the week the great flues leading to the sky-scraping smoke stacks at the smelters have been undergoing their quarterly clean-up. It has been the custom to scrape these flues out every three months, but in the future this work will not be done so frequently, or to be more correct it will be done more frequently, but not under the present method.

When flue cleaning time arrives it has been necessary to close down work and allow the furnaces to cool off. Recently the Anaconda Company constructed three tunnels leading to different points in the flues. These tunnels lead into large chambers which are supposed to and do catch the flue dust. To what extent this dust escapes will be determined by the present clean-up. Since the construction of the tunnels, flue dust has been taken out of the chambers about every other day. It is loaded into cars slid down a track running parallel with the flues.

There are two flues at the upper works and three at the lower works. That it pays to clean them out may be judged from the fact that each flue produces about 3000 tons of dust containing about 12% copper. This is an item of at least $48,000 in copper saved from each flue, not taking into account the gold and silver. After the fumes pass the long flues, but little dust goes up the perpendicular stack. Under the old system the saving of this dust has been quite an expensive task. The men who work in the flues have to be well paid and while the work was in progress the smelters had to be idle. It has been found that the negroes can work better in the flues than any other men. The number of negroes employed at the smelters has been gradually increasing because they can work in the hottest places better than white men. The great disadvantage with the colored man, however, is that he is very unreliable and when he goes off shift it is no sure thing that he will report for duty the next day.—Anaconda, Montana, Recorder.

Liquefied Hydrogen.

In London this week Professor Dewar at the Royal Institution described the most volatile of gases when reduced to the coldest substance ever known. When pure it is a colorless, transparent liquid, with considerable refracting power. It is not a conductor of electricity. Its density is very deceptive. At first he thought it might be half that of water, but by measuring a given volume and ascertaining how much gas it produced he found its density to be only one-fourteenth that of water, or six times less than that of the lightest liquid hitherto known. One litre weighed only seventy grammes. It instantly froze and solidified air and oxygen, and hence enabled the density of those two solids to be ascertained. A little ball cooled in it and exposed to the air was first covered with a coat of solid air, and then began to drip liquid air. A piece of cotton wool soaked in it appeared to be magnetic, but the liquid itself, Professor Dewar is satisfied, is not magnetic. This phenomena must, therefore, be due to the cotton being immediately filled with solid oxygen, which is highly magnetic. Professor Dewar explained how vacuums of high tenuity were easily obtained by immersing a closed tube in liquid hydrogen. The air in the tube was immediately solidified, and if the tube was so arranged that the portion containing an accumulation of solid air could be sealed up, the other part had, according to Sir William Cooke's calculation, a pressure amounting to only one ten-millionth of an atmosphere. With vacuum vessels for use with hydrogen it was therefore not necessary to pump out the air.

An Important Yukon Decision.

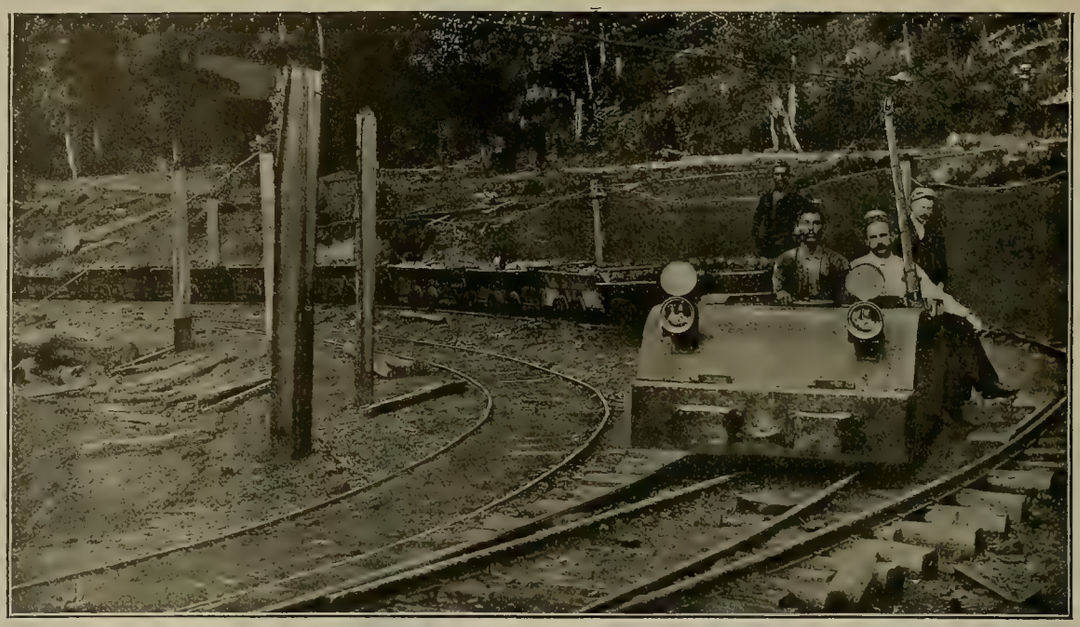
The Yukon appeal of Donelly vs. Nelson has attracted much attention and comment owing to the importance of the legal principles settled by the decision of the Canadian Minister of the Interior. He holds that the sworn application filed by the applicant for a mining claim upon which a mining certificate issues, raises a prima facie case in favor of the holder of the certificate in any proceedings which may be taken by any other person asserting title, and that it lies on the other person to disprove the truth of the statements contained in the application. He further holds that upon a staking according to the regulations, a possessory title to the claim at once vests in the staker, and that during the period within which the staker may obtain his certificate a staking of the claim by any other person is absolutely null and void and that such person is a trespasser ab initio. Owing to the importance of the case the Minister of the Interior requested two of his colleagues, the Minister of Justice and the Secretary of State, to assist him in hearing and determining the appeal. The claim in dispute is valued at over $100,000 and the respondent's title thereto is affirmed by the decision.

Electric Motors for Mine Haulage.

The upper illustration on this page is of the Jeffrey D. M. 60 electric locomotive, as built by the Jeffrey Mfg. Co., Columbus, O., with a train of loaded cars coming from the mines of the Corona Coke & Coal Co., Corona, Ala. The lower cut is one of a S. M. 10 electric locomotive built by the same concern, this type being designed for use especially around smelters and mills. The center cut represents a Jeffrey T. M. 110 electric locomotive.

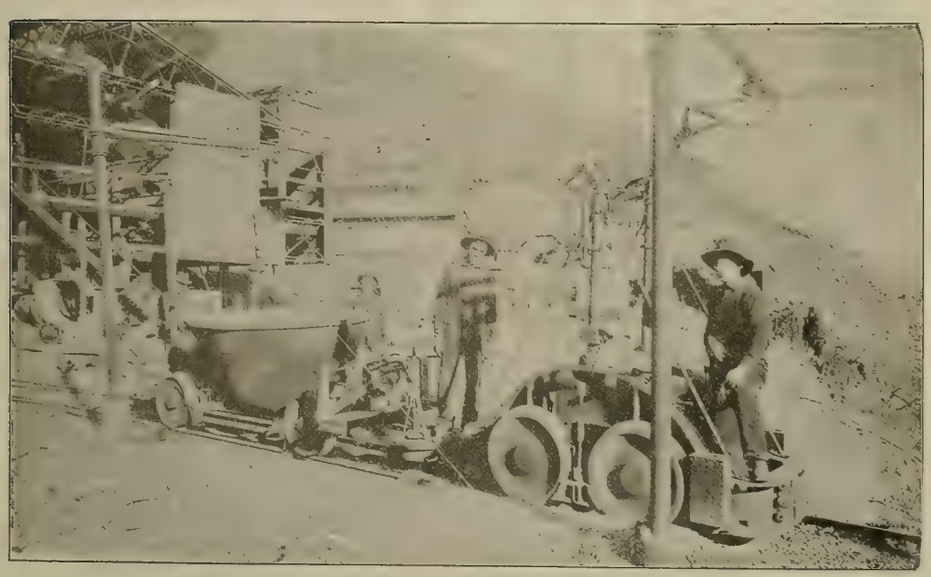
The first electric locomotives used in connection with mine work were very light, but the manufacturer has been building them heavier and heavier each year, as the work they were called upon to do was increased. Mines where these lighter locomotives were originally installed have advanced farther into the veins, and, with increased distance and output, something heavier was required. The locomotive shown in the central cut is a distinctively new type and is claimed by its makers to be the heaviest and most powerful electric locomotive for mine and surface haulage which has ever been built and put in successful operation. It weighs fifteen tons and is noticeably compact. The distribution of weight in the design of a locomotive largely determines the size of rail upon which it is necessary to operate it and affects the cost of track. Few mines are equipped with rails weighing more than thirty-five pounds to the yard. When the weight of the locomotive is distributed uniformly on its drivers and the number of drivers is sufficient to insure a comparatively small total weight upon each, the wear and tear upon the track is minimized. In all the heavier locomotives built heretofore it has been the custom to use four drivers, but in the T. M. 110 Jeffrey electric locomotive three sets of wheels and axles are used, making six drivers in all, upon which is distributed the weight of the locomotive, each driver being thus required to carry only one-sixth of the weight. The frame of the locomotive is mounted on equalizing springs arranged on the four-point suspension system. The method of spring suspension allows adjustment of the wheels to the irregularities in the track. By this arrangement a proportionate amount of the weight is at all times distributed upon each driver, with consequent obtainance of continuous maximum tractive force. By reason of the middle axle being fitted with smooth-faced drivers, instead of flanged wheels, it is possible to operate this form of locomotive on tracks where curves of small radius are frequently encountered. On each one of the three axles is mounted a motor of proper size and capacity, and by thus distributing the power among three motors, a locomotive of much narrower gauge can be supplied without sacrificing either efficiency or simplicity. It would be easy to build powerful motors for electric locomotives were such locomotives operated on standard gauges of track, but a mine track is narrower. The motors of the machine referred to are of the multipolar, iron-clad type, completely enclosed and fully protected by the motor casing. They are waterproof and adapted to this class of work. The controlling mechanism is a device which admits of the starting of a loaded train at a uniform acceleration without jerking. In connection with the controller is a series-parallel switch which admits of the motors being run either in series or parallel, according to the speed at which it is desired to move the load. All these parts, together with a reversing switch and sand-box levers, are so located that the operator can handle them without difficulty, he being seated in the center of the car between the axles, where he is fully protected from injury in case of accident. The trolley pole can be located on either side of the frame of the locomotive. The sand-boxes are cast in the frame, and the supply of sand can be regulated by a positive motion operated by levers. The brake is of the automatically-locking, equalizing-screw type, of such strength that the drivers can be slipped, if necessary. The top of the locomotive is covered over its entire surface, save the operator's seat, so that water dripping from the mine roof, or falls of other foreign substances, cannot drop into the working parts. This whole top is so hinged that it can be easily removed when it is necessary to gain access to any of the motors, gears or other parts of the machine. There are only three pinions and three split gears on the machine.

The Jeffrey Mfg. Co. have recently gotten out a handsome catalogue, in which they show cuts and descriptions of their locomotives, which will be mailed to any address upon application to the Jeffrey Mfg. Co., Columbus, Ohio, or Denver, Colo.



JEFFREY ELECTRIC MOTOR CAR FOR MINE HAULAGE.

JEFFREY T. M. 110 ELECTRIC LOCOMOTIVE.



SPECIAL MOTOR CAR FOR HANDLING SLAG CARS IN SMELTING WORKS.

Grade of Battery Plates, Water Supply, Etc.

To the Editor:—Referring to the inquiry of Mr. T. J. Bell, in your issue of Jan. 14th, the writer, if permitted, would suggest that the grade of the plates should be increased to not less than 1½ inches to 1 foot, if the ore is free from sulphurets or other heavy material, and to not less than 2 inches if carrying sulphurets.

The water supply should be just sufficient to keep the pulp from banking at any point on the plates, and no more.

In regard to the mercury draining off the plates, the writer knows by experience how difficult it is to learn to keep the plates dry, as is necessary when warm water is used.

One must resolve to throw aside experience previously gained and learn it anew, and will be surprised to find how much harder the plates may be safely run than with water at ordinary temperatures. Millman.

Baker City, Or., Jan. 18th, '99.

Few realize how far reaching and helpful is a single hint or suggestion supplied through type by one who works with his eyes open and thinks and observes while he works and sees others work. Everyone who supplies useful information is in turn benefited by the experiences related by others, and in the interchange all are advanced in the knowledge of their business.

Mining Summary.

ARIZONA.

The South Bisbee Co. has secured the O'Hare group of claims comprising five properties near Bisbee. Considerable work has been done on them and they show good indications.

In the Ajo mining district, in Yuma county, C. C. Bean is operating the old Ajo properties, and A. J. Shotwell of Denver has begun work on the new Ajo mines. There is a small mineral zone in the Ajo mountains at that point, where high-grade ore is found. The old Ajo mines were worked in the early days, and the ores shipped to Swansea, after being packed to the coast over the desert. Ore was shipped which ran as high as 60% in copper and $90 in gold values. The work was principally of a surface character, and the present development of the mines is to gain depth.

The Old Dominion smelters, near Globe, started up recently after their shut-down since the middle of December by reason of the heavy snow storm and the inability of the mine to secure fuel. The management has contracted for 2000 tons of coal at $15 per ton, delivery of which will extend over six months. With the operation of both smelters, it is estimated the Old Dominion should be able to produce 1,500,000 pounds of copper per month. Their cost per pound should not exceed 8c. The company about a month ago shipped 500,000 pounds of copper and has on hand at least 1,500,000 pounds. The switch connecting the Gila Valley, Globe & Northern railway with the smelters, about one-quarter of a mile in length, is completed. Coke will cost the company about $15 a ton, as compared with $25 formerly.

A rich strike is reported from the Prince George, at Stockton Hill, and in the Horn Silver mine, near White Hills.——W. H. Albritten, near Globe, encountered a deposit of copper ore that carries copper up to 35% and gold value $35 ——The Blue Jay mine, near Tucson, at the 359-foot level is producing gold and silver that yields $50.

The winzes and lower levels of the American Flag mine, in Wallapai mountain, will be immediately cleaned out and sinking resumed.

A Philadelphia company is investigating the Moor mine, at Pearce, with a probability of bonding it.——The machinery for the Jerome M. Co. is being placed in position and Supt. Dillon will push development work.——The Jerome *News* is informed that the Equator lawsuit will be settled and development work will begin at once.——D. E. Saunders will soon begin operations on the Reward copper mine, near Casa Grande. The Reward ore is said to carry good values in gold. There is a smelter on the mine, but it is not supposed to have been very profitable in the output. The new management contemplates 800 feet of work. The main shaft is down 180 feet, with a drift 300 feet, and at this point a winze is sunk 250 feet.

The *Mohave County Miner* reports Los Angeles men, under the name of Watson & Co., are working the Lady Bug mine at Mineral Park. They have put in 400 feet of track in the tunnel and have 180 feet of stoping ground opened up. The ore streak is a good width and shows ruby and native silver all through the rock.——A cyanide plant will be put in at the Mocking Bird mine, Weaver district, capable of working about ten tons daily. The Mocking Bird contains a larger amount of ore than can be cyanided, as well as several hundred tons of tailings.——The Duquesne mine is making arrangements to put a large force at work. A big lot of new machinery is being placed, and as soon as possible work will begin on a large scale.——Nelson & Rice bought four bars of bullion from Crown King last week, valued at $10,000.——A new strike is reported on the 200-foot level of the Lone Star mine, Mineral Park.

Yuma *Sun*: T. D. MacLeod, on his Seventy-Six mine near Yuma is continuing development with good results. He has a 140-foot shaft, two 50-foot shafts and two 30-foot shafts, all in ore, but the extent of ore bodies have not been determined.——A large part of the force has been laid off at the King of Arizona mine for lack of water.——The claim recently purchased by J. Singleton, of Randsburg, Cal., is being developed.

CALIFORNIA.

Amador.

Jackson *Dispatch*: Harding & Southard will soon resume work on the Wallace Harding placer claim at Pine Grove.——Whitehead Bros. are working their gravel claim at Aqueduct City with good results. Owing to the scarcity of water they were able to work but twenty-one days the past year, but indications point to a long run during 1899.——The China Hill mine near Pine Grove has been started up by Stirneman & Co. It is a gravel property.

Jackson *Ledger*: The Amelia mine has encountered the ledge at the 800-foot level.——The engine at the east shaft of the Kennedy was operated Monday for the first time. Sinking will be pushed.——The reopening and enlarging of the Lincoln shaft at Sutter Creek has progressed to the 800-foot level, and a contract is to be let immediately to sink the shaft 400 feet deeper.——The Porteous Bros.' claim is yielding fair returns.

Butte.

Oroville *Mercury*: At Yankee Hill Clark Bros. have their ditch finished and will soon begin operations.——Malone & Wing are taking out fair grade ore.——M. Edon has cut into pay gravel.

Oroville *Register*: Mining at Cherokee, which has been suspended for several weeks, while the flumes were undergoing repairs, has resumed. The Costa Co. are running seven powder drifts in their mine and the Enos Co. is also running powder drifts in their claim.

Calaveras.

San Andreas *Citizen*: The Cuneo mine of Esmeralda started work last week and is running day and night. The mill is run by water power. Eight men are employed, and the prospects are good. The success of the Cuneo mine has been an incentive to activity in prospecting about Esmeralda.——Near West Point work on the Blizzard mine will begin soon.——On the Yellow Aster work is being pushed.——The Paragon mill has begun operations. Supt. Haley has opened a large body of ore on the Paragon mines.——J. Bardsley is taking out ore that averages 1 foot in width and yields $80 per ton.——The Lloyd Bros.' mine gives fair returns by working the ore in an arrastra ——The Paice Bros. are working the Oakland mine.——Supt. Stephenson is successfully operating the Wickham mine.

Mokelumne Hill *Chronicle*: Near Copperopolis, the Empire mine has finished the upraise. As soon as the weather will permit machinery will be placed. A hoist and compressor and more stamps are to be added.——The Lightner mine, owned by D. S. Lightner, has three shafts, 60, 80 and 100 feet in depth, and twelve men are employed. It is the intention to erect a 10-stamp mill in the spring. There will also be a new hoist and a cyanide plant. The ore is rebellious and is at present being shipped to Selby's. The ledge is from 8 to 16 feet wide and the ore is high grade.——M. Clark is operating near the Salt Spring Valley reservoir and has ten men employed. The shaft has reached a depth of 100 feet.——At the Pine Log and Royal mine the additional stamps will be ready to start in about fifty days.

El Dorado.

In the Ohio mine near Greenwood operations ceased last week.

Placerville *Democrat*: At the Gopher-Boulder mine, Kelsey district, the mill is running steadily. The force has been increased.——It is locally reported that C. D. Lane of Angels Camp is negotiating for the Shaw mine, near Diamond Springs.——At the German mine, near El Dorado, they are operating with a full force.——Ore is being taken out at the Starlight mine, and the mill will soon be started up.——It is locally reported that a new ore chute, fully as rich as the one that is now paying $1000 a day, was struck last week in the Union mine, near El Dorado. The Union's cleanup last month amounted to $28,000, the mill running day shift only.

Fresno.

H. B. Vercoe, who is interested in the Gavilan mines and other properties in Riverside county, is said to be arranging for the construction of a 100-ton smelter on the Copper King copper mines in Fresno county. The ore runs an average of 11 per cent in copper with $11 in gold and $3 to $5 in silver per ton. It is estimated that there are at the present time about 30,000 tons on the dump. Work on the property is being done on the third level.

Kern.

Los Angeles *Review*: Last week A. W. Collins, who some weeks ago bought the O. K. properties for himself and New York associates, also bought the Black Hawk mine, near Randsburg, for $12,000. Much high-grade ore has been taken from this mine and milled, but a vast quantity running from $9 to $12 has been left on the walls. When the Willard & Harrison mill, which is being removed from Cuddeback lake to the Black Hawk ground, is in operation—probably within four or five weeks—this ore will be stoped out and milled.——In the Stringer country much work is going on. On the G. B. lessees are taking out a good grade of ore.——On the Gold Coin, Nixon, Keller & Mann are taking out, at a depth of 150 feet, ore from a 2-foot ledge which will run from $100 to $200 per ton. A recent milling on a few tons of this ore notted them nearly $2000.——On the Orphan Boy, Kuffel & Nixon are sinking on the ledge; it shows good values.——On the Napoleon lessees are taking out ore, some of which is high grade.——At the Sunshine, T. W. & D. M. Atkinson are taking out some high-grade ore. They are down 125 feet. The ledge is small, averaging not less than 6 inches; but from 30 feet down, when well sorted, has run up into the hundreds per ton.——The Buckboard mine, owned by Mathison, Donovan & Adams, has two shafts sunk, the deepest being 125 feet. At this depth the ledge has been crosscut for 20 feet, but no footwall has been found and the ore runs from $5 to $48.——The Butte made a cleanup last week at the Johannesburg mill, netting a gold brick worth several thousand dollars. Since work was resumed on this property $75,000 has been taken out.——A gold nugget worth $445 was found by Martin & Clifford, working some placer diggings in the Garlock district, near Koehn's mill.——The average value of all the Wedge ore milled during '98 was $75.51 per ton. This was the average mill cleanup value of the ore, and does not take into consideration the tailings, which were afterward cyanided.

Randsburg *Miner*: The Ruby mine, near Randsburg, owned by Vanbrieson & Co., which has been under bond to Koehn & Wilson, has had the bond extended to February 10th. From this property 600 tons of ore has recently been shipped to Barstow and milled.——At the mines in Tuber canyon, in the Panamint country, the Montgomerys have milled the dump, all that came out of two deep shafts, one of them nearly 400 feet in depth, and it all averaged $26 a ton. They are now milling the croppings and it all pays.

Los Angeles.

The late rains have enabled resumption of mining in the San Gabriel canyon. The finding of several good-sized nuggets have been reported, some running from $30 to over $60. Some of these were found considerable above bedrock.

Mariposa.

The Doss mine has been unwatered for inspection and awaits the decision of an expert.

Mono.

M. P. Snow will soon start work on his mine near Topaz.——Work on the Cortez mine at Antelope is going along slowly on account of the snow.——The Sawmill miners will start work early in the spring.

Napa.

During December the following number of flasks of quicksilver were shipped from the various mines: Napa, 599; Ætna, 271; Great Western, 50; Vallejo, 40; H W. Herrick, 1; total, 961. This is a decrease of 133 flasks from the previous month's shipment.

Nevada.

At the Eagle Bird mine at Maybert the 20-stamp mill is running steadily on high-grade ore. The same company has charge of the St. Patrick mine at Washington and have begun work there. The new 5-stamp mill will be erected when spring opens.

Nevada City *Transcript*: A plant is being put on the Champion mine to work the tailings from the company's seventy stamp mills.

Grass Valley *Union*: M. D. Cooley made a strike of ore in his Ocean Star mine near Washington in a ledge 3 feet thick that will average $14 per ton.——A good ledge has been struck in Willow Valley by Coughlan, Hecker & Co. They are pushing the tunnel.——When the ditch which supplies the Reddik mine with water will be reopened from the snow blockade the miners will be put back to work.——At the Live Oak mine near Columbia Hill the new 10-stamp mill will be soon completed, and it is thought that by March 1st the stamps will be dropping on ore.

Placer.

Colfax *Sentinel*: The new power plant of the Pioneer G. M. Co. is running satisfactorily. There is plenty of water to generate power for all the motors. All the machinery is running by electricity and giving satisfaction. The motors are also driving the air compressors.——At the Bellevue quartz mine, near Ophir, some high-grade quartz is taken from the 150-foot level. The ledge is 2 feet wide at the point where the rich ore is taken out.——At the Eureka Consolidated drift mine, near Forest Hill, Supt. Chappellet has cut the channel but has not yet reached gravel. In the first raise the company cut the east rim and the new raise is on the west rim. Supt. Chappellet will follow the bedrock to get the pitch, when he will go down the raise and drift into the channel. The cement carries wash boulders.

Plumas.

(Special Correspondence).—It has snowed here almost continuously since Jan. 1st; altitude, 4750 feet; lat. 39 deg. 54 min.; Jan. precipitation, 13 inches; depth of snow fallen in that time, 81 inches; depth of snow now on the ground, 47 inches. The snow fell on dry, frozen ground, and at this altitude the water has not yet started in the ditches. Nearly all the mines are idle now, but the prospects are good.

Edmanton, Jan. 18th, '99.

Quincy *Bulletin*: On the White Lily quartz mine, near Quincy, owned by S. P. & R. H. Dunn, development work is in progress. Owing to the cold weather the mill has not been operating for the past six weeks. The lower tunnel cuts into a quartz vein 20 feet wide. A mill test of the ore produced an average of $4 per ton. They have another body of quartz 30 feet wide. The milling during the past season was from this ore body, and the average product was $12 a ton. The mill crushes eight tons per day.

Riverside.

A $1600 gold bar was the result of a cyanide run on some tailings of the Santa Rosa mine, near Riverside. Another one, a little smaller, was cleaned up from some Good Hope tailings in the same district. The Perris mines are shipping about $5000 a month in gold bullion.

Sacramento.

Near Folsom, on Mississippi Bar, work has begun on the big dredger. Engineer Griffin of the Risdon Iron Works is superintending the construction. The dredger will be rushed to completion. It will take three months before the machine will be ready for service. The boat will be built and launched before any of the machinery will be put in. It will be a flat-bottom and 75x100 feet in size. The contract for excavating the pit to launch the dredger has been let and work has commenced. The pit will be 100x200 feet in size and 6 feet deep. Dredging will be a new era in gold mining in this vicinity.

San Diego.

At Banner the Ready Relief M. & M. Co. started their mill last week on their own rock.——The Eureka mine has resumed.——L. & O. Bailey are working the Hidden Treasure mine.—Rock is being hauled to the Ready Relief mill from the San Felipe mine.

From the Bay Horse mine a large shipment of ore was made for a mill test. The results are said to have proved satisfactory.

Romona *Sentinel*: J. W. Thorman, one of purchasers of the Pacific Bank's interest of the Helvetia mine near Ramona, is looking over his newly purchased property. He will do considerable improvement work on the mine.

San Diego *Union*: The High Peak and Roosevelt mines, and a one-third interest in the Rossland mine, in the Julian district, have been sold to L. M. Smith by W. W. Roswell for $6000.

Shasta.

The steam quartz mill on the Spanish mine, near Shasta, is running steadily with abundant supply of water, fuel and ore. The success of the mill on the Spanish mine will give great impetus to mining enterprise in Shasta.——The Mountain Copper Co. are rapidly completing their new foundry. It will be capable of casting a 10-ton piece.——The Mt. Shasta M. Co. have awarded a contract for hauling ore from their mine on Clear creek to the Keswick smelter, at $3 per ton.

The Uncle Sam mine, near Kennet, which was recently sold to Deakin and others, has been incorporated under the name of the the Uncle Sam G. M. Co. M. Deakin is the manager of the property. The 10-stamp mill has been put in operation. Five more stamps are soon to be added. Work has also resumed in the mine.

Redding *Democrat*: The sale of the Golinsky group of copper mines near Kennet has been made public. The purchase was made by an Eastern corporation, through their agent, J. Park Channing. On or before January 4, 1900, the company contracts to pay B. Golinsky, F. Weischman and M. Clendenning $130,000 for the property, consisting of nine locations. In the meantime the bonders are permitted to patent the several claims and deduct, for that expense, $2000 from the purchase price. The purchasers will take immediate possession and are required to keep six men at work during the life of the bond. In addition to this group the company has contracted to purchase a quarter section adjoining for $30,000. The company is required to begin development work Feb. 4th.

Redding *Searchlight*: The first ore shipment from the Bully Hill group since December arrived at Redding this week. There will be some heavy shipments from there as soon as hauling can be made profitable. —— Near Shasta, Huntington & McPhail are developing a property with success.——On the Herron & Leach mine much development work has been done, and discloses a good chute of free-milling ore. The product is being handled by an arrastra with good results.——Another well developed property in the same district is the Pugh & Menzel mine, on which a mill is in operation.——Small & Dawe are developing a property under bond. The Oro Fino is also being worked under bond by Frick & Chase.——Mier & Russell are doing development work on a property from which a shipment of ore to the smelters produced satisfactory results.

Sierra.

Downieville *Messenger*: Ten more stamps will be started soon at the Mountain mine at Sierra City.——The Butte mine's force has got the water in preparatory to starting the mill again.

Siskiyou.

The Minetta B mine near Yreka is producing good results. It is a well equipped hydraulic property. The company has two ditches, one with a pressure of 230 feet, the other 335 feet, the 2-foot pipe line across the Klamath on a suspension bridge supplying three No. 5 giants for nine months in the year. The only difficulty is flat bedrock.

Fry, Macaulay & Oberholtzer have four quartz claims on the extension of the Sheba mine at Patterson creek in which the ledge is from 7 to 10 feet wide. The amalgam from this mine in a crushing of seventy-five tons at the Chester mill in Quartz valley, yielded from $50 to $70 per ton.——J. Wise will soon begin work again on the Best Chance gravel mine near Yreka which was worked a few years ago, but was abandoned on account of too much water. New hoisting and pumping machinery is to be placed.——River mining on the Klamath has been closed for the season. The late storms raised the stream over 2 feet and washed out a Chinese company near Honolulu, all the other companies having pulled out their apparatus before hand. The miners are making preparations for resumption of work early next spring.

Yreka *Journal*: McCaw & Nowell Bros. of San Francisco, interested in the Sheba quartz mine on Patterson creek have started the new steam mill and ho'st. The ledge is about 22 feet wide and is said to yield from $50 to $70 per ton. Some rich pocket gold quartz, not put in the mill, paid as high as $10 a pound. The Sheba Co. secured this ledge from Fry & Macaulay, and in addition, purchased the claim adjoining, from a Portuguese company, making their holding comprise an area of 200 acres.

Yreka *Journal*: The placer miners on Greenhorn have all begun to mine, now that water is furnished. The hydraulic miners at Humbug have 3000 inches of water, the streams in Scott valley are full of water, as also the ditches from the Salmon range to Oro Fino and vicinity. On Cherry creek, Deadwood and McAdams creek the miners are working successfully.——The Golden Star Quartz M. Co.'s tunnel is 600 feet into the mountain.

Yreka *News*: Foster Bros. started their new arrastra last week at the Lucky mine near Yreka. They have been busy all summer at this claim, taking out ore and building the arrastra. Quantities of the rock previously taken out went from $25 to $40 per ton.——It is reported that the Chicago company that bonded extensive holdings near Hawkinsville last summer has bought the Foster ranch. They have been making extensive tests. This is a dredging property.——D. Ream is running a tunnel on the Tom McGuire mine on Greenhorn. It will crosscut the ledge 30 feet below the old works, from which some rich pockets were takea.——Work on the Katie May mine, owned by A. Wetzel, will start as soon as the snow gets off. This claim has produced ore running $112 per ton. The tunnel will be extended to crosscut the ledge at a depth of 170 feet below the old works. It is in 150 feet. The ledge varies from 6 to 8 inches in width.——Ward & Co., the Seattle company that bought the Cape mine last September, will start developing operations next month. The old tunnel, running on the ledge, will be extended. They will confine themselves to development work, only taking out such ore as it is necessary to remove.——All the small placer claims among the foothills are starting up and everything promises a good season.——Last week were transferred the Knownothing, Independent and Novelty mines at the forks of Salmon from W. P. Bennett to Bennett & Smith.——J. E. Jones has bought J. Brazzi's placer claim on Lime gulch and has begun to

work the property.——The Portuguese placer miners on the north fork of Greenhorn and on Cherry creek are all taking advantage of the water supply and getting in full time.——The Blue Gravel mine near Yreka is no longer compelled to rely upon pumping water from bedrock for sluicing purposes.

Trinity.

The Brown Bear Co., at Deadwood, are pushing the new tunnel at the rate of 10 and 12 feet a day. There are fifteen men at work in the tunnel—three shifts. They have but two power drills, and the men get $3 per foot for every foot they run over 300 feet per month, besides their wages.

The Weaverville *Journal* says that the break in the West Weaver pipe line of the La Grange hydraulic mine near Junction City has been repaired and work at the mine has resumed.——All the mines around Weaverville are at work with plenty of water, and miners feel assured of a fair season.

Tuolumne.

Sonora *Democrat*: At the Jumper mine at Stent forty stamps are dropping.——The Golden Gate has forty miners on the payroll and the force will be doubled within ten days. ——The Densmore mill started up last Monday. There is plenty of ore on hand.——The Lost Fox mine is placing a new steam hoist, and will soon start up with a full force.——J. Meighan, on the Bullion mine near Groveland, will renew development.——At the Kanaka mine, near Groveland, sinking will be continued 200 feet deeper than the old works. The vein holds its average width, with occasional rich spots. Recently a section of quartz not over 18 inches square yielded $1000.—— Jones & Co. are opening up the old Garner claim, in the Buchanan district. The tunnel is being cleaned out and retimbered, after which drifting will be resumed. The tunnel is driven on the vein, which averages 3 feet in width.——J. Screech is developing a ledge 15 feet wide.——The extension of the Garner is again being developed. It was abandoned years ago at water level. During its brief operation the discoverers cleaned up a fortune through an arrastra.——The Bonanza mill started up last week, and unwatering the shaft has also begun. The shaft is but 200 feet deep, but acts as a receptacle for water in over 1000 feet of workings.

Jamestown *Magnet*: The App mill at Quartz is running and work has resumed in all departments.——The stations at the ninth and tenth levels in the Dutch mine were completed last week. Ore bins of 100 tons capacity are being erected at both stations.—— At the Tuolumne Mother Lode D. Co.'s mines, Big Oak Flat, a day and night force is developing the several properties. The company is erecting a 10-stamp mill.——At the Mazeppa mine at Stent they are hoisting high-grade ore.——The Santa Ysabel is short of water, though a supply is expected shortly. The company expects to start up full capacity soon.

Sonora *Independent*: At the Columbia mine, near Kid gulch, owned by Harris & Batte, high-grade ore is being taken out; the vein is 8 feet in width.——The power drills at the Star mine were started up last week. Forty men are at work.——At the Columbia E. & T. Co.'s mine, near Columbia, boring continues. A depth of 130 feet has been attained. A bed of gravel 40 feet in thickness had been encountered, which shows prospects.——In the Shamrock mine the vein is 40 feet wide.—— L. Page has begun operations on the Magruder mine, which has been abandoned a long time. The tunnel being run will strike below the old workings.——At the Bown mine at Tuttletown a 20-stamp mill is being built.

COLORADO.

The Cripple Creek tunnel controversy has been won by the plaintiff, the Matoa G. M. Co. A jury in the U. S. Circuit Court last week awarded the company $29,880 70, for ore extracted by the Chicago, Cripple Creek G. M. Co. while driving the bore of the tunnel through the Gold Pass No. 1 and Jubilee claims. The Matoa Co. brought suit for $110,000, assessing the ore as being worth that much, and a perpetual injunction. The court's instructions embraced three points of more than usual interest in tunnel litigation. Judge Hallett held that ground having senior rights and afterward deeded to a claim having junior standing, was still the possessor of seniority, the deed being not a waiver of the priority of its original location as a senior claim. The second decision was to the effect that a tunnel owner can acquire no rights within the boundaries of a previous claim upon either blind or other lodes. Another ruling made in the case was that it is proper and necessary to file a rejoinder to a replication if new matter is set up in the replication. Counsel claimed that all new matter in the replication should be considered as denied. Attorneys for the defense moved a new trial and asked the court for fifteen days in which to make the motion. The points of law developed during the progress of the case were intricate. The tunnel was projected through the ground of the plaintiff and ore extracted therefrom on the standpoint that the vein from which the ore was taken was opened up by the tunnel, as it nowhere appeared that it was the discovery vein of the Jubilee claim; that Section 2323 of the Revised Statutes of the U. S. gives the owners of a tunnel run for the development of a vein, the right of possession of all veins or lodes within 3000 feet from the face of the tunnel on the line thereof, not previously known to exist and discovered in such tunnel, and that the ground in dispute was originally embraced in the Gold Pass claim, and afterward included in the Jubilee patent, but excluded from the Gold Pass patent, which was prior to the tunnel site. The defendant claimed this made the Jubilee a junior claim.

BOULDER COUNTY.

At Ward a strike in the B. & M. mine was made in the 500-foot level and ore is stripped along the vein for 65 feet. The width of the pay streak is from 16 to 24 inches.——The Newmarket leasers shipped two carloads of ore to the smelter last week.——The Ward Rose mine is producing high-grade ore and the leasers are doing well.——The Smelter Co. is unwatering the Miner's Dream mine.

CHAFFEE COUNTY.

A strike was made in the Turret district that assays $184 in gold.

At Salida in the Sedalia mine three new copper ore bodies have been discovered. It is being worked by L. C. Farree of Denver.

CLEAR CREEK COUNTY.

Idaho Springs *Gazette*: The West Santa Fe mine, near Idaho Springs, is sold to W. E. Renshaw for $50,000. It has a record as a gold producer.——The Lincoln mine has five sets of leasers who do fairly well.——The development on the Elliott and Barber consists of three adits on the vein. The first is in 400 feet, the second 450 feet, and the third 650 feet. Eight men are leasing on the different levels and doing well. The ore streaks are small but rich, running as high sometimes as eighteen ounces in gold per ton.——The Silver Mountain mine is producing large quantities of good ore and keeping the mill going full capacity.——The Hecla mine, near Georgetown, is producing good ore.——Holbrook & Tipple opened up a good streak of ore on the New Boston. They have been running on a 5-foot streak of concentrating ore that carries from 10 to 15% of lead.——The Aliunde mine shipped seven tons of ore last week from the new strike in the 850 level. The ore is of good grade, milling 408 ounces of silver per ton, and 12½% lead.——The vein of ore in the Maxwell & Hood portion of the Griffith mine is stripped for some distance to the height of 12 feet, of nearly solid galena, from 2 to 3 feet in thickness. A mill run of 24¼ tons of ore from this strike returned 47.75% lead, 34.75 ounces silver per ton, and 0.11 ounce gold. The ore netted $38 11 per ton.

DOLORES COUNTY.

At Rico the Enterprise M. Co. bought one claim and a half interest in another, near its own group, for $6000 cash last week.

EAGLE COUNTY.

Red Cliff *Blade*: The St. Joe mine, near Red Cliff, is shipping from a 5-foot body of good grade ore.——The Garbut mine has been leased to a Leadville company who will soon start operations on a large scale. It is understood that machinery will be placed on the property at once and work pushed.—— The Black Iron is producing high grade carbonate ore.——The shipments of ore from the Battle Mountain district were twenty-four loads since January 1.

EL PASO COUNTY.

At Cripple Creek eighty men are employed in the Los Angeles. Several sets of subleases are shipping ore from the various levels of the mine. The ore shipped during the last ten days was eight cars, running from two to three and a half ounces a ton.

The Gold Coin Co at Victor reports show the past year's production to be 31,833 tons with a gross value of $1,051,149.20; freight and treatment charges, $313,000; dividends, $130,000; cash on hand, $336,000.——The Cresson Leasing Co., on the Jack Pot, has sunk its new shaft into ore 309 feet. The management has increased the force to 140 men, and in another week machine drills will take the place of the hand apparatus. These changes will insure an increase of 50 per cent in the production of the lease.——Recent returns on twenty-seven tons of ore from the Cal Wagner lease, on the Minnie Bell, yielded $69.40 a ton.——The lessees on the Whisper shaft of the Gold Sovereign are shipping ten tons of 2-ounce ore daily. Eighteen inches of pay ore has been opened at the 175 foot level, and a high grade streak has been cut by the drift at 125 feet.——At the annual meeting of the Specimen it was given out that the royalties from the different leases on the property are averaging between $1000 and $1500 per month. The Canyon City & Cripple Creek Leasing Co. has opened a pay streak 24 inches wide that returns $800 a ton. In December these lessees took out $6000 worth of ore.—— Machinery is to be erected at once on the Dexter on Bull Hill by Edwards and associates, the lessees. At 70 feet a good body of ore has been opened.——A shipment of thirty-eight tons of high grade mineral was made from the Saunders lease on the Silver Tip last week. About twelve tons of this amount was screenings, yielding $500 a ton, and the remainder ore of $75 grade.——The electric power company last week started the electric pump in the 540-foot level of the Moon-Anchor on Gold Hill. The pump has a capacity of 500 gallons a minute, and works with smoothness. Another pump of similar capacity will soon be installed. Electric hoists were installed last week at the Fayette and Pharmacist mines. ——The Moon-Anchor at Cripple Creek is reported sold to an English company. The old company receives 50,000 shares of £1 each in the new company (one-seventh of its capitalization), and a minimum of $900,000 in cash, which will be paid as the stock is sold in London. The old company also retains other valuable properties at Cripple Creek.

The Victor *Record* announces the sale of the Hemenway and Jenkins interests in the Longfellows Nos. 1 and 2 to W. S. Stratton for $125,000.——A $50,000 bond and an eighteen-months lease on block 18 of the Arequa townsite were granted yesterday by Bennett and Meyers to R. H. Simmons of Cripple Creek.

Victor *Record*: The Johnstone lease on the Republic mine at Victor has eighty men employed, all that can be working on ore. The production will be maintained at about twenty-five to thirty tons daily.——Returns were received last week from a shipment of nearly twenty tons of ore from the Favorite, which gave gold values of 2.47 ounces to the ton. There are 5 feet of ore exposed in the stope.——Less than three weeks ago Welch and Long started work on a lease in the 150-foot level of the Dante, and they have in that period marketed four shipments of ore, about forty-eight tons, and it has returned a general average of $55 a ton. The vein is 3 feet in width.——From Cripple Creek were shipped recently fifteen cars containing about 332 tons of ore, by special train, to a Denver smelter. It contained 5100 ounces of gold, whose bullion value was $102,000. It was bought, it is believed, from the Isabella company.——The lease on the Little Pearl, held by Ashby & Blickerstaff, was sold last week for $18,000 to an eastern company. The Little Pearl is a small fraction of Bull Hill, and has produced considerable pay ore of late.——An 18-inch vein of $60 ore has been opened in the War Eagle, on Bull Hill. The property is under lease to Johnson & Peterson, who struck a vein of phonolite, carrying average values of three ounces in gold, of which sixteen tons were shipped last week.

GILPIN COUNTY.

The Lotus mine near Central City shipped a 300-ton lot of milling ore to Idaho Springs for treatment. The mine is also shipping a good grade of smelting ore.——In December the Carr mine on Bob Tail Hill produced ore to the amount of $3057 from six tons of first-class at $269.50, $1617; four tons of first-class at $105, $420; 120 tons of concentrating ore, $1020.

Central City *Observer*: Last week Cundy & Co. of the East Nottaway mine, near Central City, sold to the State Ore Sampling Works, in Black Hawk, a lot of ore which gave the following values: Gold, 37.40 ounces; silver 13.50 ounces, and 7.20% copper per ton —a total value of $742 per ton.

GUNNISON COUNTY.

Gunnison *News*: The Union and Constitution lodes, near Gunnison, have been bonded to Webb & Knox, who represent Aspen capital. The leasers will resume sinking in the shaft which now shows $11 ore.

HINSDALE COUNTY.

At Lake City the Superior group resumed work this week by unwatering the property. A large output of ore is expected to be ready for shipment in the early spring. Pennsylvania people have the lease.

LAKE COUNTY.

The Leadville Pumping Association have forty-five men on the payroll and are pumping 3300 gallons of water per minute from the five association shafts. Two new station pumps were installed last week at the 400-foot point in the Penrose shaft. At the Weldon mine when the pumping commenced there was 355 feet of water in the shaft, being within 210 feet of the collar. The Weldon is the richest and best mine in the city group, having given a profit of $65,000 in six weeks when it was worked under the $3 schedule. The Northern pumps are throwing between 500 and 600 gallons per minute.——The success of the leasing system is exemplified in the success various lessees are making with the Maid of Erin silver mines at Leadville. Between '87 and '93 these mines were the most extensive and best paying in the district. Very little work was done for two years previous to last year. Mr. Moffat last year decided to turn the property over to the small operator. There are ninety men working blocks of ground through eight shafts on the property. The output will be 4000 tons per month of various kinds of ore.——The Augusta lease on the Niles and Augusta claims is producing fifty tons daily of high-grade iron besides twenty tons per month of rich chloride ore which runs high in silver.——The No. 2 deep shaft of the Mikado M. Co., which previous to October 20, kept up an output of 120 tons daily of clean iron sulphides, but which has been closed down for a short time has resumed operations.

The Resurrection G. M. Co. at Leadville is shipping from 150 to 175 tons per day, while about 150 men are employed. The principal owners of this company are Denver people, including D. H. Moffat and Eben Smith, and C. T. Carnahan of Leadville. They have a large territory.

Leadville *Miner*: The northern shaft of the Clipper claim at Leadville is 165 feet deep. The main working level is located at the 550-foot point. The sinkers have beaten the water to a point 450 feet in this shaft and the pumps are throwing close to 700 gallons per minute.——The decision rendered last week in favor of Mrs. C. H. Brown, at Leadville, affecting the ownership of the Gordon gold mines, near Twin Lakes, will cause the immediate resumption of work on these noted gold mines, which have been closed down for four years owing to litigation. The group consists of the Gordon, Old Pounder and Bengal Tiger claims, embracing 19¼ acres of patented ground. One hundred thousand dollars has already been expended in developing the property and making improvements. There is about 5000 feet of development work on the claims. There are 35,000 tons of ore blocked out that runs from $10 to $25 per ton.

LA PLATA COUNTY.

A 4-foot body of good ore was uncovered on the 200 level in the Columbus mine, La Plata district, last week.

MINERAL COUNTY.

Creede *Candle*: Last week the ore shipments from Creede were 102 cars, or 1980 tons. ——The Nelson tunnel has been driven 6000 feet, and if it continues its present course the vein will be crossed a second time. The breast of the tunnel is dry, owing to the solid formation of the ground, and the water is fast sinking in all the big mines on the vein. In the Last Chance it is sinking at the rate of 3 to 4 inches a day.

PARK COUNTY.

Near Alma the Hill Top mine is shipping at the rate of twenty-two cars of ore per week from the Fulton lode to the smelter.

SAN JUAN COUNTY.

The tunnel being driven on the Summit vein to cut the Veta Madre at Galena mountain is in 1180 feet at a depth of 475 feet.

SAN MIGUEL COUNTY.

At Ophir the owners of the Gertrude property, Brink & Merrill, contemplate putting in a plant of large capacity for the treatment of low-grade ore.—— The Meldrum tunnel near Telluride, which is piercing the mountain between Ouray and San Miguel counties, crossing the Sheridan, Japan, Revenue, Columbia, Menona, Tomboy and a score of other well-known veins, will have an aggregate length of 22,315 feet, and it will pass under the comb of the mountain at a vertical depth of 3426 feet. One of its terminals is near Pandora, on the Telluride side, and the other is at Ironton. Eventually both terminals will be connected with the narrow gauge railway system now in operation near the two points. Its dimensions are 12x12 feet. At the Telluride end a power plant has been installed and air drills are penetrating the mountain at the rate of 38 to 40 feet a week. They have passed through a tough conglomerate and are now in the solid trachyte, where they make headway. The breast of the tunnel is in 1650 feet, 500 feet vertically beneath the surface, and several encouraging ore measures have been crossed. On the Ironton end the work is being pushed by hand and they are in 500 feet. When the solid formation is reached power drills will be put in and the work pushed. Mr. Meldrum expects to bore into the mountain from its two levels at the rate of 300 per month. In the meantime he will probably be shipping ore, drifting on veins and building a mill near each terminal. Capitalists of Glasgow, Scotland, are giving the enterprise financial support.

IDAHO.

At Wallace the drift on the vein in the Black Bear is 580 feet long, with ore all the way. The quality of the ore varies. That in the east face of the drift assays 60% lead and seventy ounces silver, while that from the face at the west end yields 65% lead and thirty-two ounces in silver. No arrangements have yet been made for milling the ore at home, and it is uncertain what will be done with it except that the property will be worked.——The Standard mill is running both shifts, ore from both the Standard and Hecla being milled there.

J. Warton, who has charge of the South Peacock mine in the Seven Devils for a Boston company, has bonded the Great Vale copper claim near Cuprum for $10,000.——The Checkmate mine, in Boise, the past two years has been productive of many shipments of high-grade ore, and will make another soon. The company has been prospecting new ground and has found a vein 5 feet wide In this a streak appears that is said to yield an average of $100 in gold per ton.——Lucky Boy ores at Custer City are saving about 67% of the values. Tailings have accumulated to the amount of about 10,000 tons, and the company will put in a cyanide plant to work them.—— At DeLamar next summer there will be three plants working on tailings. ——The company that bought the Crœsus group of mines and mill near Hailey recently has begun work. They are putting in an air compressor to operate power drills. The price of the property is $100,000, of which $5000 was paid last week.

F. Ibach received his first payment of $2500 on his half interest in the Ulysses group, near Salmon City, the other half interest having also been secured by the company, who are New Yorkers, and have already ordered a mill and expect to have the machinery on the ground within sixty days. The full purchase price of the property is understood to be $40,000. The property comprises a large group of claims, a 5 foot vein of very free-milling ore, worth $10 per ton, and several thousand tons of ore ready to stope.

J. E. Branscombe has sold to a Wisconsin company, represented by W. E. Smith, a quarter interest in the Cumberland mine at Silver City for $50,000 cash. The Cumberland was bonded in September, '97, by Sonneman & Branscombe for two years for $20,000. The property has been under steady development since then.

The Silver City *Avalanche* says that Sonnemann & Clinedinst have started work at the Cumberland mine, and that it is locally reported that a quarter interest in the mine was recently sold for $50,000.——T. Kennelly in the Red Cloud mine is working on a lease and is 200 feet below the seventh level.

Wallace *Press*: At Burke it is reported that a strike was made last week in the 1500-foot level of the Tiger mine.——The new chute in the Frisco, which was discovered last summer, is still being drifted on and holds out well. The shaft is 430 feet below the 1600-foot level, and in April the 1800-foot level will be opened up.——The Mammoth's new air compressor is at work and three shifts are pushing the tunnel.

MICHIGAN.

Conditions change in the Michigan copper mines, as in the gold mines of this west half of America. If the Calumet & Hecla, Quincy and other large lake mines were compelled to produce copper by the methods in vogue in the '50s in Ontonagon county, they would have to stop dividends to-morrow. At that time hand drills were used in place of air drills and black powder in place of giant powder. One could only work six months of the year, for you could not get to the properties except by means of snowshoes. The freight cost was 1c per pound to the nearest point. One dollar will do more work now than $3 would then. The mining companies were then organized with but $20,000 to $30,000 capital; $250,000 to $300,000 in the treasury of a company now will go as far as $750,000 would then.

MONTANA.

Phillipsburg *Call*: Work at the Bimetallic and Granite mines has resumed and the mammoth engines are hoisting ore as when the output of silver bullion was fifty bars a week. Coal is used for fuel. The Bimetallic con-

centrator is running on ore from the Granite dump. Miners are at work in the levels which are being driven to connect the Granite and Bimetallic mines. The first tunnel, which is now nearly complete, starts from the 1000-foot level of the Bimetallic mine and will connect with the 1400-foot level of the Granite, 400 feet being the difference in elevation in the two mines. A second connection is being made with the lower levels of the Granite mine at a depth of about 1800 feet which, when finished, will completely drain the Granite. The water is to be pumped at the Bimetallic mine to the 1000-foot level, whence it will find its exit through the drain tunnel, which was completed several years ago. This arrangement will prove a great saving to the company and a good profit can be made even at the present low price of silver. As soon as the Granite mine can be drained of water, miners will be put to work, the bulkheads will be removed from the face of the drifts and mining resumed after a suspension of six years. The ore is to be hoisted through the Granite shaft, and a tramway is now being constructed from the Granite hoist to the ore bins at the Bimetallic mine. The car will take on a load of coal for the Granite hoist, and in that manner operations will be most economically carried on. Teams are engaged in hauling lumber, and the construction is progressing steadily under the favorable condition of the weather.

From Saltese the car of ore shipped recently from the Last Chance weighed 39,500 pounds and the returns received from the smelter gave a net value of $2933 58 above freight and treatment charges. The value was almost all in the silver, it yielding a little over 288 ounces per ton. There was a little gold and some copper. The property is being worked under lease.

NEVADA.

STOREY COUNTY.

Virginia *Chronicle*: The lower section or bottom part of the hydraulic water lifting plant, to be installed on the Sutro tunnel level of the Con. Cal. & Va. mine, has been coupled. At the point where the discharge pipe is coupled to the arched or horseshoe shaped gun-metal casting the diameter is decreased several inches, the first joint of the discharge pipe above the point where it is coupled in the arched casting being in the shape of an elongated funnel 10 feet in length, the hollow arched tube into which the pressure pipe discharges having an inside diameter of only about 6 inches at the arch while the diameter of the discharge pipe above the funnel shaped joint is 14 inches. On the opposite side of the arched or horseshoe shaped casting, a foot or more below where the discharge pipe will be coupled on, is a nozzle cast inside of one of the legs or arms of the arch. This nozzle, or the point where it discharges, is an inch or more below the opening where the suction hose that draws in the mine water is coupled to the arm of the arched casting. This nozzle has a diameter of only 1⅛ inch and the velocity of the water at the end of the nozzle is 360 feet a second.

The water descending through the pressure pipe with a volume of 100 inches and a fall of 2000 feet, compressed to a diameter of 1⅛ inches at the point of discharge from the nozzle below the opening to which the hose is coupled, creates a vacuum and the vacuum so formed creates a current having a velocity of 40 feet a second, flowing into the discharge pipe, where it is forced upward to the Sutro tunnel level by pressure from the small nozzle just below the point where the mine water enters the discharge pipe.

The part of the plant described above is always submerged, and after the water is drained to a certain depth other lengths of pipe are ready for coupling and the plant is lowered to a further depth, the coupling of extra lengths of pipe only requiring a short time. To convey some idea of the work involved in the installation of the plant it is relevant to mention that it is necessary to install a column 1500 feet long, resting upon a base 24 feet wide that must be strong enough to sustain seventy-five tons in a shaft open 1000 feet below the base of operations. In this same compartment will be installed two lines of pipe with 20-inch flanges, leaving room to move a small cage, leave working room for the removal of 1000 feet of pump rod, the projecting portions of the pump bobs and 2000 feet of 12-inch columns with flanges of 17½ inches—and all of this in a space of 5 feet 4 inches by 5 feet 10 inches. Also to provide means for duplicating the pumping system so that one of the elevators can operate in one of the hoisting compartments, while the regular pumping will finally be done through the pump compartment. On account of the limited space all the fitting is done on the surface. It is expected that the plant will be in operation within the next twenty days.

The copper mines sold for $20,000 in Santa Fe district, Esmeralda county, last week by J. Fagan and W. Callahan, were bought for an English company. It is locally reported that the company will begin the development of the newly acquired property on an extensive scale early in the spring and will install a smelting plant either at Soda Springs or Hawthorne.——The Robust mill, at White Pine, is completed as far as the crusher. The shaft on the mine is down 120 feet, and drifting on the ledge will begin soon.

White Pine *News*: J. P. McOmie resumed work last week on the Chainman mine near Ely and has begun to sink a winze on the ledge from the No. 1 to the No. 2 level, 157 feet. The stope which the Lane Co. allowed to cave has been opened up again for 60 feet, and shows a ledge 4 feet wide for the entire distance that averages $30 to the ton in gold. The same ledge has been tapped on the No. 2 level.

Austin *Reveille*: J. A. Blossom shipped several carloads of high grade ore to Salt Lake City from his Kennedy group of gold mines.——J. B. Fitzgerald will start in full capacity his cyanide plant on the tailings at Pittsburg.——J. Mellander of Galena is taking out a car of valuable ore, which he will ship to Salt Lake.——J. Johnston has leased from B. F. Wilson a mine in Galena canyon and put a force at work extracting ore.——The Glasgow & Western Exploration Co., which operates the Mammoth Adelaide copper mines, near Golconda, are also interested at Copper canyon, near Battle Mountain. The placing of a hoisting engine is completed and the number of miners increased.

NEW MEXICO.

The Supt. of the Bonanza Development Co. says that the Hearst estate will have a concentrating outfit under way before the end of the month, by which the lower grades of copper ore will be treated. Over $60,000 worth of high-grade ore has been gleaned from the Santa Rita Copper property since the Hearst estate commenced work a few months ago. All the ore marketed by the Hearst estate has averaged or mined over 20% copper.

A receiver has been appointed for the Legal Tender mine at Elizabethtown.——The Senate and Bobtail properties have developed ore of high grade. The mill is running steadily.——The Mills Co. have their shaft down 106 feet, and it is locally reported that a body of $50 ore is exposed.——High-grade ore has been encountered in the Blue Bandana shaft, 50 feet lower than the tunnel workings. A pumping plant is contemplated. The Blue Bandana claim is owned by the Montezuma G. M. & M. Co. and is managed by C. J. Dold of Kansas City.

El Cielo mine, near Hermosillo, is being worked with good results by Grant & Co. There is a 5-foot ledge which runs about $25 in gold per ton, $140 in silver, and a large percentage of lead. A shipment of ore made recently yielded $16 in gold, about $300 silver, and considerable lead. A tunnel has been run on the vein 250 feet in ore all the way.——In La Indiana mine drainage work is being continued. The vein is wide and runs pay ore, although the mine has been worked for over fifty years.——Many of the mining companies of Pachuca are availing themselves of electricity for motive power. The Dificultad and San Rafael mines are using pumps run by electricity.

In Sonora, near La Dura, the La Dura M. & M. Co., a close corporation with only three stockholders, employs over 1000 men. They operate their own concentrating plant, and also ship an average of 300 tons per month, which carry from 300 to 400 ounces of silver to the ton, beside small quantities of gold, lead and copper.

Near Carbo L. Lindsay is developing a group of copper properties. The ore bodies are large. He has one shaft 75 feet deep, and three other shats 60 feet each, and a tunnel 50 feet in length.

At the Mesa Quemada mine development work is being pushed. The ledges are large and low grade, but will be worked on an extensive scale.

Last week the Santa Rosalia M. Co. made the first shipment of bullion from the new mill started in December of gold bullion to the value of $7000. The high-grade rock is not run through the mill, but will be shipped, and only second grade rock run through the mill. Recent work has developed a large body of second grade ore in the old Spanish workings of the property which, with what was developed by the present owners in the new workings, demands more stamps in the mill, which Supt. E. L. Murray hopes to get the company to place immediately.

It is estimated that when the new Chihuahua & Pacific Railway is completed from Guerrero, this road alone will bring to Chihuahua from the Sierras 2000 tons of smelting ore daily. A large smelting plant for Chihuahua is contemplated.

OREGON.

Press dispatches state that Finch & Campbell bought the Cornucopia group in Union county for $600,000 from J. Searles of New York. There are forty claims in the group.

Near Baker City the English mine is employing fourteen men, doing development work, and the results are satisfactory.——The bromine-chlorine plant will be ready for operation March 1st.——The Carrie B. mine is taking out good grade ore.——The Virtue Con. M. Co. last week in Collateral property broke through the upraise to the surface. The ledge exposed is 2 feet wide for a distance of over 150 feet and of high grade. The management will at once put on an increased force and soon the Virtue 20-stamp mill will be in operation.

Grant's Pass *Journal*: The A B C M. Co., near Glendale, has ten men at work.——The Oro Fino mine, near Grant's Pass, is working four men.——B. J. Allison of Roseburg is developing a good ledge of gold-bearing ore near Glendale.——The Miller mine, in Farmers Flat district, has been leased to Kitchen & Muggins.——The Sterling hydraulic started up again last week with a good supply of water.

Jacksonville *Times*: The placer miners about Jacksonville are at work and making the most of the opportunity.——Miners are developing the Free Silver and Gold Standard mines in Sampson creek district near Ashland.——A. Watts is operating his placer claim on Horsehead on full time, with good results. He recently brought $500 in gold dust to Grant's Pass.——Next spring Washington parties will prospect the big Yank ledge in Galice creek district and deep shafts will be sunk.

SOUTH DAKOTA.

The American M. Co. at Ragged Top are rushing work on their new plant, and will have their machinery on the ground next week and be ready to resume operations soon.

The Homestake Co., Black Hills, is dropping 540 stamps, and this number will be increased when the present scarcity of water is overcome. This will be done during the coming summer. Surveyors have run new water lines from Cold Springs and Spearfish creek. The latter will probably be brought into the Homestake plant at an estimated cost of $1,000,000. This will necessitate about twenty-one miles of ditching. The company is operating 400 stamps of their own and is running the Highland mill of 140 stamps under lease. The Highland Co. in turn are operating the Deadwood and Terry mine and a 160-stamp mill.

UTAH.

Near Vernal on the Colorado line the past two years the Bromide mine has been worked on a small scale and over 4000 tons of 15% copper ore have been treated at the primitive smelter. Occasional shipments of copper bullion, 96% fine, have gone to market. The great distance from the railroad retards satisfactory operations.

At Park City sinking the Silver King shaft 200 feet deeper was begun last week, by three shifts of seven men each. It is estimated that with ordinary working ground the task will have been completed in about three months. The size of the excavation is 7½x15 feet.——Shipments of ore the past week were 1,702,610 pounds.——The Copper King mine, near Park, is developing a ledge that contains, aside from several feet of second-class ore, a streak 2 feet wide which is said to pay a net profit of $20.91 a ton. This streak carries over 30% copper, $3 in gold, and silver of between $2 to $3 to the ton.——Work at the Massachusetts has been suspended, pending the arrangements for sinking the new shaft.

At Bingham, the Miner's Dream mine, under bond and lease to the Dalton & Lark people, will soon cut its big vein at 1000 to 1200 feet depth. A crosscut that will be 360 feet in length and has been run 320 feet is approaching the Dream from Dalton & Lark ground. From upper workings the Dream has to date shipped 10,000 tons of good ore, carrying lead, silver and gold.——Shaughnessy & Berryman, leasing the Yosemite, are producing three to four tons per day. The ore carries a good average of lead and silver.——Mgr. Hill has air connections completed at the Fortune and will now increase production from the large ore body recently encountered.——The Red Wing will this spring be a weekly shipper of crude ore and concentrates.——The Showall placer shaft is going down steadily at the rate of 2 to 3 feet per day.——Eleven cars of ore left Bingham depot last week, mostly the product of Old Telegraph leasers, but including three carloads from the Julia Dean. Average shipments are five to six cars per day.——The Rand tunnel, through which the Grow Co.'s group on Golconda mountain is being opened up, recently found an ore body reported to be good.

At Sunshine the Reindeer mine is bought by the Gold Reserve people for $12,500. The company has started an incline on the vein.——At the Annie a new 40 H. P. boiler and hoist are being installed, and sinking the shaft will be continued. It is down 350 feet.——From Golden Gate mine at Mercur last week there passed through the sampling rooms of the Refining Co. 5000 pounds of gold dust, the value of which is estimated ranging from $30,000 to $100,000, representing the gross earnings of twelve days.——The shipments out of the camps of Tintic the past week were sixty-five cars of ore, seven cars of concentrates and forty-four bars of bullion.

The Mercur *Mercury* says an average of 150 tons of ore is being treated in the Sacramento mill. A larger plant will be put on the property in the spring. New bodies of ore are being opened up and but little stoping is done.——At the Little Pittsburg the tunnel is in 130 feet. Work is being crowded.——At the La Cigale mill 100 tons per day is being put through the crushers. The ore leaches good. The cost of roasting ore is between 30 and 40 cents, and while most of the ore leaches well without roasting, it is in much better condition for leaching after being baked.——The Old Jordan & Galena, at Fish Springs, made new strikes in the lower workings of lead, silver and gold ore and also a body of copper and gold. Recent samples from the copper body show an average of 9% copper and $5 in gold.

The Swansea mine at Silver City shipped a small trainload of ore.——Three cars of high-grade silver and gold ore were sent out from the Centennial-Eureka last week.——The Lower Mammoth of Tintic has resumed shipments and reported at the sampler last week with two carloads of high-grade ore.——The Eureka-Swansea Extension at Tintic struck a streak of quartz 28 inches in width yielding two ounces in gold, with twenty-three ounces silver per ton.

In the Lower Mammoth mine at Mammoth 5 feet of solid ore is exposed and continuous shipments are promised. This ore is on the 300-foot level and assays show 20% copper and 45 ounces silver, with 18% lead and $2.80 in gold.——The proceeds of two lots of ore from the Northern Light mine yielded 449 ounces silver, 18% lead and $10 80 in gold, and on the second class 204 ounces silver, 7% lead and $4 in gold; for the two a check for $7000.——The Centennial-Emma M. Co., whose properties at Alta have been practically idle for a long time, have decided to soon resume operations.

The Mercur mills at Manning have begun work. The property will turn into the plant 400 tons of ore daily. The 200 miners who have been experiencing a holiday while the new plant was being started up, have returned to work.

WASHINGTON.

At Colville, work is progressing on the Great Northern mine. They have a vein of gold-bearing ore developed at 180 feet depth, with a tunnel on the ledge, having a pay-streak 2 feet thick which runs $60 to the ton in gold and copper.——At Northport a strike was made last week in the Covote mine, owned by the Scottish American M. & D. Co The ore body is 6 feet across, containing copper with iron and galena. Assays average $70 to the ton.——At Chewelah, J. C. Hooker has begun work on the Juno claim, which is showing copper pyrites.——Tinsley Bros. are extending the tunnel on the Bromide Mountain claim.——At Republic, the Mephisto G. M. Co. have discovered quartz of good value.——Work upon the Eldorado claim began last week.

W. M. Ridpath recently bought a sixteenth interest in the Iron Mask claim in Republic camp on a basis of $40,000 for the property.

The Maud S. group has a crew working on the property. They have uncovered a ledge from 4 to 10 feet wide and are running a 250-foot tunnel. The ore assays from $3 to $6 per ton.——The Morning Glory tunnel has encountered the vein and there are 5 feet of quartz; average samples yield $60 per ton in gold.

In the Mary Ann mine the ore in streaks is high grade; average assays show that 18 inches of ore runs $20.

The Blue Bird claim is said to be producing ore that runs $33 a ton.——Assays of ore from the Palo Alto gave from $22 37 to $153 75.

The Deer Trail mine No. 2 near Davenport, is owned and operated principally by Davenport capital. The ore is freighted to Davenport by teams and from Davenport it goes to the smelter. It is a high-grade silver property and yields 370 ounces of silver and 12% of lead to the ton.

Everett *News*: At Index there are about 150 men at work on the different claims in that district doing development work. M. Haber, who represents a German syndicate, has thirty men at work, has spent in the neighborhood of $50,000, and will spend as much more this summer.

Spokane *Review*: The Flora claim, in Republic camp, will be developed by the Flora G. M. Co. The property has a vein 2 feet wide that is said to yield $32 in gold per ton.——The Nevada claim, in Republic, operated by a company, has opened, it is said, a 3-foot ledge, showing ore of good grade.——The Dora property, in Republic, last week struck 3 feet of quartz.

WYOMING.

At the First National Bank, Rock Springs, there is a 100-pound bar of copper bullion, said to assay 96%. This is a sample of a six-ton lot from the Bromide smelter, near Vernal, and which was shipped to the Chicago copper refinery at Blue island. The Bromide mine is 100 miles south of Rock Springs. The owners lately put in a 36-inch water jacket furnace, and this shipment was of the first product of the smelter. The bullion carries a little gold. The mine and furnace have limestone and iron near to supply good fluxing material.

The Alma mine, near Grand Encampment, is shipping gold and silver ore, carrying some lead.——The discovery of copper ore was made on the Morning Star claim, in a vein 3½ feet wide, which averages 20 per cent copper.

FOREIGN.

BRITISH COLUMBIA.

The Ruby Silver mine, near Sandon, was bonded last week to Merrin & Armstrong for $20,000. A 300-foot tunnel is to be driven on the property. The Ruby Silver is one of the oldest claims in the Slocan country and over $30,000 of high-grade ore has already been shipped from the mine.

At Victoria the bill to exclude aliens from the placer mines of the province received its third reading last week and was immediately assented to by the Lieut.-Governor, so that it is now in effect.——The Minnesota Silver Co., Slocan, has spent $40,000 on its Slocan properties the past year. It intends putting in $60,000 more, most of which will be expended for a tramway and concentrator.——McNichol & Rackliff of Slocan City and Spencer & Duffy of Sandon, owners of the Noonday, near Silverton, have bonded it for $35,000. The ledge is 20 feet in width.——The Northwest Mining Syndicate of London, operating the Bosun mine, near Nelson, states that the company is spending about $3000 per month and is taking out 120 tons of high-grade ore, yielding about $8000. The company bought the property last June for $25,000, and up to date has shipped 480 tons of ore, which netted about $68 per ton, or $32,640 in all.

Rossland *Miner*: Shipments from the Rossland mines were resumed last week and will be continued for awhile at the rate of 200 tons per day.——The Iron Mask, in view of its coming lawsuit with the Center Star, is doing dead work almost entirely for the purpose of proving the continuity of the vein in dispute.——After two months' overhauling the Le Roi mine Supt. Tregear has the retimbering completed and the property is believed to be perfectly safe throughout. The plans of W. A. Carlyle, who has laid out the work, call for the operation of the property on a liberal scale, and as many men will be employed as can be put to work. On the 700-foot level drifting is in progress along both the hanging and the foot wall. A crosscut is being driven about 100 feet west of the stope, and it shows the ore body to be 40 feet wide.——Since the B. A. Corporation started work on the Nickel Plate Supt. Haskins has done 3000 feet of work, mostly on the 200-foot level.——From the War Eagle the shipments for the past week, owing to the delays in the railway service, were merely 340 tons. The War Eagle Co. received a refund of $16,000 from the Trail smelter on account of having furnished the stipulated 175 tons of ore daily for the past six months. During that time the shipments amounted in round numbers to 32,000 tons, and the refund was on the basis of 50 cents per ton.——It is conservatively estimated that the mining machinery bought for Rossland camp during '98 cost as follows:

War Eagle	$80,000
Deer Park	10,000
No. 1	5,000
Great Western	5,000
Nickel Plate	12,000
Virginia	6,500

LOWER CALIFORNIA.

San Diego *Union*: The Piramide M. Co., in the Juarez district, has secured a permit from

the Mexican Government to develop placer mines in that section and work is expected to begin soon. The permit covers 570 acres of and, and negotiations are in progress to have the land patented. It is said that the dirt and gravel is rich and that only the lack of water has prevented the placers from being worked on an extensive scale. The Mexicans have been working the mines on a small scale, paying $2 a load for hauling the dirt several miles to a creek. The Piramide Co. has been working since last August in making improvements on the property. About $20,000 has been expended in putting in a hydraulic plant. Two 50 H. P. pumps have been put in which will bring water from a creek three miles away. One of the pumps will force the water through a 9-inch pipe over a hill for a mile, and from there the water will run for some distance by gravitation in a ditch, to be diverted into a pipe line again and given force by the other pump to do the required work.

Three lumps of gold, each weighing about fifty ounces, were brought to San Diego recently from the Sorocco district.

MEXICO.

The new tramway of the Grand Central M. Co. at Las Amarillas has been set in operation and works successfully.——Near Aldame there is said to have been discovered a vein of ore running high in gold and 50 per cent lead to the ton.——A vein bearing gold, silver, lead and copper is being operated in the Cerso Prieto mine near Mapimi.——At Minas Prietas the Colorada-Creston Co. is doing considerable work in the old Prietas mine, and extracting ore at the surface which was overlooked by those who worked the property a generation ago.

The Seven Stars property, which was recently sold to the Monclova M. Co., composed of H. C. Lowther of Pittsburg and associates, is undergoing extensive development work. The property is near Chuichupa, in the State of Chihuahua. The company will soon erect a smelter.

ONTARIO.

From Wabigoon 500 tons of ore were shipped from the Munro property to the reduction works. It is probable that ore from 419 will also be shipped, and proving satisfactory the installation of a mill plant will follow.

Industrial Notes.

—During '98 Mexico mines distributed dividends amounting to $5,224,010; in '97, $5,079,107.

—The power of Cedar river is to be harnessed to furnish electric light and power for Seattle, Wash.

—Present coast passenger rates to Skaguay and Dyea are $15 and $25 respectively; freight rates, $8, $9 and $10 per ton; live stock, per head: horses, $22.50; dogs, $5.

—President McKinley will send a commission to examine thoroughly into conditions in the Philippine Islands. He fears that the treaty cannot be ratified by the present Congress.

—A golden spike will be driven on the last section of the Gila Valley, Globe & Northern Railway, at Globe, A. T., February 1st, to signalize the completion of that road and its advent into that great copper camp.

—The canners of British Columbia are alarmed at the proposed action of the Ottawa Government respecting the canning industry. They say that if the proposed suggestion is carried into effect, their $3,000,000 industries will be driven bodily to the United States.

—In San Francisco on the 21st met a convention to discuss conservation of the waters of California, participated in by representatives of the mining, agricultural and manufacturing interests. Permanent organization was effected. J. M. Gleaves is president, E. H. Benjamin secretary. The executive committee will memorialize the Legislature.

—The committee on permanent organization of the Pacific Ocean Exposition has a plan of organization for the exposition proposed to be held in San Francisco in 1901. A director-general will be made manager, with assistants to be appointed by himself, not exceeding three. His salary will be $10,000 a year, the salaries of the assistants to be fixed by the executive committee. There will be twenty-six committees.

—Consul-General Goodman's report from China shows that labor-saving devices are not wanted there. He says: "The cheapest thing here is a man. There is more labor than can find employment. A coolie carrying dirt will receive from 7 to 10 cents in gold per day. He must work from sunrise to sunset, not very steadily nor intensely, but putting in a great many hours and accomplishing a large amount of work for the amount of wages paid. There are more coolies willing to work for this pittance than there is work for them to do."

—Development of electric power for industrial uses is phenomenal in California, notably illustrated in the case of the two big plants in the vicinity of Redlands. It is stated that it requires 34,560 pounds of coal to operate 1 H. P. for one year by means of steam. The Redlands plant produces 1000 H. P. in electricity, in addition to the one producing 2000 H. P. Further, the plant of the Southern California Power Co., producing 4000 H. P., makes 7000 H. P. in electricity by the two companies in Mill Creek and Santa Ana canyons—equivalent, that is, to the consumption of nearly 121,000 tons of coal per year in the making of power by steam. With coal, therefore, at $8 per ton, this means $967,680; dividing this by 300, as the number of working days, gives an average of 806, the equivalent of this number of tons of coal mined per day, and, as the water flow is continuous, these plants are, as it were, inexhaustible mines producing this enormous output. A telegram yesterday from Los Angeles says: "To-day witnessed the completion in every detail of the longest power transmission system in the world, that which supplies the city of Los Angeles with electricity from force developed at the head of the Santa Ana river, eighty miles away. A telegram was sent from this city to-day by Senator G. H. Baker of the Edison Electric Co. and Southern California Power Co. to C. A. Coffin, president of the General Electric Co. in New York, informing him of the completion of the work and its successful operation for forty-eight hours. The system has occupied several years in building and has caused the expenditure of large sums of money. The wires enter the city in underground conduits." Electricity is as cheap a force as the world holds, even if made in the most expensive way, out of the most expensive material, at the most expensive locations, and transmitted with little regard to economy. It can be made where the location costs almost nothing, where the material from which it is made costs not more than one-tenth of the material now used. The doctrine of "varying levels," the easily-collectible force of water running to and from the "varying levels," is not generally understood. There are 1000 instances of it to one of the expensive waterfall. Wherever water runs, wherever bodies of water lie so that they would run into each other if connected (a mere scratching of the soil will connect them so that they will dig their own canals by the running of the water), you can collect the force and transmit it by this process from the lowest valley to the highest mountain, down into the deepest mine, or off to the most inaccessible places. The force of water running to and from the "varying levels," a force which can never be exhausted because it is continually being renewed.

—The Nicaragua Canal bill passed the U. S. Senate this week by an almost unanimous vote. The following is a brief description of the work proposed: San Juan del Norte, on the Atlantic, and Brito, on the Pacific, are the termini of the canal. Its length from port to port is 169¼ miles, of which 26¼ will be excavated channel and 142⅔ miles is lakes, rivers and basins. The summit level is necessarily that of Lake Nicaragua, 110 feet above the sea. There will be three locks near either end. The summit level commences 12¾ miles from the Atlantic and extends to within 3⅓ miles of the Pacific. The summit reach, will, therefore, be 153¼ miles long. For 9¼ miles from the inner harbor at San Juan del Norte the canal extends southwesterly across the low lands of the coast to the foothills of the Cordillera, known as the Eastern Divide, where is located the first of the three eastern locks. Up to this point the formation through which the canal is to be cut is entirely alluvial and will be excavated by machinery. The locks follow in close succession, No. 1 at 9¼ miles, as above stated, with a lift of 31 feet; No. 2, 1¼ miles farther on, with a lift of 30 feet, and No. 3, about 2¼ miles farther on, with a lift of 45 feet. Here commences the summit level of the canal at an elevation of 106 feet above the sea, which allows 4 feet of fall from the lake for flowage. Beyond the locks a cutting is to be made through the eastern divide to the River San Juan, at a place called Ochoa, near to its junction with the San Carlos, where a large dam of the same elevation as lock No. 3 will be built, which, with such other embankments as are ascertained to be requisite, will impound the waters of the river and small tributary streams in their valleys, forming a series of large basins at the elevation determined by Ochoa dam and by the locks. The cutting through the divide will be about 3 miles long, with an average depth of 141 feet. The dam at Ochoa is to hold the waters of the river permanently at the height of 106 feet above the sea. Locks Nos. 4 and 5 terminate the summit level of the canal. These are close together, and will have a lift of 42½ feet each. Lock No. 6, about 1¼ miles beyond, is the last of the western series, and will lower the canal to the level of the Pacific, with a lift of 21 to 29 feet, varying according to tidal conditions. The Senate voted that the amount to be spent on the Nicaragua canal shall not be more than $20,000,000 in any one year.

Commercial Paragraphs.

THE Hercules Gas Engine Co., 305 Market street, San Francisco, has a contract with P. K. Wood of Los Angeles, Cal., to manufacture his pump.

AT Leadville, Colo., the Little Jonny mine is to have electrical appliances for light and power. The contract has been given to the Denver Engineering Works, and Eugene Y. Sayer, the electrical engineer, will superintend the work.

A. MIDDLEBROOK, the Denver manager of the Jeanesville Iron Works Co., reports the sale to the Ibex M. Co. at Leadville, Colo., of a large compound condensing mine pump 36-inch stroke. It will be the first 36-inch stroke mine pump at Leadville.

THE Risdon Iron & Locomotive Works of San Francisco this week received an order for two more dredges from Breckenridge, Summit Co., Colo., the two they put in there having done such satisfactory work that two more were deemed desirable.

J. C. WINANS, manufacturer of Winans Anti-Incrustation Powder for removing and preventing scale formation in boilers, has moved from his old quarters, 220 Fremont St., to the new modern brick structure No. 151 Fremont, where he will carry a full line of steam users' supplies.

In the United States Circuit Court at San Francisco, on the 23rd, Judge Morrow gave judgment in favor of the complainant in the case of the Risdon Iron & Locomotive Works against L. C. Trent for a permanent injunction and an accounting. The matter in dispute was the infringement by the defendant of a patent on a roller ore crusher. Judge Morrow decided that the Bradley crusher of the respondent and the Bryan crusher of the complainant were practically the same invention. A perpetual injunction was granted and an accounting ordered.

Our Southern California Representative.

Herewith is fairly presented the general appearance of our genial southern California representative, Mr. W. D. Curtis, of 223 W.

2nd St., Los Angeles, Cal., who is deservedly winning name and fame as an enterprising business man in the southern California metropolis.

Personal.

ROSS E. BROWNE expects to return from London about March 1st.

G. W. HALL, Supt. Eaglebird mine, Maybert, Cal., is in San Francisco.

P. KERVIN is slated for the superintendency of the Utah mine, Virginia, Nev.

MYER JACOBS has been appointed receiver at the Rawhide mine, Tuolumne Co., Cal.

C. ROTH succeeds C. W. Ayres as Supt. Turner's Flat Drift M. Co., Sonora, Cal.

D. SEARLES, Supt. Eureka and Excelsior mines, Sumpter, Or., is in San Francisco.

D. J. MCFAUL, Supt. Home mine, Nevada City, Cal., has returned from San Francisco.

W. J. ADAMS is examining copper properties and will be absent from San Francisco for some time.

W. J. SUTHERLAND, Pres. Holmes M. Co., Candelaria, Nevada, has gone to his gravel properties at Grizzly Flat, Cal.

F. W. PAGE, Mgr. North Fork mine, Forest, Cal., is examining properties in Siskiyou Co., Cal., for an Eastern company.

J. D. HEARD, Alameda, Cal., managing owner Greenhorn Blue Gravel property, Yreka, Cal., has returned from the mine.

C. A. HAMILTON of San Francisco, with A. Scowden of London, England, is examining copper properties in the Pitt river country of Shasta Co., Cal.

WM. M. STEWART was re-elected U. S. Senator from the State of Nevada on the 24th inst. The regular army always gets away with the militia.

E. H. GARTHWAITE of California has been appointed by Cecil Rhodes superintending engineer of the South African Chartered Co.'s mines at Bulawayo, Rhodesia, South Africa.

GEO. H. EVANS, late Mgr. Con. Gold Mines of California, at Oroville, Cal., purposes a visit to the U. S. of Colombia, S. A., to examine a mining property there for a Boston syndicate, as soon as the Comstock pumping operations have been successfully inaugurated.

H. HUESER of Cologne, Germany, who with Geo. Bayha was examining copper properties at Copper City, in Shasta Co., Cal., for Colonge and Dusseldorf bankers, returned home this week because of the death of his father. Either he or another expert will return to complete the work.

IRVING M. SCOTT'S name is mentioned in connection with the election of U. S. Senator from California, now under discussion by the Legislature at Sacramento. If Mr. Scott were to accept the position California would be ably, honorably and honestly represented by a representative business man, who would be in touch with the State's industrial interests. The Union Iron Works, of which he is general manager, in '98 carried a payroll amounting to $1,826,000. This sum was paid in wages to the workingmen in his employ last year.

DR. ALEXANDER GRAHAM BELL, the inventor of the Bell telephone, at a recent meeting of the Starr King Fraternity of Oakland, Cal., talking of the invention of the telephone, said: "The telephone grew from my experiments to teach the deaf how to understand and to talk so that they could be understood. My father invented a symbol by which deaf mutes could converse, and finally I invented an apparatus by which the vibrations of speech could be seen, and it turned out to be a telephone. It occurred to me to make a machine that would enable one to hear vibrations. I went to an artist in Boston and he advised me take the human ear as a model. I told him that I would if he would kindly furnish the ear, which he did by supplying me with the ear of a dead man. With this I experimented, and upon applying the apparatus I noticed that the dead man's ear wrote down the vibrations. I arrived at the conclusion that if I could make iron vibrate on a dead man's ear I could make an instrument more delicate which would cause these vibrations to be heard and understood. I thought if I placed a delicate piece of steel over an electric magnet I could get a vibration, and thus the telephone was completed. The telephone arose from my attempts to teach the deaf to speak. I was not an inventor. It arose not from my knowledge of electricity, but as a teacher of the deaf. Had I been an electrician I would not have attempted it."

T. H. BROWNELL of the Everett, Wash., smelter, is in Washington, D. C., contending against a Treasury Department decision relating to sampling of lead ores. The Treasury insists on the wet method of sampling, and the smelter company demands the dry. The wet method shows exactly how much lead is in the ore, but the dry method shows what proportion the smelting company gets, as in dry sampling about 3% of lead escapes as fumes, the same as in smelting. Owing to this contention money due the company in rebates has been held up. The Everett works has become a bonded smelter and Mr. Brownell seeks to have the greater portion of this money released. It seems probable the Treasury will do this, retaining only enough to cover the 3% in controversy.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JANUARY 17, 1899.

617,712.—REFINING ASPHALT—A. F. L. Bell, Carpenteria, Cal.
617,825.—GATE—W. Blair, Vallejo, Cal.
617,919.—VESSEL CLOSURE—A. Braverman, Fresno, Cal.
617,731.—CORSET, ETC.—Emma A. Ford, S. F.
617,929.—FINGER SHIELD—O. E. Fowble, Los Angeles, Cal.
617,857.—TANK—J. H. Franklin, S. F.
617,829.—GAS CONCENTRATOR—R. P. Greer, S. F.
617,808.—WAGON TONGUE—S. M. Harris, Cheney, Wash.
617,785.—COWL—L. H. Honigbaum, S. F.
617,899.—SUCTION DREDGING—F. W. Krogh, S. F.
617,9?9.—SASH LOCK—W. Madison, Los Gatos, Cal.
617,991.—MOVABLE FLUME—J. B. McDill, South Pasadena, Cal.
617,834.—RIVETING MACHINE—R. S. Moore. Oakland, Cal.
617,835.—RAZOR—F. Patak, S. F.
617 905.—TRACTION SLED—J. C. & N. B. Peterson, Seattle, Wash.
617.884.—BRUSH—J. M. Poe, Santa Monica, Cal.
617 910—WATER ELEVATOR—H. Room, Olema, Wash.
61?,783.—HONE—T. R. Smith, Los Angeles, Cal.
617,823.—FRUIT DRIER—Thomas & Thompson, Jefferson, Cal.
618,019.—METAL SIGN—G. H. Tietjen, S. F.
617,914.—WHEELED SCRAPER—A. Titus, National City, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RAZOR.—F. Patak, San Francisco, Cal. Assignor of one-half to J. Frowenfeld of same place. No. 617,835. Dated Jan. 17, 1899. This invention is especially designed to provide means for conveniently separating and locking an independent and removable blade into the permanent back of the razor to which it is fitted so that it can be removed and replaced. It consists essentially of a channeled back, having a permanent latching device at the outer end, a transversely fulcrumed latching lever at the inner end, in combination with a blade having corresponding engaging devices formed upon it, and by means of these connections the blade can be easily inserted or removed without the use of supplemental tools.

TANK.—J. H. Franklin, San Francisco, Cal. No. 617,857. Dated Jan. 17, 1899. This invention relates to improvements in tanks which are designed to contain liquids. In the use of large containing tanks which are built of staves hooped together, it is found very difficult to prevent their becoming leaky. This invention is designed to prevent this shrinkage and leakage, and it consists in the formation of grooves or channels in the meeting edges of the vertical staves with transverse passages connecting the grooves or channels, and a water supply by which water may be constantly kept in the channels and passages so that the staves will not shrink and separate when the tank is not full. The water supply tube has connections at the bottom and a means for discharging any sediment which may accumulate therein so that it will not be introduced into the passages of the tank and eventually clog them.

RIVETING MACHINE ATTACHMENT.—R. S. Moore, Oakland, Cal. No. 617,834. Dated Jan. 17, 1899. This invention relates to an attachment for riveting machines. The object is to overcome a difficulty which arises when metal plates are to be riveted together, in which holes are bored or punched through the overlapping edges, and the rivets having a head on one end are placed in these holes and the opposite end is headed or upset upon the opposite side of the sheets. This difficulty of making a perfect joint in this manner arises from the tendency of the plates to become slightly separated while the upsetting of the rivet is taking place, and the result will often be that a portion of the rivet and the open space between the plates will be upset before the head is formed upon the end of the rivet, and the open space will thus be maintained and a leak occur at that point. In this invention the post is cut away upon each side to form bearing surfaces, and an upsetting die is carried by the posts between the said supports. A disk or plate adapted to support the parts to be riveted is mounted on the said supports and has a central opening for the die, and a plunger is adapted to force the disk backwardly by the act of lifting until the rivet is upset by contact with the die. The springs which press against the rear of the disk serve to close the plates tightly together by the first impact of the riveting apparatus, and they are thus held while the rivet is headed upon the opposite side.

How to Build and Operate an Arrastra.

Written for the MINING AND SCIENTIFIC PRESS by WM. H. WASHBURN.

Although the arrastra is generally considered to be out of date, we occasionally meet with a claim-owning prospector who still prefers this ancient crushing machine for testing the ore taken out in development work. When this is the case, the claim is generally remotely situated and transportation expensive, limited means being usually one of the conditions.

Where water power is to be had reasonably cheap, the arrastra may still find a useful place in developing a prospect into a mine, preparatory to the erection of more efficient modern machinery. When it has been decided to build one, a site should be selected to which the water power may be cheaply brought and high enough to afford ample dump for tailings and be out of reach of floods as well. It will be found convenient to have the camp or cabin near by when making a run.

The accompanying drawings are made with a few slight variations from a typical arrastra in Union county, Oregon.

The site being leveled off, the mudsills *b*, *b*, Fig. 1, are laid, the two center ones being gained into the "stump" or center post *A*, the upper end of which is about 28 in. above the mudsills.

There is an iron band around its top and lagging around it to protect it from being worn by the drags. The segments of the rim *B* are pinned to the mudsills. The first 12 in. above the sills are 2 in. thicker on the inside than those above them, which are 6 in. thick. This allows the "bed" or stone pavement *D* to wear down without leaving a ridge around the outside, not reached by the drags *C*.

A gateway for discharge, shown at *G*, Fig. 2, is 6 in. wide, having 1-in. grooves in its sides for a vertically sliding gate. It extends down to about 4 in. below the level of the bed. The issue, or lowest point of discharge, is temporarily raised to about 1 in. above the level of the bed by 1-in. strips under the gate, which are removed as the bed wears down, thus allowing the issue to be always the same height above it.

A silver-plated copper plate should be placed outside the gate, as a safeguard against loss when discharging. The sills are well tamped and covered to a depth of about 3 inches with fine sand. The bed is laid down on the sand with blocks of any hard, granular rock, granite being generally preferred. They may be about 1 foot thick and have from 1 to 2 sq. ft. of upper surface. Larger than this will not leave crevices enough to afford a lodgment for the amalgam and gold. They need not be accurately fitted, as the crevices should average from 1 to 2 in. wide and be nearly filled with sand. The bed should have a slight grade of about 1 in. in 10 ft. toward the gate.

Sometimes a narrow row of softer rock is laid next the rim and stump to equalize the wear. The vertical shaft *E* is 16 in. in diameter, its length being determined by the diameter of the water wheel and level of the tail race. It is hooped on each end.

The drag arms *F*, *F* are 4 x 6 in., gained together in the center and secured by the wooden key *f*, Fig.

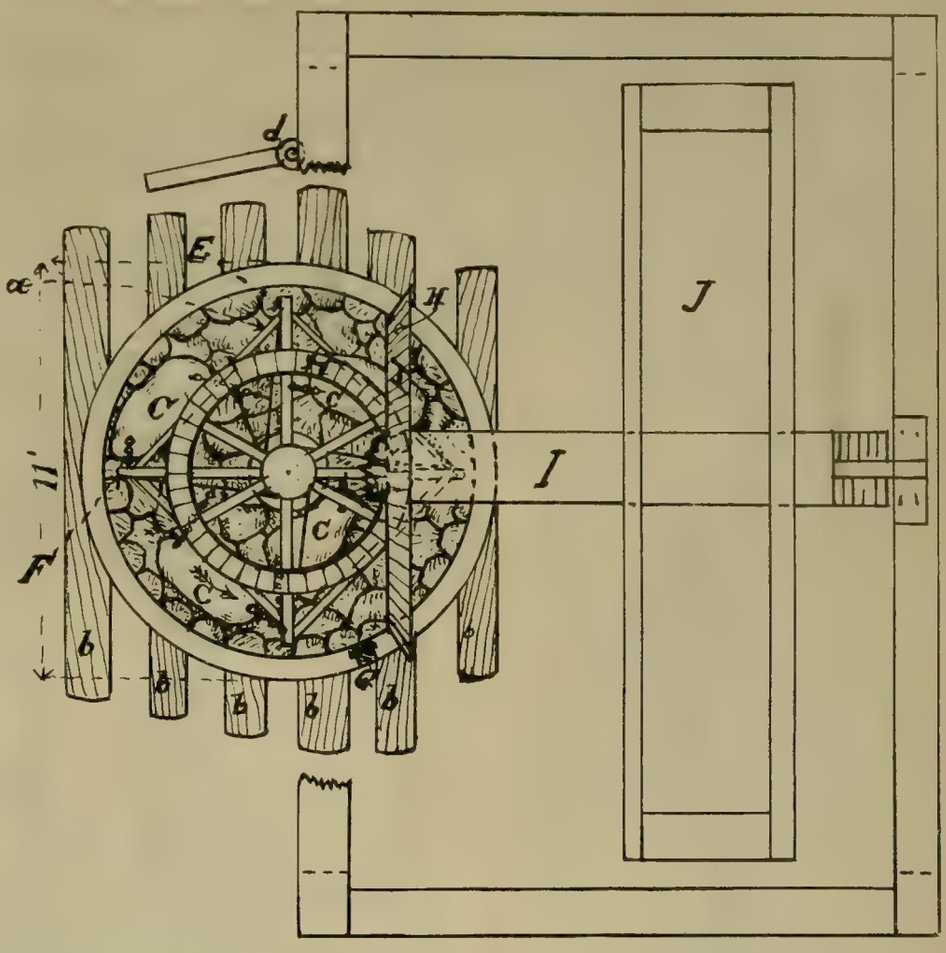


Fig. 2.

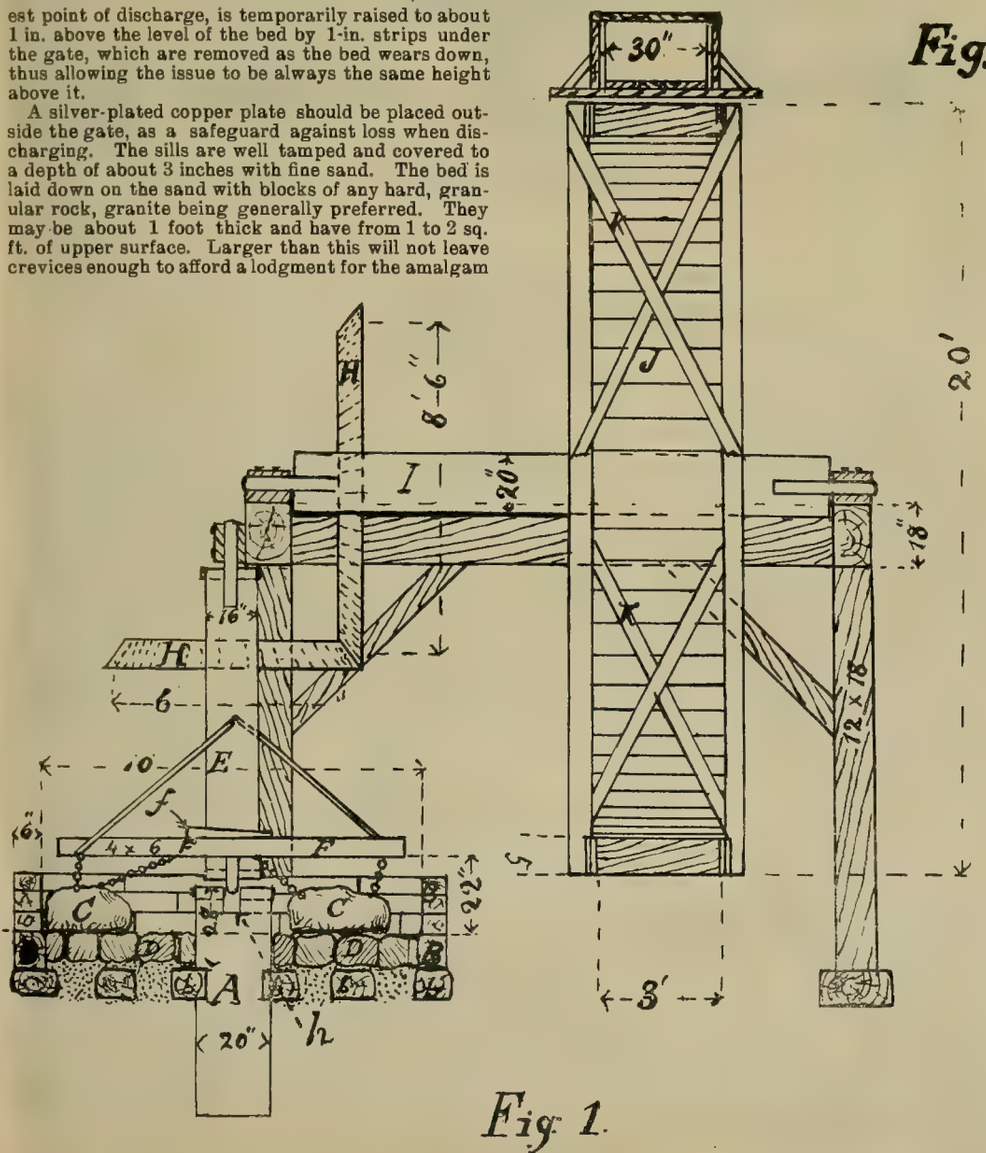

Fig. 1.

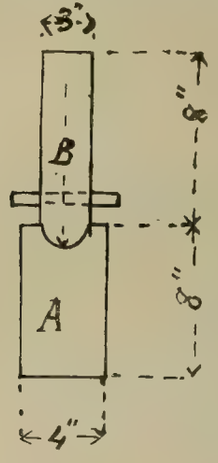

Fig. 3.

1. Besides the 4 x 4-in. braces *a*, *a*, Fig. 2, between the outer ends of the arms, rods of ⅝-in. iron run from thence upward to the leading side of the shaft.

The drags are usually hard granite boulders weighing about 1000 lbs. each. Smaller ones will do when power is scant, but their crushing capacity is determined by their weight.

A ⅞-inch hole nearly vertical is drilled in the upper side of each end of the drags, and about 5 in. deep, in which is inserted a ⅝-in. eyebolt enlarged toward the lower end. These are tightly wedged with dry wooden wedges. The use of lead or babbitt is not

recommended, as in case it should work loose the amalgam would be in danger of being fouled.

The drags are fastened to the drag arms by suitable chains, with due regard to thoroughly mixing the pulp when in motion. A small derrick at *d*, Fig. 2, will be found very convenient for hoisting the drags into and out of the bed.

The step *h*, Fig. 1, sometimes gives trouble by heating and cutting, owing to the weight upon it, unless carefully made and attended to.

Capt. E. E. Clough of Sparta, Union Co., Oregon, who has had many years experience with arrastras, and to whom I am indebted for valuable information in regard to them, recommends the step shown in detail in Fig. 3. A piece of steel *A*, 4x4x8 in. long, has in its upper end a semi-spherical recess 3 in. in diameter and 1½ in. deep. This is tempered to a

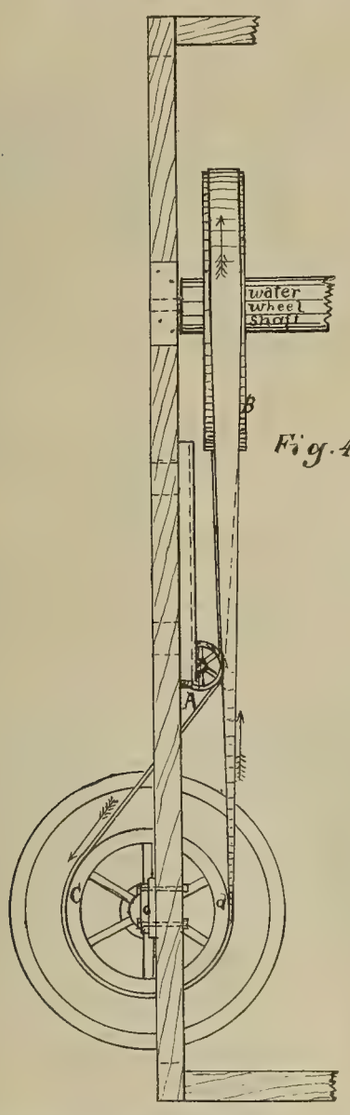

Fig. 4.

hardness that will barely turn the edge of a file, then fitted into the stump and tightly wedged. *B* is also steel, 3x3x9½ in. long, rounded on the lower end, to fit the recess in *A*. A collar should be welded around it 3½ in. from its lower end to afford more supporting surface. It is also tempered, firmly wedged in the shaft, the drag arms resting upon its upper end, with a piece of thin iron interposed. A little water once in two hours on this step is said to be all the lubrication acquired. The danger of grease getting into the pulp from this step is thus removed. The solution used for tempering the step was made up of 5 gal. of rainwater, 1 qt. of salt, 4 oz. saltpeter and 2 oz. of ash bark.

The cogwheels *H*, *H*, have six arms and the rims are made up of two ply of hardwood segments, well-seasoned and painted, to prevent shrinkage. The cogs are 2x4x3 in. long and about 5 in. and a small fraction circular pitch, or mean distance between centers. The mortises for them are 2 in. round holes. The driving-wheel is 8 ft. 6 in. and the driven wheel 6 ft. in diameter on pitch lines. They should be made by a good mechanic. The gudgeon in upper end of shaft *E* should be 3 in. in diameter and 18 in. total length, tightly wedged. The bearing may be of hardwood. The water-wheel shaft *I* should have wing gudgeons, running on either hardwood or cast-iron bearings, as the weight of the wheel may require. The water-wheel *J* has twenty-four arms 2x6 in. with braces *K*, *K*, and is 20 ft. in diameter with buckets 3 ft. wide, the rim being 9 in. deep. It requires about 80 miners' in. of water to drive it.

The overshot wheel is so well known that further description than is furnished by the drawings is not necessary. Some arrastra men believe its greater weight is an advantage in arrastra work over the more modern impact or turbine wheels. Whether or not this be correct, I am unable to prove from actual experience.

This will prove a strong and durable machine, capable of crushing about three tons in twelve hours. Should a lighter one be desired, it may be cheapened somewhat by omitting the mudsills, using plank or board staves for the rim and making the step by having the gudgeon in the shaft extend downward about 6 in., the end being cut off square and smooth instead of being rounded. Next tightly fasten a piece of gas pipe into the stump of suitable size to receive the gudgeon. Drop a number of loosely fitting discs of steel inside the gas pipe, leaving the hole of such depth that the shaft will be about 2 in. above the stump. The shaft may be driven by a quarter twist belt instead of cogwheels. A tightening pulley should be arranged on the slack side of the belt to bring it in line with the driving pulley. As shown at *A*, Fig. 4, the frame carrying the tightener pulley is set in grooves that it may be moved toward the arrastra when the belt requires tightening. A 10-ft. arrastra will require a 10-in. four-ply belt, though a 12-in. one would be better. Care must be taken to have the lower side of the driving pulley *B*, Fig. 4, about 1 in. above the level of the center of the driven pulley *C* and that the side of the latter pulley where the belt leaves it at *d* is in line with the center of the driving pulley *B*, otherwise the belt will run off the pulleys. The cogwheels are to be preferred, however, as a belt will sometimes slip—a most troublesome thing in arrastra work. Three arms may be used instead of four on smaller arrastras.

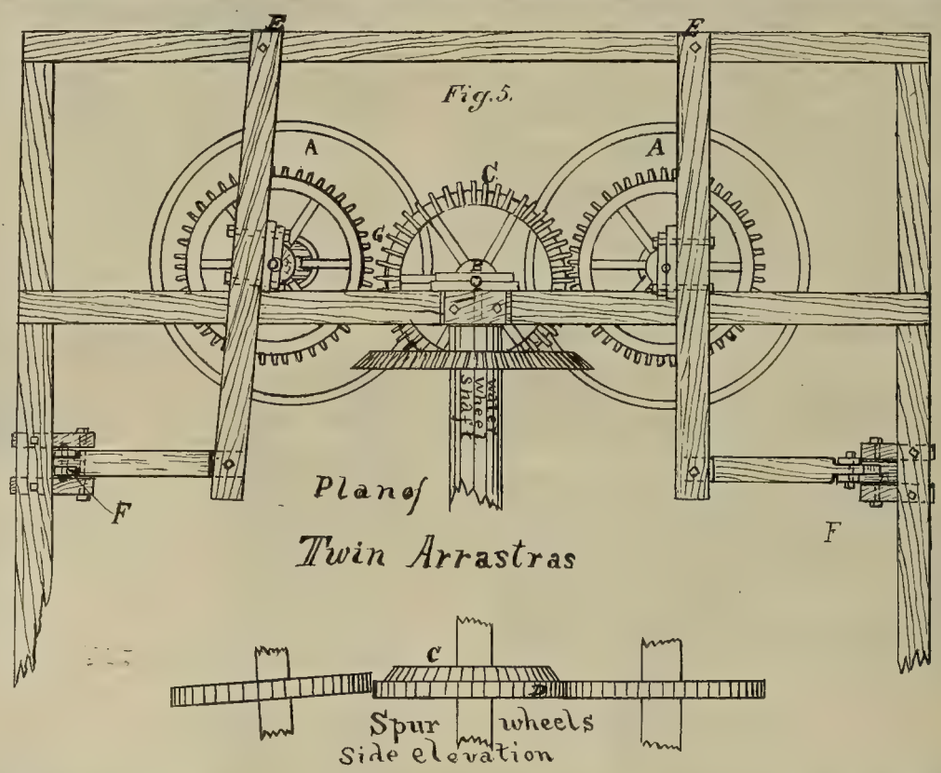

Fig. 5.

Where horses or mules are used as the motive power, but two are sometimes used. In this case, one of the arms are extended outward beyond the rim to be used as a sweep to which the animals are hitched as a span, where more than one is used. Where timber is scarce, the frame supporting the upper end of the shaft is sometimes dispensed with, the sweep revolving on a bolt in the stump and balanced by a weight on the end opposite the team. The vertical shaft, however, is to be much preferred. Where but two arms are used, two drags may be attached to one arm, one close to the stump and the other near the rim, while on the opposite side one larger drag travels between their tracks.

I know of an arrastra, designed by a Portland machinery firm, which was driven by a ⅝-in. cable-link chain. The bed was 36 ft. outside and 16 ft. inside diameter, leaving an annular track 10 ft. wide. The rims were of sheet iron, their upper edges reinforced by wood. There were twenty-four drag arms, having three drags each. These weighed from 1500 to 1800 pounds, aggregating over fifty tons of drags. It crushed from twenty-two to twenty-six tons of ore per twenty-four hours. Instead of being worked in charges, it was run with a continuous discharge through screens, the discharge pulp passing over amalgamated plates. Nearly all the gold, however, was saved inside. Between each of the twenty-four drag arms an extra arm was framed, making forty-eight all told at the periphery. The ends of each of these were banded, and had a strong iron fork inserted in them to receive the chain, which was guided by idle pulleys, and a tightener. It was necessary to remove a few links occasionally to take up the wear. The upper end of the shaft was held in place by guys, instead of framework.

Sometimes two arrastras, *A*, *A*, Fig. 5, are arranged to be driven by one water-wheel. These are termed twin arrastras. *B* is a vertical shaft on which the bevel wheel *C* has an additional spur wheel *D* (side elevation) built on beneath it, which drives the arrastra on either side by corresponding spur wheels. The upper ends of their respective shafts are attached to beams, which may be swung on a stout bolt at *E*, *E* by means of a lever at *F*, *F*. This is for the purpose of throwing either arrastra out of gear, as shown at *G*, without stopping the other. Instead of this arrangement, the opposite end of the water-wheel shaft may be elongated sufficiently to allow the arrastra shown in Figs. 1 and 2, to be duplicated, except that both should be built so either can be thrown out of gear when required. The plan shown in Fig. 5 has the advantage that the working of both may be more conveniently watched by the operator than when on opposite sides of the water-wheel.

The main advantages of twin arrastras are that the most convenient size for working is retained, and that one may be stopped when water is scarce. Where the water supply is ample for the season one desires to run, construction may be cheapened by building one of 15 ft.; which would have about the same capacity as two of 10 ft., provided the total weight of the drags were doubled, as it should be. It occurs to the writer that twin arrastras might be advantageously arranged to run with a continuous discharge and save labor and time by having one set about 2 ft. above the other. From the first, after grinding without mercury, the pulp would issue through screen about No. 1 size, and thence conveyed to the second, where it could be amalgamated and the crushing continued to the desired fineness, using probably a No. 9 or 10 screen. A silver-plated copper plate should be placed outside at a grade of not less than 2 in. to 1 ft. This plan would call for a continuous supply of water and ore, the latter being fed in quantities so small as to keep the pulp much thinner than when worked in charges, especially in the second arrastra. It should be stated, however, that we have never known of arrastras being so arranged.

When the water-wheel flume and ditches are finished, our arrastra is ready to run. Fasten one of the drags to the outer end of one of the arms by the chain, short enough that it may tend to lift the forward end a trifle and so it will travel as near the rim as possible, without touching it, the chain on the rear end, or "tail chain," being used to pull that end toward the center to throw the pulp in that direction.

The next drag, being fastened to the following arm, may travel near the center of bed track. The third is fastened to its arm, so as to travel as close to the stump as possible, its rear end being pulled toward the rim by the tail chain, to throw the pulp outward. The fourth is made to travel nearer the center of the track. However placed, they should be so arranged that their tracks will overlap, and result in an even wear of the bed, at the same time keeping the pulp as thoroughly mixed as possible. They may be changed end for end when necessary to equalize the wear.

Turn on enough water to run the arrastra about

fourteen revolutions per minute and begin throwing in the charge, adding a little water at intervals, to bring the pulp to about the consistency of thin mortar, the aim being to have it only thick enough to hold the uncrushed rock in suspension, as well as the mercury when added later. If too thin, the rock will settle to the bottom and grinding be greatly retarded. If too thick, power is wasted. By careful watching, one will soon be able to judge it correctly.

The charge for an arrastra of this size should weigh about 1500 pounds and be all in as quickly as it can be done, and, at the same time, keep the pulp of the right consistency.

This usually requires about thirty minutes. The time required to grind a charge will vary with the hardness of the rock; unless the drags are light or the rock harder than usual, from five to six hours will suffice.

Generally in three or four hours the charge will be found to be ground to a fineness of grain not exceeding one-eighth of an inch. A sample is horned, or panned out, and the amount of mercury required determined from the prospect so obtained.

This will require some practice. About 2 ozs. of mercury to each ounce of gold in the charge will be about the average required. Samples should be taken at short intervals afterward, to see that the mercury is being thoroughly distributed through the pulp.

The amalgam should also be examined, and if too hard, more mercury should be added until brought to about the consistency of fresh butter. Watch the pulp carefully that it does not become too thin, for by strict attention to these seemingly trifling details is success only to be attained. Usually in about two hours the free gold will all be taken up by the mercury; but this must be judged by careful testing, and when it has taken place the operator may begin to "wet down" the charge, first slowing the arrastra down to about ten revolutions per minute, and gradually adding water enough to allow the coarser grains of ore to be ground as fast as they settle. By placing one's ear against the rim, the grinding sound will assist in judging the amount of water required. Usually in from thirty to forty-five minutes the amalgam will all have settled into the crevices of the bed. If not, then continue adding water carefully until it has so settled and a careful testing fails to reveal any amalgam or mercury in the pulp.

The charge is now ready to be drawn off. The amalgam plate outside the discharge gate having been dressed, the gate is carefully raised a very little at first, testing the tailings and watching the plate for indications of escaping amalgam, until the charge is all run off, when the arrastra is recharged, and the same operation repeated until a cleanup is made, which is usually after from twelve to twenty charges have been ground. There seems to be a difference of opinion in regard to the best method of running off the charge, some preferring a series of 2 or 3-inch holes instead of the gate, and drawing off from the top first, and so on down to nearly the level of the bed.

It would seem the latter way, though slower, would be the safest, but Capt. Clough, whose experience lends his opinion much weight, favors drawing off from the bottom, on account of being so much quicker, and entailing no appreciable loss if the amalgam has been properly settled.

Should drawing off from the top be preferred, it may be done by using, instead of the gate, strips of 1-in. board 2 in. wide, and long enough to extend into the grooves in the sides of the gateway, removing them from the top, one by one, as the level of the pulp is lowered. Study to avoid grinding the amalgam by keeping the crevices open to receive it. Careful attention to the amount of water used will greatly assist in gaining this result.

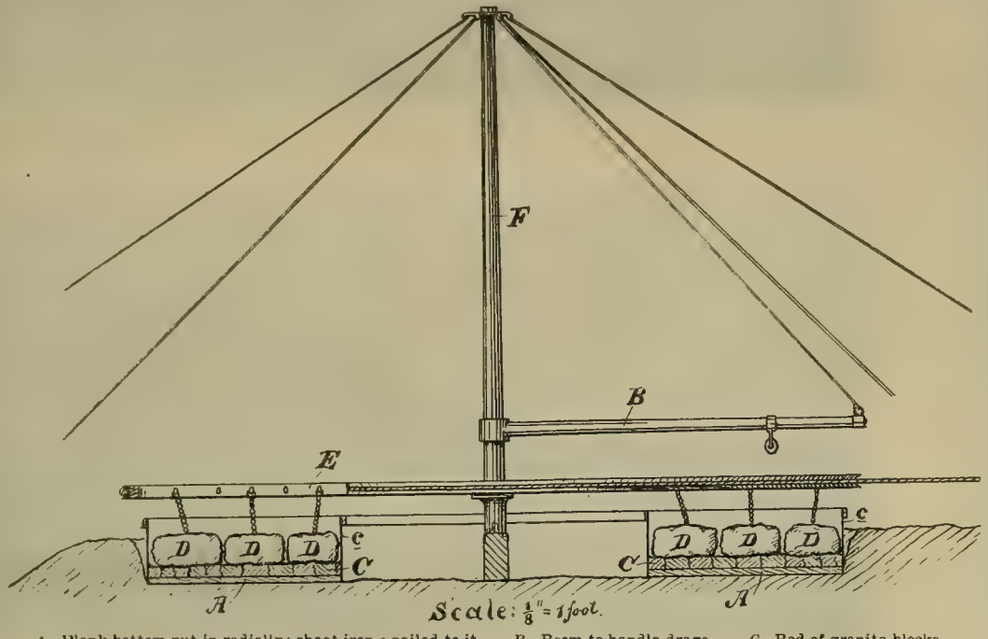
Chemicals are not often used, except occasionally a little salt or ashes, or both. We recommend, however, a few handfuls of quicklime when settling, to assist in coagulating the mercury and counteract any tendency to flour.

When the work has been carefully managed and the gold is reasonably free the saving should be not less than 95%, better results than these being quite common among experienced arrastra men. Capt. Clough states that he has dissolved a $20 gold piece in aqua regia and recovered 95% of it in a thoroughly clean arrastra, grinding rock totally barren.

Great care should be taken to prevent any particle of grease from finding its way into the pulp, where it would cause much loss. The number of revolutions of smaller arrastras should be increased that the drags may run at the same speed as those above described. From 10 to 12 ft., however, seems to be the size generally preferred. At best it will be found a tedious process, however, and the owner of one of these machines will probably soon find himself longing for some cheaper and more rapid means of crushing his ore.

When closing down for the season support the water-wheel shaft by a post to keep it straight.

Finally, it should always be remembered that good judgment and the most vigilant attention to every detail is as essential to successful work with an arrastra as with a stamp mill.



A—Plank bottom put in radially; sheet iron *c* nailed to it. *B*—Boom to handle drags. *C*—Bed of granite blocks. *D*—Drags. *E*—Drag arms and forks in their ends to receive driving chain. *F*—Center post, upper end supported by guys. Charged by driving a wagon onto a platform over the bed and dumping it.

Electricity in Mining.

It is not a difficult matter to convey to managers of mining properties an understanding of the chief terms of electrical parlance, by comparing these terms with the various conditions of water—that agency with the action of which none are more familiar than miners themselves. As one miner's inch, the unit of volume of water, delivered under a pressure of 480 feet head, will produce one mechanical horse power, so will one ampere, the unit of volume of electricity, if delivered under a pressure of 746 volts, produce one mechanical horse power. The analogy is practically perfect and the busy man of mining affairs who has to do somewhat with electricity need not necessarily delve into electro-techniques beyond that depth which returns the understanding that almost every electrical term in every day use finds an analogue in a familiar utilization of water.

It has been shown that the ampere is comparable to the miner's inch, and that the volt is comparable to the head-in-feet, or the pressure of a stream of water. The power obtainable from a stream of water may be found in the product of its weight and velocity—this product being expressed in "foot-pounds"—and there are 33,000 foot-pounds to a horse power. Similarly the power obtained from a current of electricity is found in the product of its amperes (weight or volume) and its volts (pressure or velocity) — this product being expressed in "watts"—and there are 746 watts to a horse power. Where any power of considerable magnitude is under consideration, its equivalent in watts would be so great numerically as to be inconvenient of expression, hence the Greek prefix "kilo," signifying 1000, is used exactly as in the metric system, and thus the energy of 175,000 watts is expressed as 175 kilowatts. Since in the watt is represented the product of volts and amperes, it obvious that 175 kilowatts, for instance, may represent an energy of 10,000 volts and 17.5 amperes, or that the two factors may have any value which will give 175,000 as their product. Here the cited analogue still holds, for the same is true of the energy of a stream of water when expressed in foot-pounds.

But water in flowing through a pipe line encounters resistance from friction with the sides of the pipe and from bends or other changes in the direction of flow. Hydraulics characterize this resistance as the "co-efficient of resistance," which is a variable quantity, and which is not expressed in terms of standardized unity. It is practically in the same manner that a current of electricity, in traversing a wire, encounters resistance, the amount of which varies greatly with the metal of which the wire is made. Silver offers the least resistance of any metal to the flow of electricity; copper has about 98 per cent of the conductivity of silver, while iron has less than one-sixth of the conductivity of copper. In electricity the unit of resistance is the "ohm" and its value is such that when a pressure of one volt is applied to such a length or cross-section of wire that the current which flows through the wire will be one ampere, then the resistance of the wire will be one ohm. A parallel to this would be found in hydraulics where the length and diameter of a pipe is such that under a head of 1 foot, exactly 1 miner's inch of water would flow through the pipe. The co-efficient of resistance of this pipe is analogous to the term of "ohm"—the unit of electrical resistance.

Electricity, if of the direct current form, traverses the conducting wire in one direction, as does water in a pipe line. Sometimes pulsating currents are used and these, like water in the supply pipe of a hydraulic ram, flow in a single direction, but are interrupted periodically. Then there are alternating currents of electricity which are of a vibrating character and oscillate in one direction and then in the other, alternately, as water would do in a pipe, each end of which is connected to a respective side of a piston chamber having no valves, in which event the direction of flow of water through the pipe would alternate with the direction of the piston stroke.

An oscillating current of the form described, in which electricity flows back and forth as water in a pipe connected to a piston chamber without valves, forms the simplest type of alternating currents, and such a current is termed a "single phase" current. This may be fixed in mind by conceiving the water device to be driven by a single piston, actuated from a single crank disc, throwing the water in the pipe into a state of single oscillation or single alternation —technically "single phase." The rate of this oscillation, when applied electrically, is termed the "periodicity," or the "rate of alternation" of the circuit.

Suppose, however, that there are two such single pipes, entirely independent from but paralleling each other, and containing water alternated in flow as in the previous instance, by valveless piston chambers. If the pistons of the respective chambers are always in unison as to speed and position as they would be were they driven from the same crank pin of a shaft, then the volumes of water in the two pipes would pulsate in perfect harmony as to rate, speed and direction, or to use an electrical term, the currents would be in "synchronism." But should the two pistons be actuated from independent crank pins placed diametrically opposite on the driving shaft, then the flow of water in one pipe would be exactly opposite to that of the water in the second pipe, which may be described as a "two current" or "two flow" system. It is precisely such a condition as this which exists in the two electrical circuits of the "two phase" alternating current electric transmission system.

Again, instead of the two valveless chambers and pipe system just described, assume that there are three such systems, each identical in construction to the others, with the solitary exception that the pump pistons are respectively driven from crank pins placed 120 degrees apart on a shaft, in which event the direction of flow in pipe No. 2 will be one-third of a stroke or revolution behind that in pipe No. 1. Similarly, system No. 3 will "lag" one-third of a stroke behind No. 2; system No. 1 will lag one-third of a stroke behind No. 3, and so on, all this being analogous to a "three-phase" alternating current system. Thus are illustrated the different types of polyphase systems—as all varieties of alternating currents in excess of the single phase system are termed.

But what is the advantage of different phases? Simply this: As hot water in flowing through a pipe influences the temperature of the air surrounding it, so does electricity in flowing through a wire influence the ether surrounding the wire—in fact, magnetizes it, the direction of magnetic pull (so to speak) varying with the direction of electric current flow. A north magnetic polarity and a south magnetic polarity will attract each other as all know, and owing to the fact that in two-phase systems the direction of electric current flow in the two circuits is always exactly opposite, the ether surrounding

one wire is always of exactly opposite magnetic polarity to the ether surrounding the other wire, hence in two-phase electric motors there is always a state of mutual magnetic attraction between that part of the motor containing the "leading" phase and that part of the motor containing the "lagging" phase.

Single phase circuits are by nature restricted to but a single magnetic polarity of the surrounding ether at a given interval, and as it takes opposite magnetic polarities to exert attraction toward each other, it is evident that the production of power from single phase current is seriously handicapped by its own inherent characteristic. This idea roughly explains why the development of single phase motors is so tardy.

In three phase systems, the phase impulses follow each other consecutively with absolute regularity, and inasmuch as "fields" or atmospheres of magnetism attend the appearance or disappearance of each impulse, it is evident that the revolving motion of these consecutive impulses impart a similar rotation to the attending magnetic field, which explains the term "rotating field." If a strong magnetic field revolves, obviously any magnetic body placed within that field will tend to revolve with it and to this principle is due the three-phase motor.

Finally, the transformer or converter is just what its name indicates, or rather, what its name would indicate were the word electricity prefixed. It is merely a device for automatically transforming electrical energy or "wattage" from one value to another. The transformer is to electricity what an appliance would be to hydraulics that would take the energy of a small stream of water at high head and transform it with but small loss to the energy of a large stream of water at low head, or vice versa. Were there an equivalent appliance in hydraulics, this "hydraulic transformer" could automatically convert the irresistable tidal flow, or any portion of it, to a much smaller volume of water at a tremendously high head, thereby enabling an easy solution of the long hoped for utilization of the tides for power purposes.

It must be borne in mind that the foregoing has been written with the idea of imparting most elementary ideas to those who have neither time nor inclination to become possessed of any but a superficial knowledge of the chief terms and principles which are fundamental in electrical practices. The wisdom of experience has well taught that "a little knowledge is a dangerous thing," and the above is a little, indeed a very, very little, of the knowledge of which science is possessed concerning electricity, and to accept every statement given as an indisputable exposition of most recent practices would be an error, for, as intimated, an elementary and brief explanation of a profound subject cannot be swerved from its purpose by considerations other than the barest generalities.—Electricity.

Some High Mines of Telluride, Colorado.

Written for the MINING AND SCIENTIFIC PRESS.

Herewith are given three views of a typical Colorado mining town, its general appearance and surface topography of a few of its mines. The upper illustration is of the town, the center one portrays Savage Basin, the lower, Silver Pick Basin. The higher peaks shown surrounding the latter are over 14,000 feet above the level of the sea—almost the same altitude as Mt. Shasta, Cal.—yet mining and milling are carried on the year round. The altitude of the mill in the foreground is 11,500 feet. The photograph from which that picture is engraved was taken last October, just after a light fall of snow. The Silver Pick mine is not appropriately named, as the ore is much richer in gold than in silver. The vein centers a basic dike of diorite, and is worked through nine levels, the lowest of which is at an altitude of over 13,000 feet: the ground remains frozen the year round. Through the nine levels the pay ore shoot extends from 400 to 800 feet, with an average value of $25 per ton. About 130 men find employment there part of the year, reduced to one-half that number in extreme winters. The sorted first-class ore is shipped to the smelters. A ⅞-inch wire rope tramway 5900 feet long connects the mine and mill, the latter showing low down in the foreground of the picture. Well up in the left-hand corner a darkly shaded spot on the right-hand slope of the gulch is the dump of the present lowest workings, level No. 7. There are probably few higher mines on this continent.

On the right of the central picture are depicted the Tomboy mill and mine, another famous property, which, although only four years old, has a record as a gold producer. The mine is operated through a tunnel from the mill, one-half mile long, though by the time this is in type the sinking of a three-compartment vertical shaft will have been begun. Three machine drills are used. The compressors which drive the drills and supply the mine with air are driven by steam power. The machinery of the mill is driven by 200 H. P. electric motors, the power being derived from the plant of the Telluride Power Transmission Co., thirteen miles distant. A full account of that enterprising concern recently appeared in the MINING AND SCIENTIFIC PRESS. This

company, which supplies electric power to a number of mines in this section, has recently extended its line over Mount Sneffels to a large mine in Ouray county, a distance from the generating station of over twenty miles. Where the line passes over the mountain the altitude is 13,500 feet above sea level. The generating station at Ames commands the water power of both the Lake and Howard forks of the Rio San Miguel, the former 1200 H. P. and the latter 750. There are eight transformers. Water is conveyed from Great Lake to the plant, a distance of over three miles, by flume and pipe line, with a fall of 901 feet, pressure 436 pounds to the square inch, in a nozzle 15 inches at its discharge. The velocity of the water is 14,520 feet per minute. The Howard fork line is one mile in length, fall 550 feet, pressure 250 pounds, and nozzle 15 inches. There are two dynamos, each 9 feet in height, two-phase alternating current, 1200 amperes each, step-up transformers to 10,000 volts on the line.

The Tomboy mill is about 12,000 feet above sea level. Since May 1st, '98, it has treated 40,000 tons of ore, averaging $10 per ton. It is free milling, and 90% of the mill product is sent to the Denver mint in the form of gold bullion. The output of the mine for the year 1897, according to the sworn statement of the manager, was $497,524.12.

To the enterprising Telluride *Journal* this paper is indebted for the use of the accompanying engravings.

Phœnix, Cal., Group of Gold Mines.

Written for the MINING AND SCIENTIFIC PRESS.

This mine is situated in the Sierra Buttes, one mile from Sierra City, Sierra county, Cal. The Buttes are famous, not only for their ruggedness and height, which make them a landmark visible from long distances, but as well for the very rich mines which are in them and which have yielded many millions of dollars in gold.

The Sierra Buttes consist mainly of a vast mass of quartz-porphyry, which rears its head to the height of 8615 feet above the sea and over 4400 feet above Sierra City, a mining town at its southern base.

On the southern slope of the Buttes, about 1600 feet above the valley of the Middle Yuba, are the outcroppings of the Phœnix ledge, which extends from the Butte mine easterly to the Mountain mine, two miles away.

The Phœnix mine consists of seven United States patent claims along this ledge and two claims on a parallel ledge higher up the mountain. These latter claims will be worked through a crosscut from the Phœnix tunnels.

Five hundred feet below the croppings, where the mine was first opened in 1866, the ledge has been opened through a cross tunnel 700 feet long. At the level of this tunnel drifts, each about 300 feet long, have been run east and west on the ledge. From above these drifts many thousands of tons of quartz have been mined and milled. According to a report made by G. W. Wait, M. E., the average mill returns from this amount of quartz was $7.11 per ton. He also estimates the amount remaining in that ore chute above the drifts and available for mining and milling to be 25,000 tons.

At the end of this tunnel a winze has been sunk on the ledge to the depth of 165 feet. But little quartz has been mined from below the level of the tunnel and drifts. The ledge of quartz exposed in this winze is about 7 feet wide at the bottom and will average over 4 feet. The average assay value of this quartz is $12.50 per ton and is free milling. The small per cent of sulphurets are worth about $200 per ton. The winze is provided at the tunnel level with an elevator hoist, which receives its electric energy from a dynamo in the mill. The tunnel is lighted by electricity. At the mouth of the tunnel is a blacksmith shop, and nearby there is a boarding house for the miners.

From the tunnel the quartz is taken to the mill, 800 feet below, by cars running on a wire rope tramway, 1100 feet long. A full car on descent pulls an empty car up, controlled by a brake.

The mill is a modern one and contains twenty stamps and all the accessories, except concentrators. There is room provided for these. Its capacity is sixty tons or more per day. It is lighted by electricity. Power for the mill is obtained from free water, running through a ditch and flume three miles long, belonging to the property. Abundance of water—even during the past exceptionally dry time—having a fall of nearly 500 feet, supplies all the power which will ever be needed for the purposes of the mine.

Three water wheels of the Pelton type are in the mill and are used to run the machinery for crushing, and also the dynamos for electric light and power. A tunnel will be run 1600 feet to the ledge to tap it 800 feet vertically below the present one, so that the quartz may be transferred directly to the mill, and thus be mined cheaper. Under the present conditions, mining and milling can be done for less than $2 per ton.

The property has been idle for several years because of litigation, which is now at an end. It has recently been purchased by Dr. N. S. Keith of San Francisco, and will be operated by him and associates.

Gold Mining and Milling in South Africa.

The following letter was written by a young Californian from Krugersdorp, South Africa, and while not exactly adapted to the columns of a technical journal, as it treats of everything in a general way without regard to detail, yet it is not without interest, as it is evidently written "first hand"—from personal observation:

I promised to write you some time ago facts that I could gather about the different cyanide processes as used here for the extraction of gold; and it is only since I came out here to the Lancaster mine that I have gained the desired information. I have picked up some other things also in regard to mining as it is carried on in the Rand that may be of interest.

The gold-bearing reef here is known as "banket." The first banket that was worked was found near the surface, was soon worked out and the mines abandoned. Then prospectors came in with their diamond drills, which have proved the reef and brought it to its present state of development. The diamond drill is a series of steel tubes, each about 10 feet long and screwing together with flush joints inside and out. The crown is of steel set with diamonds, so that it cuts a clearance inside and out for the barrel. It is revolved quite slowly, its own weight carrying it down, while water is pumped in at the top, reducing friction and flowing up on the outside, taking with it the cuttings, which are tested from time to time. Additional tubes are screwed on as they go down. When the barrel is pulled up the core sticks in the barrel. It is taken out and assayed when reef is struck.

The average size of drills used for prospecting take up a 1¼-inch core.

The hole may be put down to any depth or angle. There are five shafts on this property; two are vertical, the others at an angle of 45°, which is about the pitch of the whole reef until the deep levels are struck, when it flattens out more nearly parallel to the surface.

The reef is found at different depths, the paying levels being down 1000 feet or more. Then there are the deeper depths, which have not been developed yet. The reef in many places is found to be richer as they go down, and the whole reef contains a tremendous body of payable ore, so you see the companies here are justified in erecting large and expensive plants.

The ore is hauled to the top of the headgear, where the skip dumps itself. If it is waste, a trap is opened and the load enters the waste bin. If ore, it slips over the grizzly, which takes out the fine stuff and enters the ore bin. The fine material is all sent to the crusher house. The larger material is drawn from the bin, sorted, taken to the breaker which reduces it to a suitable size for the crusher or stamp mill; after passing through the stamps, over the amalgamated plate and riffle which takes out the greater part of the gold.

Now we come to the cyanide treatment. After the sand and water leave the battery house it runs into a large wheel, belt-driven, which elevates it so it will flow into the receiving tanks. There are six of these tanks, built of iron, and about 12x40 feet, supported on iron columns above the treating tanks. These tanks are set on masonry, which is open below so that the cars can be run under, the manholes opened and the tanks emptied. The tailings from the battery house can be turned into any one of the six receiving tanks.

The stream enters the center of the tank, into an arrangement something like the old-style lawn sprinkler which turns slowly around, spreading the tailings evenly over the bottom of the tank. There are several outlets in the sides and bottom of these tanks, covered with fiber mats. The water passes through these, taking only a very small quantity of sand with it, which is caught in settling boxes.

When the tank is full the tailings are turned into another tank. Now we have here what is termed a tank of slimes. The manholes are opened in the bottom of the tanks and the slimes emptied into the treating tank below, where a solution of cyanide of potassium is pumped on it and allowed to stand ten days.

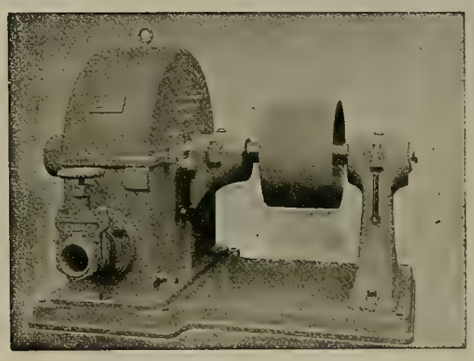
There are various devices used to stir up the slimes and allow the cyanide to act. After ten days the cyanide solution, which now contains a large percentage of gold, is filtered out through fiber mats in the bottom. When empty the slimes are discharged through manholes and hauled to the dump.

There are two processes for getting the gold back into a solid state again: the MacArthur-Forrest process, by which it is treated by acids and precipitated on zinc shavings, and the other, the Siemens & Halske process, which is used here as follows:

The plant consists of four wooden tanks about 5 feet wide, 4 feet deep and 30 feet long, and each is divided into twelve equal parts, so arranged that the cyanide enters the top of the first and flows through a small slit near the bottom of the second, and from the top of this to the third, and so on from top to bottom to the last. In each section of the tanks and parallel to the flow of the cyanide are the negative and positive plates, there being twelve in each section of the four large tanks. The positive plate is of sheet iron covered with sacking, and the negative plates that receive the gold are of strips of thin lead foil hung on a copper bar.

The four large tanks are connected in series to a 15-volt dynamo, the sections in each box being parallel to each other. The cyanide, as it flows slowly through each of the twelve sections of the tank, carrying with it gold in solution which is electrolytically deposited on the lead, now reaches the last section of the tank containing now but a slight trace of gold. It is then taken to large iron tanks where it is tested and new cyanide added to it, and so used over and over again. Once a month the lead foils are taken out and sent to the Rand Ore Reduction Co., where the lead and gold are separated.

The Pelton Water Wheel Company



Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

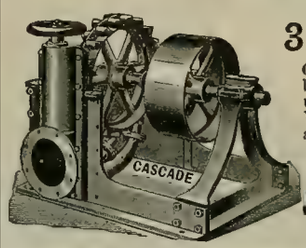
Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 AND 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL



Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of **33 YEARS** building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

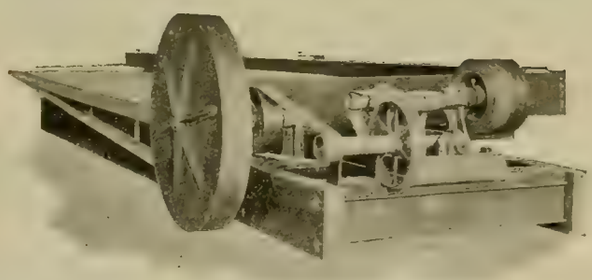
WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

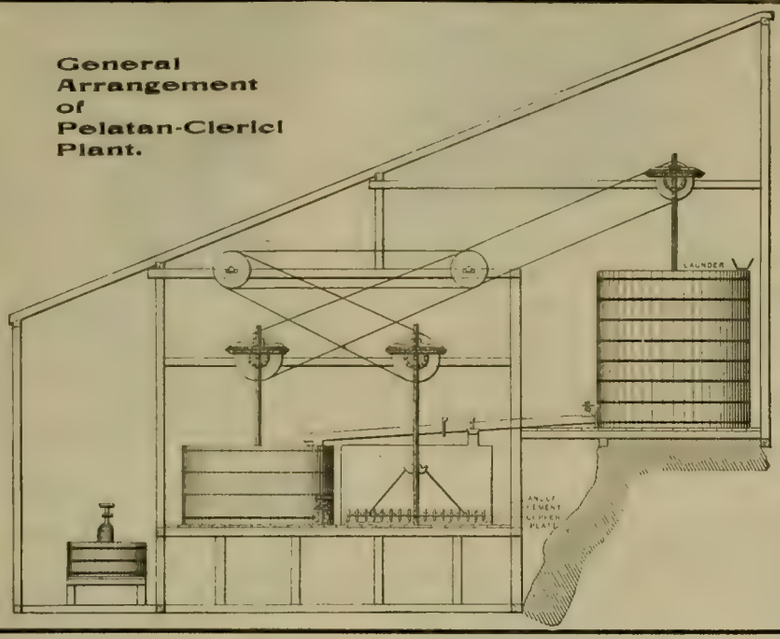
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 18 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold and silver from raw material than any other process. Cost of treatment is less. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90% of values by bullion returns. Simplicity. Economy. Efficiency.

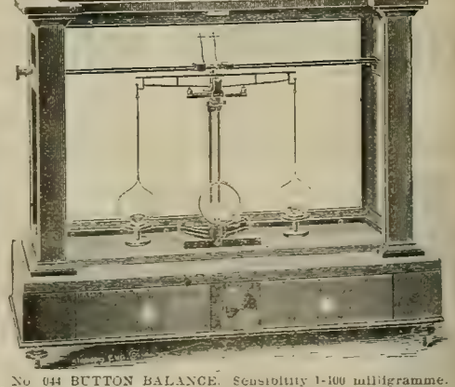
Operating taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.
If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and holding it in the position shown, take your readings in less time than you can place any other instrument. Send for descriptive catalogue B to



No. 044 BUTTON BALANCE. Sensibility 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark  or

Our German drawing instruments bear only the trade marks or

We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Paragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

GOLD FOUND quicker by using a Moore Sinking Pump.

Because the price is low enough to own a sinker and discard a skip and the delays as well as troubles it causes. Call or write to any of our sales agents or our Denver office. Don't buy a sinker until you have examined the MOORE. Simplest. Lightest. Cheapest.

DEWEY, STRONG & CO.,

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

An Improvement in Modern Stamp Mill Practice.

GLOBE BATTERY STEM GUIDE.

PATENTED AUGUST 24, 1897.

RIGID. SIMPLE. DURABLE. EFFICIENT. ECONOMICAL.

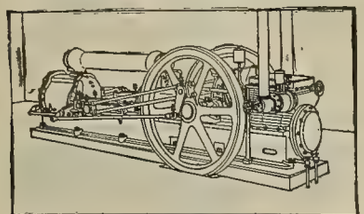
Effect a Saving in Friction Losses. No Trouble to Install. No Alterations of Mill Necessary. No Keys or Wedges to Adjust.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.

Manufacturers of All Classes of Mining Machinery. Estimates Furnished.

OFFICE OF WILDMAN GOLD MINING COMPANY. SUTTER CREEK, CAL., June 28, 1898.

Globe Iron Works, corner Main and Commerce Streets, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far do not show any wear either on the Guides or the Stems. They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. It is our intention to replace all of our Guides with those of your make, and I cheerfully recommend them to any one desiring a good, serviceable and economical Guide. Very truly yours, JOHN ROSS, JR., Superintendent.



THE NORWALK Air and Gas Compressor.

In use in every State in the Union, Central and South America, Great Britain, etc. Also by the U. S. Army and Navy.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. CAPACITY FROM 5 TO 10 STAMPS.

32 FIRST STREET, SAN FRANCISCO, CAL.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 26, 1899.

SILVER. — London, 27 5-16d; New York, 59⅛; San Francisco, 59⅛; Mexican Dollars, 47¾@48. New York exchange, sight, 17½; telegraphic, 20 cents premium.

LEAD. — New York reports "firm" $4.25 bid, $4.27½ asked. The firm naming the settling price for leading miners and smelters at the West quotes Lead at $4.05.

Local, pipe, 6@6¼c; sheet, 6½@7c; pig, 5¾c; bar, 6c.

Four-dollar lead sounds good to the majority of Colorado miners, says the Denver *News*, and is welcome news in the Utah and Idaho camps. This was the smelter quotation yesterday. It was not seen on the boards before since Sept. 8th, '97, when it lasted until Oct. 15th. The day following there was a sudden drop to $3.75 per 100 pounds, and the average for all of '98 was $3.63. The production of lead in the United States last year was 305,459 short tons, compared with 289,835 in '97. Heavy gains were made in Missouri, Kansas and in the Cœur d'Alene district of Idaho. The gain in Colorado was also marked, reading 50,772 tons at $72.60 per ton, as compared with 41,026 tons at $67.60 in '97.

COPPER. — New York reports Lake "strong," $15.75 bid, $16 asked. Local, bar 20c per lb.

According to the official figures of copper production in the United States there was an output from the Montana, Lake Superior and Arizona mining districts in '98 which exceeded that of '97 by over 18,000 tons. The close of the year, however, notwithstanding the large production, found stocks almost exhausted both in this country and in Europe. John Stanton, the statistician of the copper industries, takes the view that higher prices must come and that still greater increase of production will be necessary to meet growing demands. He says:

While the production of copper for '98 shows considerable increase over that of '97, and is by far the largest production ever made in this country, the consumption has also been very large, especially since the close of hostilities with Spain. Stocks in Europe, as well as in the United States at the close of the year, were unusually low, there being practically none in sight. As a consequence, copper has been making very rapid advances, and it has been rather hard to keep track of it for the past two weeks or so. I should say that 16 cents is a fair price for copper to-day, and that represents the highest figure reached in many years. Consumption is so large that it looks, too, as if a higher figure will be obtained.

The peculiarity of copper's position is that during the last few years of depression the production has constantly been increasing, and yet consumption has carried it all off. European stocks have been steadily declining, until now they have reached the lowest point ever known. The electrical industry is a very important factor in the copper business, and its need of copper is growing greater. Wherever railway or other construction is going on there is always a large demand for copper in the form of brass and a variety of other articles. And as the electrical business advances by leaps and bounds it is no easy matter to tell what quantity of copper will in this way be absorbed.

Now that a betterment in business generally is being felt, a great stimulus has been given to the opening of new mines and the development of copper properties. It is apparent that the existing mines have not capacity to furnish the quantity that will be needed in the near future. Companies with good prospects of becoming producers find that their shares are eagerly sought after, and it is the general belief that for some time to come copper mining will prove profitable.

A good deal has been said on the subject of a copper combination. It is quite possible that a combination of certain interests may be effected, but as to a general combination of one between the largest producers, that is simply absurd. I don't think there is any foundation for it at all. Some groups of mines have a tendency to consolidation, being owned and controlled by practically the same men, but where interests are very distinct it would be difficult to arrive at any basis by which consolidation could be carried out equitably. In my judgment, there is no foundation for stories of general trust or combination.

At present there is no difficulty in selling copper at good prices. Everything that is offered is eagerly taken up. Those who have it to sell must look upon the outlook as highly encouraging.

The brokers' price for copper to-day was $16.25.

IRON.—American, soft, $21.75 and $23.75 per ton; Scotch, $24.25. Local bar, 2¼c per lb.

SPELTER.—3¾@9.

TIN.—Pig, 22c per lb.; Bar, 25c. New York reports an advance, $32.20 bid; $32.40 asked.

To-day's *Iron Age* says: "The most interesting developments during the week have been in connection with the tin plate industry. The same parties who carried through the consolidation in this industry are reported to have perfected now a fusion of the leading makers in the central West of tin plate bars, five great plants being named, situated at Youngstown, Newcastle, Columbus and Wheeling. It is reported that arrangements have been made with one great establishment in Pittsburg and another in the Wheeling district to secure exclusive control of this branch of raw material. In other words, outside mills are to find it difficult to obtain the tin plate bars.

"Another important step in the same direction is the completion of the arrangements with foundries and machine shops which make a specialty of tin plate machinery to control their capacity for a considerable period. The effort evidently is to keep out a rush of outside capital into the business."

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California. location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1899, an assessment (No. 12) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. MEITMANN, Secretary.

Office—237 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of January, 1899, an assessment (No. 20) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 21st day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of January, 1899, an assessment (No. 17) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1899, an assessment (No. 115) of Twenty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on TUESDAY, the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1899, an assessment (No. 16) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of February, 1899, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 11th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

TO WHOM IT MAY CONCERN:

Any one desirous of buying my book, "Hints on Amalgamation," to appear March 1st, '99, should address the publishers, The Modern Machinery Publishing Co., 218 La Salle St., Chicago, Ill., as I shall be absent from San Francisco for an indefinite period. W. J. ADAMS, E. M.,
132 Market St., San Francisco.

DELINQUENT SALE NOTICE.

NATIONAL CONS MINING COMPANY.—Location of principal place of business, San Francisco, California. location of works, Rich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 5th day of December, 1898, the several amounts set opposite the names of the respective shareholders as follows:

	No. Cert.	No. Shares.	Amt.
G. Schmitt	46	1	$ 10
G. Schmitt	53	1000	100 00
G Schmitt	57	500	50 00
G Schmitt	60	500	50 00
G. Schmitt	156	100	10 00
G. Schmitt	152	25	2 50
G. Schmitt	147	119	11 90
G. Schmitt	175	100	10 00
G Schmitt	167	4	40

C. Smyth	222	60	6 00

And in accordance with law, and an order from the Board of Directors, made on the 5th day of December, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, 773 Mission street, San Francisco, California, on WEDNESDAY, the 14th day of February, 1899, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

DELINQUENT SALE NOTICE.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 22) levied on the 3rd day of December, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
H. F. Anderson	93	2,000	$60 00
Calvert Meade, Trustee	196	200	6 00

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of December, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 106 Liedesdorff street, San Francisco, California, on MONDAY, the 30th day of January, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale. CALVERT MEADE, Secretary.

Office — 106 Leidesdorff St., San Francisco, Cal.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from S. S. Taylor, in the Silver Star Flume and Mining Co.'s Mine, near Spanish Ranch, Plumas Co., to deposit tailings in a worked-out pit; from H. S. Byam, in the Bonanza Claim, in Amador Co. near Michigan Bar, to deposit tailings in Arkansas Creek; and from the Badger Hill and Cherokee Gravel Mining Co., in the Badger Hill Mine, at Cherokee, Nevada Co., to deposit tailings in a worked-out pit, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 30, 1899, at 1:30 P. M.

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POSTPAID. Following is a partial list:

ASSAYING:—PART I— GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 130 pages, illustrated....$1

ASSAYING:—PARTS II & III—GOLD AND SILVER BULLION, LEAD, COPPER, TIN, ETC.
Latest edition; 161 pages, illustrated, cloth. Much of the original text replaced by new matter....$1 75

PROSPECTOR'S FIELD BOOK AND GUIDE:
By H. S. Osborn....$1 50

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus....$3

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast....$2

THE EXPLORER'S AND ASSAYER'S COMPANION:
Third edition. By J. S. Phillips. A practical exposition of the various departments of Geology, Exploration, Mining Engineering, Assaying and Metallurgy. An exceeding valuable work....$6

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated....$5

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson, E. M....$1 50

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall....$2

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50c

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions. Well illustrated. Cloth....$2 50

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G W. Lock, 472 pages, illustrated, flexible leather....$5

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth....$4

ALLOYS:
Thurston, 2nd edition....$2 50

ASSAYING:
Furman, 4th edition....$3

HIGH EXPLOSIVES:
Eissler....$4

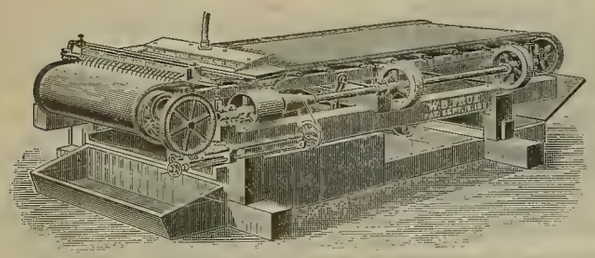
This Paper Fifty-Two Times, POST PAID, $3.00

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

The Bursting of Small Cast Iron Flywheels.

Within the last few days have been reported disasters involving loss of life and destruction to property by the bursting of cast iron flywheels. Among others may be noted, at Youngstown, Ohio, the bursting of a flywheel in the bar mill of the Brown-Bonnell Co., wrecking the engine and engine house, and inflicting damage to the amount of $5000, and a similar accident in Lorillard's tobacco factory, Jersey City, N. J., killing two people and probably fatally injuring two more. In view of such frequent disaster, the accompanying article is of timely interest. It was written by Chas. H. Benjamin, and was presented at the recent meeting of the A. S. M. E:

Of late years the failures of large flywheels have become alarmingly common. Every month brings ts record of one or more disasters of this sort, some of them entailing loss of life and serious destruction of property. It is not the purpose of this paper to discuss the causes of such accidents, further than to notice the fact that the high belt speeds and close regulation required in electric plants have been indirectly responsible. Many of the flywheels have failed on account of excessive speed due to disarrangement of the governor and consequent racing of the engine. In some instances it has been difficult to determine the cause on account of the destruction and excitement at the moment. In no small number of instances, however, the wheels have burst at speeds but slightly above the normal and when the factor of safety was apparently ample.

J. Stanwood of this society was the first to point out the condition of stress existing in a flywheel rim and to show that the bending due to centrifugal force might reduce very materially the bursting speed. This subject was further developed by Prof. Lanza, and the probable amount of stress due to bending was indicated, as well as its effect upon rim joints. It occurred to the writer that a series of experiments on small cast iron wheels might throw some light on the causes of failure and lead to more rational formulas for design. The quality of the metal in a small wheel is better than in a large, and the stresses due to uneven cooling are much less. The linear speed of rim at which a large wheel will burst will therefore be less than that obtained by experiments on small wheels. The experiments about to be described were conducted under the immediate direction of the writer at the laboratories of Case School of Applied Science, and he was present at the bursting of nearly every wheel. Acknowledgment should be made of the

TABLE OF CONTENTS.

ILLUSTRATIONS.—Showing the Bursting of Small Cast-Iron Flywheels, 117-120-121. Commodore G. W. Melville, 121. Latest Mining and Metallurgical Patents, 123.

EDITORIAL.—The Bursting of Small Cast-Iron Flywheels, 117-120-121. The Advance in Lead; Meeting of the American Institute of Mining Engineers; Ways and Means of Irrigation in Wyoming; Guessed that Copper and Poles Would Advance in Price; Mining Should Have a Separate and Distinct Place; The Modern Frankenstein; The New Force; Questions of Riparian Rights; To Prevent Possible Fraud; Electricity Direct from Coal; Protection to Patents or Trademarks in France, 118.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 127-28-29.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 142.

MISCELLANEOUS.—Concentrates, 119. Commodore G. W. Melville, 121. Minting Gold and Silver; An Official Ruling; The Standard Oil Copper Trust; Paper Factory at Niagara Falls, 122. Latest Mining and Metallurgical Patents; Patent Office Requirements, 123. The Genesis of Petroleum and Asphaltum in California; The California Water Wheel, 124. The Copper Deposits of the "Seven Devils," Idaho; Cyaniding Base Ores, 125. Mining as a Legitimate Business; Disbelief in the "Ancient River" Theory, 126. Industrial Notes; Personal, 129. Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Recent California Mining Incorporations, 131.

THE advance in lead is indirectly an advantage to silver-lead producing properties, as, ordinarily, with lead at 4½ and silver at 59½ it is about the same as were lead 3.60 and silver 63.

BEGINNING on the 21st inst., the American Institute of Mining Engineers will hold its 76th meeting in New York City. It is expected that the next meeting of the association will be held in San Francisco.

THE report of Wyoming's State Engineer is devoted mainly to discussion of ways and means of irrigation. Like California, Colorado and other States and Territories, that subject is felt in Wyoming to be one of present commercial interest. The recent movement toward the conservation of water and forest preservation, started by the California State Miners' Association, is in the line of practical progress and deserves hearty encouragement and co-operation.

THE ability to rightly guess what will occur is one of the most common means of making money. Boston papers tell of a Massachusetts telephone company whose manager guessed last September that copper and poles would shortly advance in price, and accordingly contracted for the delivery in '99 of 5,000,000 pounds of copper at a price 2 cents below prevailing figures. He also contracted for 100,000 poles at a price 20 cents below present local quotations. Were he so disposed, he could sell his two contracts at a present profit of $120,000.

IN the issue of Dec. 24th, '98, about a column was given on this page setting forth the fact that while other comparatively unimportant details were provided for in the Congressional bill for the 12th U. S. census, the great industry of mining was not by the framers thereof deemed of sufficient importance to have separate and distinct place, and that, so far as the bill was concerned, there was not a word in it that would lead anyone to suppose that there was such a thing as a mine in the United States. To supply so glaring an omission, to obviate such absurdity, and in justice to the basic national industry that fosters and advances all others, Congressman De Vries of California drafted a provision as soon as his attention was thus directed to the matter, and which he has been able to have reported favorably by the Committee on Census. It will doubtless be incorporated in the bill and passed. The addition provides for a census of the gold mining industry, the number of men employed and where, the kind of mines and their proportionate output, with other statistics relative to the business. It is further provided that this information shall not slumber in dusty archives till 1908, but shall be immediately printed in a separate volume and distributed in 1901.

The Modern Frankenstein.

Nothing is more noticeable in '99 in the mining and industrial field than the abnormal creation of combines and "trusts" throughout the country. The ordinary tendency to such business combinations is accountable because of the arguments so readily adduced. Economy of management; freedom from vexatious competition; ability to control the market, local and foreign; opportunity to dispense with numerous employes; ease of centralized action; these are among the arguments used by the promoters of the gigantic trade and manufacturing combinations so frequent in the past five years, and such commercial arguments appeal so strongly to investors in "industrials" that consolidation has been a general fashion. During '98 eighty-eight trusts in many leading lines of industry were established in the United States, with a total aggregate capitalization of $1,292,749,200. But even last year's famous record seems destined to be eclipsed by that of this year. The month of January has witnessed a craze in the direction of trade combinations in which the most conservative business concerns share, and sober, steady institutions advised by equally staid banks are going headlong into the business of consolidation. So far in '99 additions have been made to the list of business amalgamations, till it is believed that at this writing nearly 65% of the great manufacturing corporations of the country have begun to take part in such consolidation. This state of affairs has been greatly aided in '99 by the present general willingness of the banks to rescind their former rule in this matter, and accept the stock of such combinations as collateral for loans.

It will be interesting to note how far this thing will go before the inevitable reaction; for the business pendulum always swings as far one way as the other. Despite the ability to control legislation, corrupt legislators, defy judicial decisions and ignore suggestions of anything not prompted by avarice, the trusts cannot become a permanent feature of American industrial life. However huge they may be, the immutable laws of business will endure and work their ultimate outcome. Stock in rival concerns may be bought at far beyond its actual value, factories may be absorbed and laid idle, good will may be made the subject of capitalization, employes who built up the business and made it worth the taking in may be discharged, economies may be practiced, and the price of products enhanced while the cost of production is lowered, and all things may for a while appear to be prosperous, but such business success is not permanently founded and will surely prove ephemeral. The reason is plain: Sooner or later will come upon such speculation, born of confidence, a blast of distrust, and then, when everyone is trying to unload, will simultaneously come the crash. If ever caution was needed among business men, it is now. Confidence is a plant of slow growth; steadily since '93 it has been unfolding; it were a pity if its further growth were to be so rudely checked.

The New Force.

Considerable space has been devoted herein to recent researches resulting in the production of liquid air, and of late it would seem that the product had advanced from a "scientific curiosity" to a feasible proposition for commercial use, in this way following the line of nearly all great industrial inventions and discoveries, which, originating, subjectively, in some clever brain, ultimated, objectively, in the world's advance. We are not, however, prepared to implicitly accept the enthusiastic statement wired by Prof. Tripler this week, wherein he asserts that he has not only "solved the problem of harnessing this great power to machinery," but continues by saying: "My engine for this purpose works, and it requires only the perfection of a few mechanical details to realize its enormous utility as a motor for all kinds of machinery—for railroad trains, steamships, factories: in short, wheresoever great force is required, from propelling navies to firing guns and blowing up cities and forts. Liquid air is from twenty to one hundred times more powerful than steam, according to the amount of heat applied. Even with the heat of the surrounding atmosphere, its expansive force is twenty times greater than steam." This seems like creating an atmosphere in which to flap the wings of fancy, and while it is conceded that Prof. Tripler has carried the doctrine of compressed air to its logical conclusion by liquefying air, and that he is able to produce it in commercial quantities, yet there will continue the usual amount of popular incredulity, that can only be removed by the "perfection of the few mechanical details" of which the professor writes. If the truth should approximate his assertions this week it means the creation of a new force more potent constructively and destructively than anything which is at present known to exist.

IN Colorado water cases U. S. courts seem as pliant as in California regarding questions of riparian rights. In the issue of the 14th ult. was noticed at some length a ruling in this State thereon which, if finally upheld, would result in considerable disturbance. But at St. Louis, last week, the U. S. Circuit Court announced a decision that exceeds in extent the recent San Francisco case. New York men owned 715 acres placer ground on both sides of the north fork of the San Miguel river, Colorado; work thereon was abandoned in '91; recently Denver men began to take water from the river, lower down, and were enjoined by the New York owners of the placer ground lying on both sides thereof, on the ground that they owned the river. The Denver owners' attorney admitted that complainants owned placer land thereon, but contended that a river could not be the subject of private ownership. The judge, however, decided that it could, and held in favor of the New York men. The case was, of course, appealed. Should, in all unlikelihood, the appellate court affirm the decision it will be in order for enterprising men everywhere to buy little holdings of placer ground lying on either side of flowing streams, and thus secure private ownership of the whole river. The possibilities of such legalized acts would be alluring.

IN the California Legislature, as amendatory to an Act passed in '71, for the protection of stockholders, Assemblyman Caminetti has introduced the following with intent to prevent possible fraud:

"Any bona fide stockholder of a corporation formed under the laws of this State for the purpose of mining, shall be entitled to visit, accompanied by his expert, and examine the mine or mines owned by such corporation, and every part thereof, at any time he may see fit to make such visit and examination; and may take from any part of the mine samples of the ore and samples from the tailings, paying therefore, if demanded by the superintendent, the reasonable value of such samples, and when such stockholder shall make application to the president of such corporation, he shall immediately cause the secretary thereof to issue and deliver to such applicant an order, under the seal of the corporation, directed to the superintendent commanding him to show and exhibit such part of said mine or mines as the party named in said order may desire to visit and examine. In case of the failure or refusal of the superintendent to obey such order, such stockholder shall be entitled to recover in any court of competent jurisdiction the sum of $1000 and traveling expenses as liquidated damages."

ELECTRICITY direct from coal is still and likely to be an unfulfilled dream. At the Milwaukee, Wis., meeting of the Northwestern Electrical Association, on Jan. 19th, an interesting paper was presented on this subject, which, after giving a resume of all the research in that direction for several years, concluded as follows: "While the problem of obtaining electricity from carbon direct has not as yet received a practical solution, it cannot be regarded as insoluble. The chance for success, however, would seem much better in endeavoring to oxidize the easily obtained hydrocarbons and carbon monoxide. We are chasing no will-o'-the wisp in working upon this interesting and far-reaching problem. What is necessary is to discover the right conditions. If we keep closely to the theory of the galvanic cell, as worked out by Nernst and others, we cannot get far astray, and are likely to reach valuable results in the solution of this greatest of technical problems."

THE French Government officially declares protection to patents or trademarks received by any American exhibitor at the Paris Exposition.

Concentrates.

THE technical name of the tool used by tinners to ut sheet tin is "snips."

AT Battle Mountain, Colorado, the reduction works pay $20 per ounce for the gold contents of the ores.

THE largest stamp mill in British Columbia—40—s believed to be that at the Ymir mine at Ymir.

COLORADO stockbrokers' selling charges on $2 stock nd over are 1%; between $1 and $2, 2%.

THE British-American Co., owning the Le Roi mine, Cossland, B. C., are preparing to sink a vertical shaft to cost 100,000.

A "DOKIMASTIC" test is a metallic assay in which ll the accessories are of a nature to justify absolute accuracy n the result.

ON the long distance telephone wires from San Diego, Cal., into Oregon and Idaho—over 2400 miles—a No. 8 wire is used, about 450 pounds of copper to the single mile.

QUICKSILVER'S highest price in San Francisco was in '74-5—$1.55 per pound; lowest, 33 cents in '79. Its present worth in San Francisco is $42 per flask of 76½ pounds.

THE gold output of the Witwatersrand, South Africa, district, for the year '93 was 1,478,473 ounces; for '94, 1,024,159 ounces; '95, 2,277,635; '96, 2,281,875; '97, 3,034,674; '98, 4,555,009.

THE term "ore shoot" is usually applied to a body of ore. The "ore chute" is an inclined boarded slide built between levels, through which ore is dropped for loading cars run on tracks to the hoisting shaft.

GOLD 750 fine is worth $15.50 per ounce; 800 fine, $16.53 per ounce; 850, $17.57; 875, $18.08; 900, $18.60; 920, $19.01; 930, $19.22; 940, $19.43; 950, $19.63. The San Francisco mint charge for recoinage is $1 per 1000 ounces.

IT is learned, authoritatively, that the only change to be made in the royalty clause of the Yukon regulations will be to raise from $3500 to $5000 the amount of output from each claim to be exempted from the 10% royalty.

IN bessemerizing copper mattes the loss of silver is usually very large, proportionately, and the loss of gold comparatively slight. The three principal losses in pyritic smelters are in slags, flue dust and volatilization.

THE highest point in the United States is Mt. Whitney, San Bernardino Co., Cal. The lowest land in the United States, below sea level, is Death valley in the same county, about fifty miles in an air line from Mt. Whitney.

AS a rule all assays, containing in their charge carbon, puff up because of formation of carbonic oxide, thus requiring the use of a larger crucible, which in such case should not be more than two-thirds filled with the assay sample.

THE present copper "boom" gives the promoter opportunities that are being utilized. A Calumet, Mich., official tells of a Lake Superior copper property that had been lately offered for $10,000, but which is now capitalized at $1,000,000.

A LAW in effect since the 1st inst., requires Westralian gold buyers to pay an annual license of $8.50 and keep a record of all such transactions. Mine owners and managers are obliged by the same law to furnish monthly returns of the gold yield.

THE Michigan Bluff, Cal., question asking how to get rid of a partner that won't pay his share is best answered by reading the California statute on "Partnership for Mining Purposes," which covers the case. The Act was passed April 2nd, '66.

THE relative dissolving powers of different gold solvent solutions is given by some metallurgists as follows: Chlorine, 1% solution, 1¼ hours, 4.49%; bromine, 1% solution, ¼ hours, 6.46%; cyanide, 1% solution, 1¼ hours, 0.57%—60° F. in each case.

UNDER the law the books and accounts of any ore reduction works in the State of Nevada must be exhibited on demand to the Assessor or his deputy. Refusal carries a penalty of fine and imprisonment. The statute, however, is not rigidly enforced.

THE recognized charge for continuous power in large units at the electrical plants now in operation at Niagara Falls is $20 per annum for one electrical H. P. delivered to local plants, or $12 per annum for one dynamic H. P. delivered on water wheel shafts at the power stations.

COMMISSIONER OF PATENTS DUELL furnishes the following statement summing up the report of the Patent Office for the calendar year 1898: "Applications were received from 33,915 patents and 22,207 patents were granted, including designs. Total receipts were $1,137,734."

Meeting notices, assessment notices, delinquent sales notices, dividend notices and all such can be legally published in the MINING AND SCIENTIFIC PRESS. Where obscurity, and not wide publicity, is desired, some other medium, would, however, be probably preferred.

THE term "H. P." has been repeatedly discussed herein. Our Cherry Creek, Arizona, correspondent is right; it is "ridiculous" and should be "obsolete" and will be dead and buried when he and all others agree on the substitution of a term conveying the same idea—and not till then.

A PART OWNER of an unpatented mining claim can get it patented in his name and that of the other part owner or owners, who can not be compelled to give consent or pay, but who can not prevent such issuance. The Government will not issue a patent for an individual or divided interest.

TELLURIUM is not of infrequent occurrence in gold ore in Australia, Colorado and California. In California it is found in Butte, Calaveras and Tuolumne counties. It can be most readily determined by a sulphuric acid test applied to the powdered ore thinly spread upon the surface of a shallow porcelain dish.

THIS paper has only two sources of revenue—subscriptions and advertisements—and the proffer of $100 for "a write-up with a picture of the owner," from a British Columbia mine, is, without prejudice, declined. The facts regarding that mine or any other mine if deemed of general interest would gladly be published as a matter of news, but "write-ups" are not included in the province or purpose of this journal, a fact generally understood and commended.

THE beginning of the work of unwatering the old Comstock levels causes wonder in the minds of many old-timers if the great increase in the price of Comstock stocks will be repeated, eclipsing the recent rise in Michigan copper stocks, as when the 108,000 shares California stock were divided into 540,000 shares, and even then it sold for $250 per share.

SO LONG as men with properties to sell want to get for a prospect the price of a developed property, and men with money to buy want to get a developed property for the price of a prospect, so long will exist the condition of things, commented on at such length by a Montana correspondent. Such conditions are not peculiar to the mining business. They pervade every department of the world's bargains and sales.

LAST WEEK was received a letter from an Arizona subscriber, who had renewed his annual subscription about Jan. 1st, but for whom a Phœnix friend, not knowing that he was already getting it, had subsequently subscribed with instructions to send the paper with "compliments of". Upon receipt of the latter letter, the renewal was returned, but came back with the characteristic reply: "File the Phœnix payment as an extension of the original claim."

AN experienced mill man writes: "Although the subject of the temperature of battery water seems to be about exhausted, permit me to remark that the gold in the ore run by Mr. Louis Blanding, as described by him in the issue of Jan. 7th, was probably so free that it amalgamated without difficulty up to a high percentage with water at ordinary temperature. Had it carried considerable silver or had the ore been but partially oxidized, his test would probably have resulted differently."

THE first U. S. patent issued relative to the cyanide process was to J. H. Rae, No. 61,866, Feb. 5th, '67. The first U. S. patent issued to Messrs. MacArthur and Forrest was No. 403,202, May 14th, '89. Two other U. S. patents were issued to them that year. So far as known the first definite mention of the dissolution of metallic gold in cyanide of potassium was by P. Bagration in '43. Its commercial success dates from the introduction of the MacArthur-Forrest process in South Africa in '90.

THE deposits of Iron Hill, Leadville, Colo., are believed to have been formed by molecular substitution and replacement of the dolomitic limestone by hot alkaline mineral-bearing solutions from below. While agreeing to the replacement theory, S. F. Emmons considers the solution came from above, being heated by the overlying porphyry, as deposit commences from the top of the body, and in the region of greatest ore development there is a noticeable absence of ore channels below, through which ascending solution might come.

SEVERAL correspondents are informed that this office does not furnish any of the publications of the California State Mining Bureau. They are published by the State under the auspices of that institution, are furnished by the State Mineralogist to residents of California, and sent postpaid to non-residents on receipt of a small amount specified on a card issued by the State Mining Bureau, to whom all such requests should be addressed. The State Mineralogist is Mr. A. S. Cooper: his office is in the Union Depot, San Francisco, Cal.

IN sampling silver-lead bar bullion samples taken by chipping out of the top and bottom of each bar usually give a result lower than the actual value of the bullion, due to the fact that that part of the bullion lying against the sides of the mold is the richest in silver, and that none of it is obtained in the chip-sample. If chip-samples are to be taken, it would be fairer to take chips from the top, bottom and side of each bar, these to be taken diagonally across the five bars when stacking. This is condensed from a paper read by G. M. Roberts at the Oct., '98, meeting of the A. I. M. E.

NITRO-GLYCERINE is best let alone. Its chemical composition is oxygen 60.66; nitrogen, 19.91; carbon, 17.06; hydrogen, 2.36. It is made by slowly dropping syrup of glycerine into a mixture of equal volumes of nitric and sulphuric acid contained in a strong vessel surrounded by ice, the mixture being thoroughly agitated after each addition of the glycerine. The nitro-glycerine in oily form is skimmed off and repeatedly washed in pure water, though sometimes dissolved in ether or alcohol and then precipitated with water. It must be kept cold. No amateur not tired of life should meddle with it or its manufacture.

A LOW temperature solder for use when the parts to be soldered will not stand a high temperature is made by mixing finely divided copper (obtained by precipitating a solution of copper sulphate with zinc) is mixed with concentrated sulphuric acid in a porcelain mortar; 30 to 36 parts of copper are taken, according to the degree of hardness required, and 70 parts of mercury are stirred in. When the amalgam has completely formed it is washed with hot water till all traces of acid are removed, and then allowed to cool. When this composition is used, it is heated until it is of the consistency of wax, so that the surfaces to be joined may be readily smeared with it. When cold they firmly adhere.

THE admixture of a mineral oil with any other lubricating oil can be often readily detected by shaking the suspected oil in a bottle until bubbles of air are formed, when, holding the bottle up to the light, the mineral oil, if present, will produce a peculiar iridescence, which is an unmistakable evidence of the adulteration. The presence of "still bottom" impurities is also a proof of the mixture of mineral oil. These consist of fine solid particles of the coating formed on the bottoms of the apparatus in which the fractional distillation of mineral oil takes place. They may be detected, sometimes, by the abnormally low temperature at which the oil vaporizes in contact with them, or by dropping the suspected oil on white blotting paper, which will absorb the oil, leaving the black specks of impurity visible.

APPLICANTS for patent to a placer claim, who are also in possession of a known vein or lode included therein, must state in their application that the placer includes such vein or lode. The published and posted notices must also include such statement. If veins or lodes lying within a placer location are owned by other parties, the fact should be distinctly stated in the application for patent, and in all the notices. But in all cases, whether the lode is claimed or not, it must be surveyed and marked upon the plat, the field notes and plat giving the area of the lode claim or claims and the area of the placer separately. It should be remembered that an application which omits to include an application for a known vein or lode therein must be construed as a conclusive declaration that the applicant has no right of possession to the vein or lode. Where there is no known lode or vein the fact must appear by the affidavit of two or more witnesses.

ELECTROLYTIC analysis can be illustrated in the case of a solution of copper sulphate to be thus analyzed: a measured portion of the solution to be placed in a weighed platinum vessel, connected with the zinc plate terminal of a battery; from the other terminal a wire extending and terminating in a plate of platinum immersed in the solution in the vessel. The passage of the current would decompose the copper sulphate, the copper being eventually deposited in a fine coating on the platinum. Subsequently the metal would be washed with distilled water, and then with alcohol, the dish then dried and weighed with the adherent copper. Subtracting the weight of the dish alone from the weight of the dish and copper would accurately determine the weight of the metallic copper in the solution by "electrolytic analysis."

IN Honman & Vulliez's process for making white lead it is produced by carbonic acid acting on a solution of basic lead acetate. Galena is roasted in a reverberatory furnace having an extra large sole. Above the furnace is fitted a boiler for supplying steam through pipes to the furnace just beyond the bridge. The galena is roasted at a low red heat until most of the sulphur has been expelled. The roasted litharge is placed in a vessel and treated with a hot solution of neutral lead acetate, and is fitted with a pipe for drawing off the basic lead acetate formed. The solution is allowed to settle, and the clear basic acetate solution is led into a tank provided with a steam coil and a perforated worm for supplying carbonic acid gas. The white lead formed is drawn off in a special drying vessel; the residue left in the cylinder, which consists of lead sulphate, is dissolved in caustic soda, caustic potash, or ammonium acetate. The solution obtained is run into a pan and white lead is precipitated by means of sodium, potassium, or ammonium carbonate.

L. VANINO recommends commercial formalin, an aqueous solution of formaldehyde, for the quantitative precipitation of gold and silver from its solutions, and gives the following: 1. For gold, add formalin and a small amount of caustic soda to the auri-chloride solution, heat for about five minutes on the water bath, collect the precipitated gold on a dried and weighed filter and heat the filtrate again with some formalin and caustic soda in order to ascertain that the whole of the gold is precipitated. Wash the gold on the filter with water and alcohol, dry at 180° C., or calcine in a porcelain crucible. 2. For silver, the operations are exactly similar to those for estimation of gold with this difference only, that the silver on the filter must ultimately be washed with absolute alcohol in order to completely remove the water which obstinately adheres to the silver. Vanino has further found that chloride of silver can, by formalin and caustic soda, be quantitatively converted into metallic silver, and he is of opinion that this reaction can be utilized for recovering silver from laboratory residues, and also for the production on a large scale of fine silver from silver chloride. Formalin is a 35% aqueous solution of formaldehyde; its present price in San Francisco is 55 cents per pound.

THE bill introduced last week in Congress by Representative Osborne of Wyoming to establish the Department of Mineralogy and Mining follows the recommendations of the mining congress at Salt Lake City, Utah, last July. It proposes that the department shall be under the supervision and control of an executive officer to be known as the Secretary of Mineralogy and Mines, who shall be appointed by the President by and with the advice and consent of the Senate; *provided*, however, that no person shall be appointed to this position unless he shall have a thorough practical knowledge of mineralogy and mining. Section 158 of the Revised Statutes is amended to include such department and the provisions of title 4 of the Revised Statutes, including all amendments thereto, are made applicable to the new department. An Assistant Secretary is to be appointed also by the President, to perform such duties as may be required by law or prescribed by the Secretary of Mineralogy and Mining. The Secretary shall receive the same salary as is paid to Secretaries of each of the executive departments of the Government, and the salary of the Assistant Secretary shall be the same as that now paid to the First Assistant Secretary of Agriculture. The United States Geological Survey, as at present established, together with all records, maps and apparatus now connected therewith, shall be transferred to and made a part of the Department of Mineralogy and Mining. Mr. Osborne's bill provides that the act shall go into effect and be in force on the 4th day of March next succeeding the day of its final passage.

IN electrolytic assay as applied to refined copper the crawfoot or "gravity" cell is, probably, the cheapest reliable primary battery for a moderate amount of general work, not warranting an expensive plant. That current generator may be made to give satisfaction if it is frequently overhauled—at least twice a month when in constant use, or as often as it becomes choked with deposited material at the bottom. It does not pay to use the zincs up too much; but about half the expense may be saved if a mould is provided, and the zincs are cast with the spent fire at the close of a day's work at the wind furnace. The old zincs may be scraped, broken up, and recast with twice the weight of new spelter. Melt the metal at low heat, and use a covering of charcoal in the graphite crucible. A device, the good effects of which have possibly not occurred to all, consists in refilling the cleaned battery jars one-fourth to one-third full of old battery solution (saturated zinc sulphate) and then diluting with water till the zincs are covered. Pure water, alone, offers a great resistance to an electrical current; and much zinc must be dissolved unnecessarily to establish the proper conditions for maximum current, unless old battery solution is introduced as just recommended, when the cell will be found almost immediately to be in good working order. An excellent current generator is a dynamo with incandescent lamps in circuit, preferably combined with a small plant of storage cells at those laboratories where the current from a dynamo is available only at night. The dynamo current may at that time be caused to run the assays and charge the storage cells for use during the day.

The Bursting of Small Cast Iron Flywheels.

(Continued from Page 117.)

services of the students who carried out the experiments, Messrs. Bishop and French of the class of '97 and the Messrs. Emrich, of the class of '98. Without their intelligent and faithful assistance the work could not have been done. The wheels were all of cast iron and were clean, perfect castings. Two diameters were used, 15 and 24 inches, and each wheel was a scale model of some actual flywheel designed by a reputable firm. The wheels numbered 1 to 10 had solid rims with the exception of No. 5. Wheel No. 11 was a special wheel, as will be explained later. The wheels numbered 12 to 17 had each two joints in the rim and were 24 inches in diameter. All the wheels numbered from 1 to 10 were reduced models of a solid rim flywheel 10 feet in diameter now in use on a 12x30 Allis-Corliss engine in the laboratory. The wheels numbered 12 to 15 were models of the same wheel on a large scale, with rim joints designed by the writer. The two wheels numbered 16 and 17 were models of the flywheel of a Corliss blowing engine. Reference to the various cuts will show the general appearance of the various wheels tested before and after breaking. Tables I and III give the dimensions of the wheels in detail.

To give to the wheels the speed necessary for destruction, use was made of a Dow steam turbine capable of being run at any speed up to 10,000 revolutions per minute. The turbine shaft was connected to the shaft carrying the flywheels by a brass sleeve coupling, loosely pinned to the shaft at each end in such a way as to form a universal joint, and so proportioned as to break or slip without injuring the turbine in case of sudden stoppage of the flywheel shaft. Fig. 1 shows clearly the arrangement of wheel and turbine.

One experiment with a shield made of 2-inch plank (see Fig. 2) convinced us that safety did not lie in that direction, and in succeeding experiments with the 15-inch wheels a bombproof constructed of 6x12-inch white oak was used. The first experiment with a 24-inch showed even this to be a flimsy contrivance, as may be seen by Figs. 3 and 4, from photographs taken immediately after the explosion of wheel No. 11. In all subsequent experiments a shield made of 12x12-inch oak was used, as shown in Fig. 5, which represents the apparatus as employed on wheels Nos. 12 to 17. Even this shield was split repeatedly and had to be reenforced by bolts. The brick piers of the basement furnished havens of refuge for the experimenters and no accidents occurred, but sundry holes in the brick wall, broken hangers, and riddled belting remain as souvenirs of the spiteful force of the flying fragments. The wheels were usually demolished by the explosion, as may be seen from the cuts.

No crashing or rending noise was heard, only one quick, sharp report, like a musket shot.

The determination of the speed offered some difficulties at first, it being too great for the successful use of a counter or tachometer. A commutator of one break was arranged on the flywheel shaft and this connected through the battery circuit with an earphone in an adjoining room. This arrangement worked satisfactorily, giving a clear, musical tone, and the number of vibrations corresponded closely to the speed as measured by a reducing countershaft and speed counter. The commutator and the apparatus used in testing it are shown in Fig. 1. It was soon discovered that the audible tone produced by the machine itself when running at a high speed corresponded exactly to the tone in the earphone, and consequently the earphone was discarded. Two observers, having trained musical ears and provided with tuning forks, had no difficulty in determining the pitch within half a tone, the quarter tones being estimated. The error due to this method did not exceed 5 per cent, and was probably less than if an attempt had been made to get the speed with a tachometer. The bursting speed of the wheels having rim joints was too low to produce a musical tone with any distinctness, and it became necessary to resort to the tachometer. It was not deemed safe for the observers to apply the instrument directly to the flywheel shaft, and a counter-shaft reducing the speed from two to three times was employed. Wooden pulleys were used, connected by a band consisting of several thicknesses of electrical tape. Careful observations convinced the writer that there was no appreciable slip.

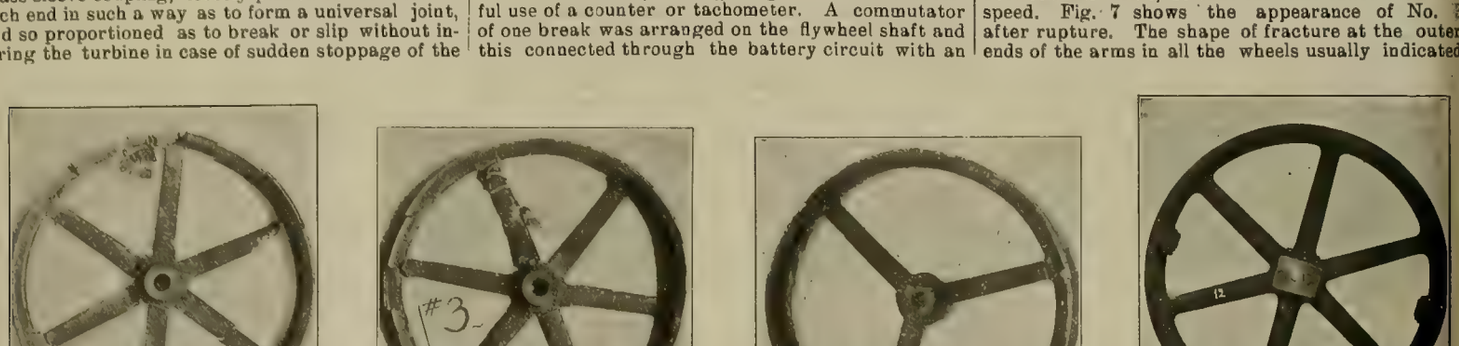
The tachometer used was of the usual rotary pendulum type and was calibrated several times by comparison with a speed counter.

Fifteen-inch Wheels.—Test pieces cast from the same ladle as these wheels were broken in the testing machine, and the following average values obtained for the breaking strength: Tension, 19,000 pounds per square inch. Cross breaking, 39,000 pounds per square inch. The wheels were all turned on the face and edges of the rim, and were carefully balanced by winding copper wire around the arms near the rim.

Wheels Nos. 1 and 2 were practically identical in size and shape, as may be seen by Table I, and broke at the same speed, viz., 6,525 revolutions per minute, or a rim speed of 430 feet per second.

Fig. 6 shows the appearance of No. 2 after rupture.

Nos. 3 and 4 were similar to the preceding, save that the rims were turned down thinner. No. 3 burst at a speed of 6,035 revolutions per minute, or a rim speed of 395 feet per second, and No. 4 at 5,872 revolutions per minute, or 380 feet per second. The rims, being thinner, bent more between the arms, so that the rims failed at a less speed. Fig. 7 shows the appearance of No. 3 after rupture. The shape of fracture at the outer ends of the arms in all the wheels usually indicated that the rim broke first midway between the arms, and that then the parts of the rim flew outward and broke off at the arm.



Wheel No. 5 had two joints in the rim at opposite extremities of a diameter. The strength of the joint was designed to be one-third the tensile strength of the solid rim, but the wheel burst at only 2,925 revolutions per minute with a centrifugal tension of less than one-fourth that of the solid wheels.

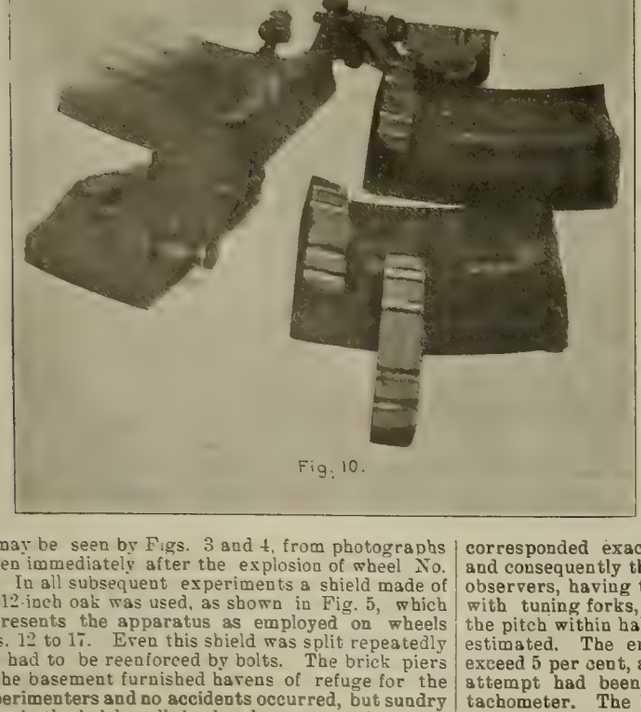


Fig. 10.

Fig. 11.

Nos. 6, 7, and 8 had only three arms, every other arm having been removed from the pattern before casting. The object of this was to show more clearly the bending of rim due to centrifugal force. These three wheels burst at speeds of 5,600 6,18[illegible] and 5,709 revolutions per minute respectively. The figures for No. 6 were obtained with a tachometer and are doubtful, being probably too low. Whee[illegible]

No. 6 is shown in Fig. 8. Wheels Nos. 9 and 10 were of the original six-armed type, but with rims turned down to exceeding thinness, as shown in Table I. They each burst a speed of 5 709 revolutions per minute, or at rim speeds of 365 and 361 feet per second respectively, a reduction of over 5% from Nos. 1 and 2.

TABLE I.—FIFTEEN-INCH WHEELS

No.	Style	RIM Diameter, inches	RIM Breadth, inches	RIM Depth, inches	RIM Area, sq. inches	ARMS Number	ARMS Area, sq. inches	Weight of wheel, pounds
1	Solid	15	2	70	1 4	6	46	20 87
2	"	15	2	65	1 3	6	46	20 44
3	"	15	2	615	1 23	6	46	19 12
4	"	14½	2	52	1 04	6	46	16 62
5	Sectional	15				6	46	20 87
6	Solid	15	2	69	1 38	3	46	19 25
7	"	15	2	615	1 23	3	46	16 56
8	"	14½	2	475	95	3	46	13 68
9	"	14½	1½	400	75	6	46	12 68
10	"	14½	1½	347	65	6	46	13 00

These results are summarized in Table II. An examination of the column containing the values of in feet per second will show that as the segments the rim between the arms become weaker as

joints in the rim, midway between the arms, as shown in Fig. 9. The joints were all carefully planed and the holes drilled to match. The wheels were not turned on the face, but were balanced the same as the others. In none of the experiments was there any shaking or tremor, only a dull roar of increasing intensity, then a single sharp report and quiet, except for the hum of the relieved turbine.

The proportions of the flanges and bolts are given in Table IV. The bolts used were of steel, and samples of each broken in the testing machine gave the results shown in the table.

Wheel No. 12 burst at a speed of less than 1800 revolutions per minute, but the exact speed was not recorded. The flanges broke, as shown in Fig. 10, but the bolts were uninjured, except for a slight stretching.

No. 13 was a duplicate of No. 12 in every way, and burst at 1760 revolutions per minute, or 184 feet per second. Fig. 11 shows the joints after rupture, the bolts uninjured, but the flanges broken through the bolt holes. The flanges of the pattern were then strengthened by adding ¼ inch to the thickness, the bolts remaining the same.

Wheel No. 14 burst at 1875 revolutions per minute with a rim speed of 196 feet per second, in this case the bolts failing, as shown in Fig. 12. This cut is interesting as showing clearly the bending action of the centrifugal force on the bolts, using the inner edge of the flange as a fulcrum. This joint failed first; the wheel then opened like an oyster, fracturing the rim on each side of the joint opposite, the latter joint being left intact.

In No. 15 bolts ⅝ inch in diameter were used, and the wheel failed at 1810 revolutions per minute, or a rim speed of 190 feet per second. In this experiment the flanges of one joint were badly broken, as may be seen from Fig. 13, the bolts remaining whole. The second joint was uninjured, as in No. 14. The broken bolt seen in the cut came from the hub and should not appear. A close inspection of the two bolts in the foreground of the cut shows them to be nearly sheared off at the joint, a phenomenon which is interesting, but which the writer is unable to explain. It would indicate that, as the bolts stretched and the joints loosened, one side of the joint was more affected by the centrifugal force than the other, causing a shearing action in the joint.

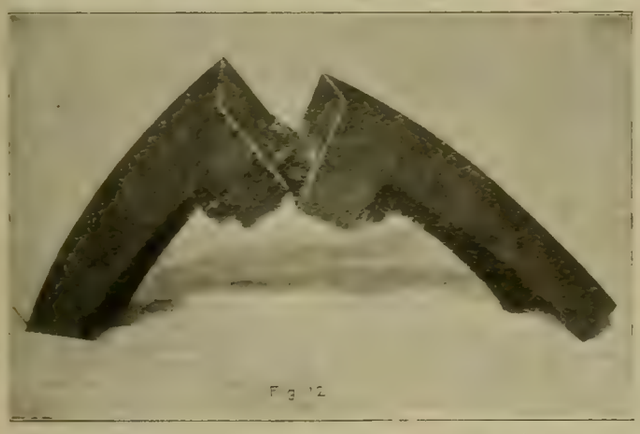

Fig. 12.

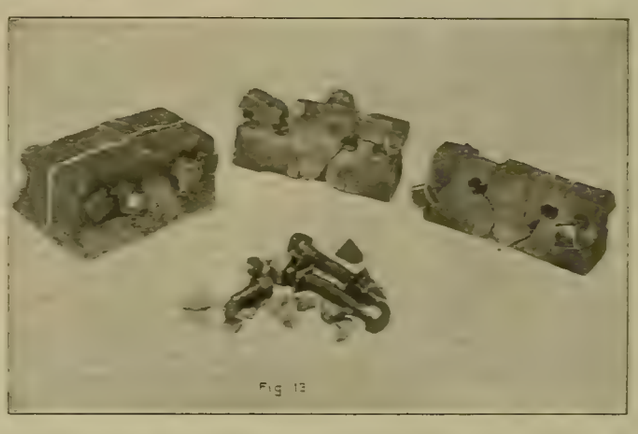

Fig. 13.

ams, either through increase of length or decrease thickness, there is a falling off in the bursting eed.

TABLE II.—FIFTEEN-INCH WHEELS

No.	BURSTING SPEED Revolutions per minute.	Feet per second.	Centrifugal tension $\frac{v^2}{10}$	Remarks.
1	6,525	430	18 500	. . . . .
2	6,525	430	18 500	. . . . .
3	6,035	395	15 600	Thin rim.
4	5 872	380	14.400	Thin rim.
5	2 925	192	3.700	Joint.
6	5,600*	368	13,600	Three arms.
7	6,198	406	16,500	Three arms.
8	5,709	368	13.600	Three arms.
9	5.709	365	13 300	Thin rim.
10	5 709	361	13 000	Thin rim.

*Doubtful.

To determine to what extent the strength is ected by bending, values of $\frac{v^2}{10}$ have been calcu-ted. As has been shown by Mr. Stanwood in the per before referred to, this expression represents proximately the tensile stress on the square inch section of rim, due to the centrifugal force, for st-iron. By comparing these values with the tensile strength of the iron before noted, viz., 19,000 unds per square inch, the amount of stress due to nding may be estimated. This difference varies om 500 pounds per square inch in Nos. 1 and 2 nearly 6000 pounds per square inch in Nos. 9 and —being greatest in the wheels with thin rims or w arms. None of these wheels, however, except o. 5, would have been unsafe at the usual limit for wheel rims of 100 feet per second. Wheel No. 10 ould have had a factor of safety of over 12 at that eed.

Twenty-four-Inch Wheels.—All the wheels numbered om 11 to 17 were of the above diameter. No. 11 as a special wheel which had been in actual use. his wheel burst at 3670 revolutions per minute, or peripheral speed of 385 feet per second, which corsponds well with the average speed of the 15-inch heels. The explosion was very violent and completely wrecked the shield, as shown in Figs. 3 and 4 ne quality of the iron was unknown, save that it ppeared clean and close-grained.

Flanged Joints.—The wheels numbered 12 to 15 ere of the same model as the 15-inch wheels on a rger scale, but each wheel had two internal flange

TABLE III.—TWENTY-FOUR-INCH WHEELS.

No	SHAPE AND SIZE OF RIM. Diameter, inches	Breadth, inches	Depth, inches	Area, sq. inches	Style of joint.	Weight of wheel, pounds.
11	24	2⅛	1.5	3.18	Solid rim	75.25
12	24	4 1/16	.75	3 85	Internal flanges, bolted	92.
13	24	4	.75	3 85	" " "	91.75
14	24	6	.75	3.85	" " "	95.
15	24	4 1/16	.75	3.85	" " "	94.75
16	24	1.2	2.1	2 45	Three lugs and links.	65.1
17	24	1.2	2.1	3.45	Two " " "	65.

TABLE IV.—FLANGES AND BOLTS.

No	FLANGES. Thickness, inches.	Effective breadth, inches.	Effective area, inches.	BOLTS. No. to each joint.	Diameter, inches.	Total tensile strength, pounds.
12	1 1/16 tapering to 1/16	2.8	1.92	4	5/16	16 000
13	1 1/16 tapering to 1/16	2.75	1.89	4	5/16	16 000
14	1 1/16 tapering to 1/16	2.75	2.58	4	5/16	16 000
15	1 1/16 tapering to 1/16	3.5	2.34	4	⅝	20 000

BY TESTING MACHINE

Tensile strength of cast iron = 19,600 pounds per square inch.

Transverse strength of cast iron = 46,600 pounds per square inch.

Tensile strength of 5/16 bolts = 4000 pounds.

Tensile strength of ⅝ bolts = 5000 pounds.

(To be Continued.)

Commodore G. W. Melville.

That the success of the United States navy last summer was largely due to the engineers, is admitted on all sides. That these men are entitled to a higher degree of recognition than was formerly accorded them is equally evident. Prominent in present effort in that direction is Commodore G. W. Melville, Chief Engineer of the U. S. Bureau of Steam Engineering, whose portrait is presented herewith. He and his colleagues have made untiring and intelligent representation of the needs of the navy, and in a measure the success of the Oregon in her famous cruise, subordinate to good construction and able captaincy, is due to his advocacy of the principles which, as supervisor of the designs for her machinery, he was able to put into practical shape.

Commodore Melville is heartily in favor of large boiler power and great speed. In an article in the current number of *Cassier's* he shows that speed of ship is a vital factor in marine engeering, for the greatest improvements in design and manufacture have resulted from the demands for higher speeds, and goes on to say that twenty-five years ago the highest sea speeds for merchant steamers were less than 16 knots, and for war vessels were even less, except in such notable cases as the cruiser Wampanoag of the United States navy. In the merchant service the increase of speed has been gradual since the advent of the Arizona with 17 knots, every few years at least bringing out one or more faster greyhounds, until we have the Kaiser Wilhelm de Grosse, with a record of 564 knots for a day's steaming and an average for that day of 22 83 knots. He cites other notable instances of increase of speed, which he shows has been made possible by the improved economy of the machinery and the reduction of weight per unit of power. Commodore Melville's latest achievement and contribution to the efficiency of the navy is the repair ship Vulcan, the floating machine ship which was of such instant and material aid in Cuban waters last summer, and which this journal illustrated and described in its issue of Oct. 1st, '98.

COMMODORE G. W. MELVILLE.

Minting Gold and Silver.

The precious metals are never found in the pure state, and are deposited at the mint alloyed with other metals, and in a great variety of forms, such as native grains, dust, amalgam, bars or pigs, old jewelry, etc. The mixed metals are known under the generic name of bullion. This is first weighed in the deposit weigh room, taken to the deposit melting room, put in a crucible previously heated in the melting furnace and covered with a thin coating of borax, which forms a sort of fluid glass, acting as a cover to protect the metal, when it is molten, from the oxidizing influence of the air. A workman, wearing a pair of large canvas mitts, somewhat resembling boxing gloves, grasps with a pair of iron tongs a rod of plumbago, thoroughly stirs the fluid mass, and the metal is then cast into an iron mold called a shoe. It is plunged into water to cool, as well as to dissolve off any particles of the borax glass which may have adhered to its surface. It is now returned to the weigh room and reweighed. A slight loss in weight usually occurs, owing to a partial refining out of the base metals, and the new weight is the amount with which the depositor is credited. After the metal has been returned from the melting room, where it was cast into the shoe mold, and the bar reweighed, a small chip is cut off from one end of the bar and taken to the assay laboratory. The sample is rolled into a thin ribbon and stamped with the number of the deposit which it represents; it is then assayed to determine the proportion of gold, silver and base metal, and so accurate are the processes of assay that the exact value of a deposit, frequently aggregating many thousands of dollars in value, is determined to a fraction of a cent by calculations based on the assayer's report.

The largest weight which the assayer uses in making an analysis of gold bullion is the French half gram (about 7¾ grains troy).

The balances used in this work are so sensitive that a weight of one-twentieth of a milligram (less than one-thousandth part of a single grain) will cause the indicator needle to deflect a very appreciable distance from the zero point on the graduated scale marking the equilibrium. These little balances are inclosed in glass cases, provided with sliding windows to exclude any draught of air. The beam is usually made of aluminum, one of the lightest metals, and the knife edges rest on jewels. The weights are made of gold, silver and aluminum and are graduated from the half gram, which is arbitrarily denominated 1000, down to the ten thousandth degree.

The assayer first determines approximately the relative proportions of the metals existing in the alloy, and from this bases his more careful determinations; he weighs out on the balance exactly one-half gram, or 1000 parts of the alloy; he wraps this in an envelope of pure lead and rolls it into the form of a bullet. The bullet is then placed in a small cupel, made of calcined bone dust, which has been brought to a white heat in the muffle or oven of the assay furnace.

The mass melts immediately, and the lead oxidizes rapidly by absorbing oxygen from the heated air which passes continually over its surface, and on account of the extreme fluidity of the oxide it sinks into the pores of the cupel, which absorbs it as readily as a sponge absorbs water; the lead also carries with it all the base metals which may be originally combined in the alloy, but the precious metals, not being oxidizable, simply melt, and are not so fluid as to be capable of sinking into the cupel. A separation thus takes place, and at the moment when all the base metal is removed a flash is observed on the surface of the metal; the button of purified gold and silver resulting from this operation is then removed from the cupel, returned to the balance, and weighed; the loss indicates the proportion of base metal. Another weighing of the same sample is then made, to which is added pure silver in the form of fine granules, in the proportion of about two parts of silver to one of gold, the alloy is enclosed in a sheet of lead and cupelled as before; the silver button remaining is laminated, coiled into a roll called a cornet, and boiled in nitric acid. The acid dissolves the silver, leaving a little roll of nearly pure gold.* This gold cornet is then annealed in the furnace to give it toughness, and is finally weighed; this weight represents the proportion of pure gold. The proportion of silver is ascertained by subtracting the weight of the pure gold plus the weight of the base metal from the original weight of the assay sample.

Silver was formerly assayed in the same way, but it was long known that the result was not quite accurate, owing to a partial volatilization of the metal when exposed to the high temperature of the fire. Experiments were instituted by the French Government to overcome this difficulty, which resulted in the "humid process" devised by Gay-Lussac. This is one of the most accurate methods known to chemical science, and so complete was Gay-Lussac's original description that little room has been left for any improvements, and many thousands of dollars' worth of silver bullion are rapidly and accurately determined every day in the Mint in this way. The rationale of Gay-Lussac's method is very simple, viz.: a given amount of chlorine will precipitate a definite proportion of pure silver from its solution in nitric acid.

The assayer prepares two solutions of common salt water; one is known as the normal solution and the other as the decimal solution. One begins and the other finishes the assay.

The sample of silver to be assayed is weighed out, as in the case of gold, the assayer taking care to place a sufficient weight of the alloy in the scale pan to contain at least one gram (a little over fifteen grains) of pure silver; the weighed sample is then placed in a glass bottle and a charge of nitric acid is added to it; the acid is caused to boil, and in a short time the silver alloy is completely dissolved.

A charge of the normal salt solution is then allowed to flow into the bottle from a glass pipette, made of such a capacity that it shall contain just enough salt water to precipitate one gram of pure silver; the chlorine in the salt water combining instantly with the silver, precipitates it in the form of a white cloud; the bottle is then agitated rapidly for a few moments, when the precipitate settles to the bottom, leaving a clear solution above; the assayer next allows a charge of the decimal solution, which is one-tenth the strength of the normal solution, to flow into the bottle from a burette or glass tube with graduated divisions, each division marking one-hundredth the capacity of the large pipette. If any silver remains in the solution a cloud will be observed on the surface. As this decimal charge is one-tenth the strength and one-hundredth the volume of the large pipette, it will precipitate just one-thousandth as much silver, or one milligram. The bottle is again agitated to settle the precipitate, and successive charges of the decimal solution are added until all the silver is precipitated, and then a simple rule-of-three sum gives the exact proportion of pure silver contained in the original weight of the alloy. The assayer guards against all probable sources of error by an elaborate system of checks, and each set of assays is accompanied in all its mutations by one or more proofs or synthetic assays, made either from pure metal or from alloys of known composition.

After the exact proportions of gold, silver and base metal constituting the alloy have been reported by the assayer to the superintendent, the value of the deposit is calculated, and the depositor is paid the full equivalent, less the charges for refining, the amount of charges depending, of course, upon the nature of the bullion.

The metal now passes into the hands of the melter and refiner.

Suppose that the representative deposit contains a small percentage of base metals, such as tin and lead, which tend to make the alloy brittle or short, rendering it unfit for coin. The first operation is intended to eliminate these impurities, and is called toughening. The metal is melted in a crucible and an oxidizing flux (saltpeter) is added to it while fluid; the saltpeter or niter decomposes and liberates oxygen gas; the oxygen seizes the base metals forming oxides; these rise to the surface and are dissolved in the flux; the flux, when sufficiently thick, is skimmed off, and the purified metal, consisting only of gold and silver, is poured into cold water to form granulations.

(To be Continued.)

*A faint trace of silver remains undissolved by the acid, called the sur-charge. The amount is ascertained by proof assays, using gold 1.00 fine, and proper allowance is made for the sur-charge of silver.

An Official Ruling.

The following is from the general commissioner of the land office:

"I am in receipt of your letter of Dec. 15, 1898. Under the United States placer mining laws one person may make a single location containing twenty acres of placer mining land, two persons may make a single location containing not more than forty acres in a compact body, three may locate sixty acres, etc., but no single location, whether made by eight persons or more, can exceed 160 acres.

"It has been decided that a single location of placer mining ground may embrace 20, 40, 60, 80, 100, 120, 140 or 160 acres in a compact body, according to the number of locations.

"If eight persons should make eight distinct and separate locations of twenty acres each, and seven of the locators should convey their claims to the other, it would require annual assessment work of the value of $800 to maintain the possessory right to all of the claims; but, in the case of a single location, embracing 160 acres of placer mining land, the owner thereof, in order to maintain his possessory right thereto, would not be required to expend $100 worth of mining labor on each twenty acres thereof, but his possessory right to the entire 160 acres might be maintained by performing thereon $100 worth of actual mining work designed in good faith for the improvement of the 160-acre location as a single mining claim."

At Niagara Falls is a paper factory which consumes 150 cords of soft wood a day, which is converted into 120 tons of print paper inside of twelve hours. The wood is chipped or ground and then treated with sulphuric acid and lime, a white pulp resulting. There is then added a certain proportion of rosin and clay, the whole being boiled some seven or eight hours, when it is run off in the usual way, on endless blankets, between steel, steam-heated rollers, and wound ready for perfecting presses. Such paper sells for about 3 cents a pound, and is used in the offices of daily newspapers. It contains no "rag," and soon grows yellow. The paper on which this is printed costs more than twice as much, and is enduring.

The Standard Oil Copper Trust.

It is believed that the name of the new copper combination upon which H. H. Rogers of the Standard Oil Co. and Mr. A. C. Burrage of the Arcadian Copper Mining Co. are at work will be the American Copper Co. and that it will be incorporated in New Jersey, but still nothing has been absolutely settled, and it may be many weeks, if not months or years, before the combination takes fixed form.

One thing, however, we are assured of and that is that a paper capital of $500,000,000 is contemplated, and that there will be very many millions of shares and a low market price in order that the public may not appear to be far from the ground—floor.

It is believed that Mr. A. C. Burrage will take the place of Mr. Lewisohn as the leading copper selling agent in the United States, and it is declared that this will be one of the main economies and that in the aggregate the economies whether reached in reduced railroad rates, reduced miners' wages or reduced selling agents' commission will in the aggregate amount to $6,000,000 per annum, and that this can be capitalized for $100,000,000. A large measure of this $100,000,000 will of course be absorbed by the present owners of the Butte & Boston and the Aracadian copper mines. It is not believed that either of these companies can produce any considerable amount of copper, but they make excellent speculative counters, and into them values can be made to flow through a consolidation scheme.

It is declared that the Calumet & Hecla would be worth more than fifty millions in such a combination for its name alone, but it is not believed that it can be had for any such purpose. Some people who have studied the situation believe that it may take five years to perfect the control of the world's copper market through copper mine ownership, and others who have studied in situation believe the ultimate result will be a low copper market.

Still others believe that the Standard Oil alone does not possess money enough, even if its twenty-five multi-millionaires convert their $400,000,000 of security values into cash to control the copper of the world, either its production, its use or its price.

Nevertheless, from intimations we have from Standard Oil sources, it does appear as though Mr. H. H. Rogers of the Standard Oil Co. was, in conjunction with the millions controlled by his Standard Oil associates, about to take upon his shoulder the task of Sisyphus, to wit: The capitalization of the output of American copper mines at $1 per pound of copper.

In other words, a corporation is to be formed with $500,000,000 capital to represent the production of 500,000,000 pounds of copper per annum, allowing that all the great copper mines in the United States, including Calumet & Hecla and Anaconda, can be embraced in the combination.

The actual cash prices predicted by the Standard Oil men in this combination for the leading copper shares, and prices reasonably in sight if the copper movement continues for three months more as three months in the past, mean nothing less than $500,000,000 of actual market value for this Standard Oil copper trust.

To pay 6% upon this valuation means nothing less than 6c per pound profit upon every pound of copper mined.

The average selling price of copper the last ten years has been under 12c per pound.

Is it reasonable to suppose that a $500,000,000 copper trust can long stand on such a basis?

Let the public "Watch Butte," and, above all, let the New England copper share investor watch the tides of the times! These figures are not set down for the day or the hour, but for remembrance.

There have been combinations of capital before representing as much as $500,000,000, but they have never yet been found invincible because of their size.

The late Calvin S. Brice said: "I do not know of any men who have lost more money in railroad investments than Standard Oil men."

It is well known that they have been the largest sufferers in Missouri, Kansas & Texas, Atchison, Chicago & Northern Pacific, etc. But this should be said to their credit; they have stuck to their own investments whether good or bad and have not been manufacturers of securities for purposes of sale to the public.

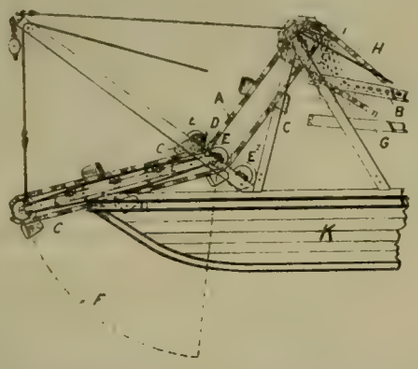
They have been organizers of industry and creators of values and their investment errors have been outside of oil and the products of oil.—Boston News Bureau, Jan. 28.

Latest Mining and Metallurgical Patents.

Patents Issued January 24, 1899.

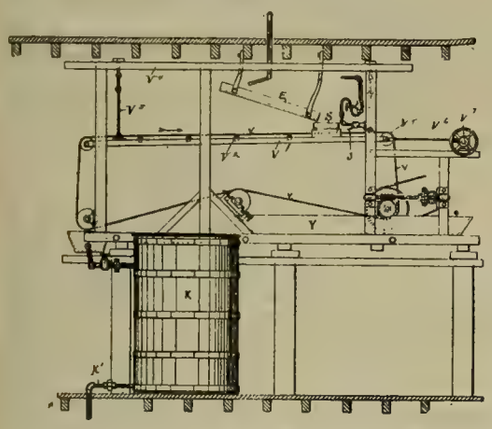
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

DREDGING MACHINE.—No. 618,143; A. Thompson, Tacoma, Wash.



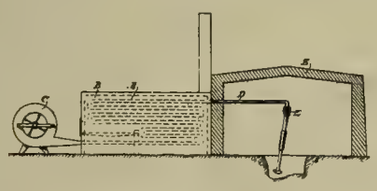
A combination of a pivoted boom or carrier and a sprocket chain thereon of idler pulleys located at or near the pivot of the boom, keeping the tension of the chain constant in any position of the boom, the upper pulley being located upon separate shafts, leaving a clear space between them.

CONVERTING METALLIC LEAD INTO OXIDES.—No. 618,213; A. W. Southard, Newark, N. J.



Agitating in a suitable vessel metallic lead in a comminuted form in the presence of water, and simultaneously introducing air into and throughout the mass; withdrawing a portion of the mass and agitating it to separate the lighter hydroxid from the heavier metallic lead by gravity, and compressing the hydroxid for expelling the water therefrom.

FOR WORKING FROZEN AURIFEROUS EARTH.—No. 618,266; B. F. Gilman, San Francisco, Cal.



For thawing frozen earth or gravel in place, by applying heat directly to the surface and maintaining it in contact therewith, by means of a furnace, an air-forcing mechanism, a substantially tight working inclosure for the operators, the inclosure surrounding the surface to be thawed, a pipe leading from the furnace into the inclosure for conducting the heat thereto, a jet pipe within the inclosure having a horizontal series of jets or discharge passages and a flexible joint within the inclosure, connecting the conveying pipe with the movable jet pipe.

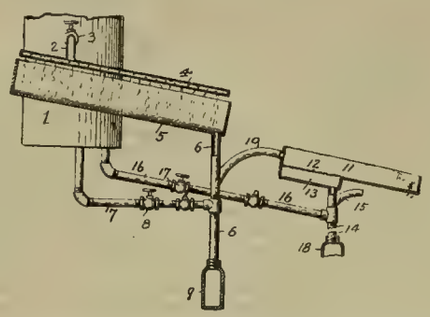
MANUFACTURE OF WELDED PIPE.—No. 618,327; T. J. Bray, Pittsburg, Pa.

Forming welded pipe, preparing skelp by bending the lateral edges to obtain a trough-shaped skelp having an extended flat center of a width substantially half the width of the skelp and raised curved edges, introducing the same into a suitable heating furnace with the flat body portion of the skelp resting upon the furnace bottom and the lateral curved edges projecting above bottom, raising the edges of the skelp to a welding heat and the body of the skelp to a bending heat, and finally passing skelp from the furnace into and through a suitable contiguous welding device.

MINERS' PICK.—No. 618,377; E. Daly, Monterey, Cal.

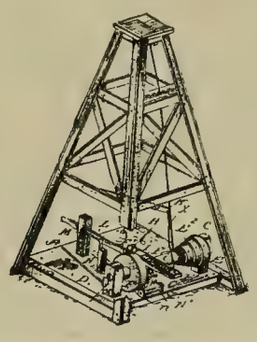
A combination with pick head having a slot in the end, a detachable point having a tongue to fit the slot, an overhanging top flange and an excess of metal on the lower edge of the tongue for swaging the tongue over the edges of the slot and the cushion interposed between the heel of the tongue and the back of the slot.

GOLD SEPARATOR.—No. 618,270; F. E. Jackson and L. R. Henley, Greentown, Ind.



A concentrating machine, in which is combined an elevated water tank, inclined sluice-box, perforated pipe located above the sluice-box and extending from end to end thereof and connected with the tank, a vertical pipe connected with the lower end of the sluice-box having a sight receptacle at the lower end and provided intermediate its ends with a pipe leading to the tank, the curved pipe connected with the vertical pipe above the connection of the pipe leading to the tank, the inclined trough having a box connected with its upper end provided with a screen flush with the bottom of the trough, the trough provided with a vertical pipe connected with the tank and having a curved discharge pipe above connection and with a sight receptacle at the lower end.

OIL WELL DERRICK.—No. 618,297; F. R. Shaw, Chatham Center, Ohio.

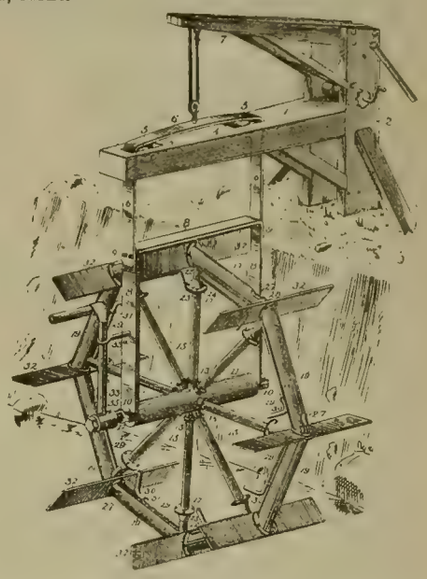


In a lifting device of the character delineated, a shaft *D* journaled in suitable bearings having rigid thereon a cone pulley, a brake wheel *F*, a brake band *F'* adapted to engage therewith, a lever for operating brake band; a tooth wheel having forwardly curved teeth, a pawl *N'* rigidly secured to the lever *N*, pivoted to a suitable base and adapted to engage the teeth of wheel to hold the drum in lock position and a lever *O* adapted to engage the lever *N* to hold the pawl out of engagement with the wheel, in combination with a suitable derrick having a rope supporting and carrying means therein, a rope adapted to be secured to and wound upon pulley and a guide piece in derrick adapted to guide and hold the rope on the proper step of pulley.

ELECTROLYTIC REFINING OF COPPER.—No. 617,886; E. A. Smith, Anaconda, Mont.

An electrolytic method of refining copper consisting in depositing the copper from anodes immersed in an acid bath, concentrating the resultant impure electrolyte to recover by crystallization the bulk of the copper salts (blue vitriol), further treating the "mother liquor" by progressive shallow evaporation at high temperature, under air exposure, to throw down the iron salts and to gradually concentrate the free acid, and upon subsequent cooling then adding suitable hyposulphite to remove the antimony and arsenic while retaining liberated sulphurous acid in solution, and thereupon diluting to complete the precipitation of antimony and arsenic prior to the return of the free acid to the refinery bath.

CURRENT WHEEL.—No. 618,148; T. J. Vance, Rosebud, Mont.



A current wheel comprising a suitable carrying frame provided with journal bearings, a tubular wheel shaft having a hollow trunnion or journal, a series of hollow-valved spokes communicating with the wheel shaft, a series of hollow-valved rim sections communicating separately with the spokes, a series of paddles clamped between the rim sections, a discharge pipe supported on the frame and a coupling united to the pipe and the tubular journal of the shaft.

Patent Office Requirements.

The Patent Office is divided into divisions to each of which is allotted several classes of inventions, the entire system covering every art and science known to the world. These divisions are each in charge of a principal examiner and a crops of assistants, whose duty it is to examine carefully the applications for patents that have been filed with the Patent Office.

The rules of the Patent Office require that every application shall consist of a petition directed to the Commissioner of Patents, praying for the grant of a patent upon the alleged new and useful invention or improvement thereof, and a full description or specification, setting forth in detail the invention and advantages possessed over similar devices known to the art. The specification must be summed up by one or more claims, pointing out particularly that part of the invention claimed as new and for which the inventor seeks protection. An oath is also required, which is to the effect that the person or persons making the application believe themselves to be the original and first inventors of the invention described and claimed, and stating whether or not the invention has been in use for more than two years, which would bar the grant of a patent, and also stating in what foreign countries, if any, the invention has been previously patented.

The application papers must also, when possible, be accompanied by a drawing showing the invention in detail. All of these papers should be prepared with the greatest care, and it is here that the skill of the solicitor is required. The rules and statutes governing the grant of patents makes it necessary that the application and claims shall be prepared absolutely in accordance therewith and what might sometimes appear to be a slight error or omission, might result in having the patent declared void. The claims should be drawn with a full knowledge of the prior state of the art, and a failure to set out all those parts of the invention which properly belong to the inventor would mean a forfeiture of a part of it to the public for which the inventor would receive no return. The drawings must be prepared by a skilled draftsman in accordance with the rules and requirements of the office. These are generally made from a model or sketches of the invention furnished the attorney by the inventor. No pains should be expended in the preparation of an application as the case should be presented to the Patent Office in the best form possible.

The Genesis of Petroleum and Asphaltum in California.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER.

It can be tentatively stated that fossil bitumens are principally derived from terrestrial and marine vegetation, which were deposited in sedimentary strata, then changed to carbonaceous matter, and afterwards distilled by the heat of metamorphism.

In other words, the bitumens are Nature's coal oils and tars distilled in Nature's still, generally with infinite slowness when compared with a modern tar still or retort.

Although some of the hydrocarbons can be produced synthetically in the laboratory, still it is to be believed that nearly all, if not all, of the accumulations of fossil hydrocarbons owe their existence to the vital principle, that they are derived directly or indirectly from organized beings—animal or vegetable, probably the latter, for reasons given hereafter.

In the decomposition of vegetable tissue, when air is wholly or partially excluded from it, as, for example, when buried in the ground, the constituent elements of the vegetable tissue rearrange themselves mutually into new products either with or without the co-operation of the elements of water, the oxygen gradually uniting with the carbon to form carbonic acid, which separates and leaves as a residue substances rich in carbon and hydrogen. It is in this way that bituminous coal, peat and brown coal (lignite) have been formed from vegetable matter.

With carbonaceous material in the same deposit, the same series of strata or in the same stratum, there are differences of composition. The varieties of carbonaceous materials may have been produced from different kinds of plant form, from which coal has been derived, and the peculiar conditions of the districts where the plants flourished, before their downfall and inhumation or submersion. The changes that have taken place in the original plants during their passage from woody fiber into coal are ascribed to evolution of a part of their hydrogen and oxygen, as there are less of these elements in coal than in wood. This will be observed by viewing the following table:

Organic.	*Format'on.*	*C.*	*H.*	*O.*
Wood	Recent	52.65	5.25	42.10
Peat	Recent	60.44	5 96	33 60
Lignite.	Cretaceous and Tertiary..	66.96	5.27	27.76
Brown coal.	Cretaceous and Tertiary..	74.20	5.89	19.90
Coal	Secondary	76.18	5.64	18.07
Coal	Older	90.50	5.05	4 40
Anthracite.	Crystalline	92.85	3.96	3.19
Graphite	Crystalline and Archæan..	100.00		

There is no strict line of demarcation between the above-named organic matter; the one below gradually merges into the one above.

The older the formation, the greater the amount of carbon contained in the coal, the amount of hydrogen and oxygen having been diminished. This fact may be ascribed chiefly or in part to the degree of heat and pressure to which the lower and older coal strata have been and still are subjected.

Graphitic and anthracitic varieties of coal are metamorphic coal produced by heat, the volatile matter being vaporized, which probably afterwards condensed in fissures and porous rock above, as bitumen, petroleum, etc.

Graphite occurs in the Archæan, but none of the other coals are found in these rocks, neither is bitumen or petroleum oil found in the Archæan formation, but they are found in all the other formations lying above the Archæan. From this it would seem that the bitumens originated in or above the Laurentian rocks, and not below them. The absence of the bitumens and petroleum in the Archæan formation is evidence against the theory that petroleums are produced by the action of water upon red-hot carbonized iron in the interior of the earth. It is at least conclusive evidence that this process is not at present in operation.

Graphite is in all probability the ultimate stage in the series of changes which vegetable matter undergoes passing through the conditions of heat, lignite and mineral coal to end in graphite. Several modifications of graphite may be produced artificially. When cast iron is melted with an excess of charcoal it dissolves a portion of the carbon. This carbon, when the iron is allowed to cool, slowly crystallizes out in the form of large and beautiful leaflets of graphite.

Anthracitic varieties of coal are associated with folded and metamorphic rocks. Anthracitic condition of coal may sometimes be traced to local effect of igneous rocks. As rocks grow less and less metamorphic, the more bituminous is the coal contained in them.

Graphite is disseminated in strings, veins and beds through hundreds of feet of the Lower Laurentian strata, and its amount is calculated to be equal in quantity to the coal seams of an equal area of the Carboniferous rocks.

In central Scotland, where the coal fields have been so abundantly pierced by igneous masses, petroleum and asphaltum are of frequent occurrence, sometimes in chinks and veins of sandstone and other sedimentary strata, sometimes in the cavities of the igneous rocks themselves. In West Lothian intrusive sheets traversing a group of strata containing seams of coal and oil shale have a distinct bituminous odor when freshly broken, and little globules of petroleum may be detected in their cavities. In the same district the joints and fissures of a massive sandstone are filled with solid, brown asphalt, which the quarrymen manufacture into candles.

Graphite has probably the same vegetable origin as mineral coal. It is now generally conceded to be of organic origin, the result of metamorphism of some of the products of destructive distillation of vegetable tissues. In general arrangement and microscopic structure the layers of graphite correspond frequently with coal and some bituminous deposits.

The majority of coal mines in California are in the Cretaceous rocks of the Lower Tertiary. The rocks underlying the Tertiary formation and the lower parts of the Tertiary formation are in many instances metamorphic, the Cretaceous and Tertiary rocks having been changed to metamorphic rock by hydrothermal action, and, if they contained carbonaceous material, petroleum was distilled, which ascended in a vaporous condition and was condensed in the unaltered rocks. After condensation, it was carried upwards by gas and hydrostatic pressure and in some instances by rock pressure.

The presence of nitrogen in the California petroleum oils has been adduced as a proof that they are of animal origin; this proof is not conclusive, as most all of the coals and carbonaceous shales yield nitrogeneous products when subjected to destructive distillation. As a proof of the animal origin of petroleum, it has been stated that pools of petroleum have been found which were filled with live maggots.

Many hundreds of pools of petroleum in California have been examined without discovering any maggots or other forms of life in them, although there have been swarms of flies and other insect life in their neighborhood. In the vicinity of pools of petroleum female flies quickly discover and lay their eggs on spoiled or moist food stuffs, meat, decaying meat, meat broths, dead animals, in manure heaps, etc. Taking into consideration the persistency of female flies to deposit their eggs upon anything capable of sustaining the life of their young, it is to be believed that all pools of petroleum would be filled with maggots if flies were present and petroleum was a suitable food for their larvæ.

Maggots feed upon animal and vegetable tissues and liquids, and not upon their fats and oils.

When animal hydrocarbons are deprived of all animal tissues and liquids, they are not molested by flies. Petroleum is also found to be an excellent maggot killer.

There are only four ways of preserving animal remains from decay and putrification: First.—In a case from which the air has been completely removed and excluded. Second.—By antiseptic agents. Third.—Subjected to a heat exceeding 100° C. Fourth.—Subjected to a cold under 0° C.

To secure and preserve any quantity of animal remains by any of these four ways cataclysms of nature must occur. Geology does not show that any large quantity of animals have been inhumed in the earth by cataclysms; even provided animals were buried in this manner, there is sufficient oxygen present to start decay, and, after this has commenced, putrefication ensues.

The ordinary rate at which sedimentary rocks are deposited is too slow to effect the inhumation of animal substances so that they will be excluded from the air and preserved.

But few animal remains are found encased in ice, and these are not buried beneath the earth; there is no other way in which they can be preserved by cold.

There is no way in nature that animal remains can be maintained at a temperature of 100° C. from the time of their death until changed to bitumen.

Very seldom are animal remains preserved by antiseptics in nature, and, if so preserved, their aggregate amount is small. All the ways that can be employed to preserve animal substances are destructive to animal life. The presence of life and the conditions and way necessary for the preservation of animal substances cannot exist in the same place at the same time.

In order that petroleum oil may be derived from animal remains, it is first necessary that such remains be placed and preserved in a condition for such change.

In the present age the inevitable end of animal after life is to furnish nutriment to the scavengers of the earth and sea or their decomposition by putrefication.

There is no reason why that in former ages this was not the ultimate fate of animals.

The products of the decomposition of nitrogenized animal substances are as follows: The oxygen of the substance unites with the carbon to form carbonic acid, while the hydrogen divides itself between the nitrogen, the sulphur and the phosphorous and form ammonia with sulphuretted and phosphoretted hydrogen.

The surroundings would indicate that the fossils in the petroliferous formations of California lived and died and were embedded in the same manner as the mollusca of the present day; in fact, a large number of the fossils in these formations are the prototypes of existing mollusca and must have lived and died in the same manner. There is nothing showing that after death the mollusca existing at the present day are preserved for the future manufacture of petroleum. This is also true of the infusoria.

The fossil animals do not show any stage of transition between animal matter and petroleum oil.

Large quantities of fossil shells exist in the shales and sandstones of California; these are usually filled with silt or the shells have been changed to silica and the interior filled with silica, or molds and casts exist, the carbonate of lime having been leached away. They only contain bitumen when the interspaces and cracks in the adjoining rocks are filled with bitumen. There is no carbon in these fossils, except in some instances the carbonate of lime constituting their shells. There is no carbonaceous matter from which bitumens could be derived by any known process. There are no more fossils in the rocks which are impregnated with bitumen than those which are destitute of bitumen.

Bitumens are found in the unaltered sedimentary rocks of California sandstones, shales, limestones, etc. There is no bitumen in the metamorphic rocks. The only substances originally contained in these rocks that could and can be converted to bitumen is organic vegetable remains in the form of coal, lignite and carbonaceous shales. These carbonaceous substances are not changed to bituminous unless distilled by heat.

Most all of the known beds of coal, lignite and carbonaceous shale belong to the Cretaceous or Tertiary formations.

If bitumens exist in them at all, the surrounding and accompanying phenomena show that these accumulations of bitumen are secondary.

A primary deposit of petroleum is in the rocks in which it was formed.

A secondary deposit is where it has migrated from the rocks in which it was formed and accumulated in other rocks.

If petroleum is produced by destructive distillation it cannot remain in the rocks in which it formed.

(*To be Continued.*)

The California Water Wheel.

TO THE EDITOR:—Recently, in looking through a text book upon hydraulics, which has passed through several editions—which indicates that it has been extensively introduced—I noticed that the California jet water wheel is classed as an impulse wheel, and pronounced as being exactly similar in its action to an undershot wheel. To endeavor to establish this wheel—which is wholly of California origin—in the true and meritorious position to which it belongs, to prevent it from a foundling's fate, and perchance prevent other authors or educators from compiling or continuing this error, is my object in writing.

The two wheels—the undershot and California—utilize the force of gravity, and there the similarity ceases.

With the undershot wheel, the water moving upon an inclined plane makes impulsive contact with the buckets and pushes them along, utilizing a portion of its required velocity and a portion of its fall.

The California wheel—by which I refer to the class, and no individual member—receives its water as a jet, with velocities ranging from 40 feet to nearly 400 feet per second, dependent upon height of head. The range of velocity given being as already applied, the principle of its action is such that, to obtain great efficiency, the buckets should recede from the jet with a little less than half its velocity, just enough less that the water shall be turned back back upon itself, or its course in the bucket, but not enough to cause it to jet back. In action the buckets receive a blow equal to one-half of jet velocity, and were that the termination of action we could realize but one-half the jet force, the other half passing on with the buckets and beyond the wheel as velocity. Instead, through the differences of velocities above noted, all the energy of projection is struck from the jet, and, following a gravity impulse, it falls vertically.

There are many manufactures of wheels embodying this principle of action, many of which not showing high efficiency, but there are enough good ones as that no purchaser should accept a guarantee of less than 80% by actual honest test. The very best ones test as high as 90%, which is a remarkably good showing.

This California impact wheel, I will so name it, is purely of California origin, and, comparatively, a new device, having been brought into existence since the days of '49. Its first embodiment as a principle was very crude and unpretentious, but upon it has been a continuous improvement to the present time; some of the better forms of recent designs transmitting nearly all the applied force that can possibly be obtained for service.

Along this highway of improvement are strewn many devices which show no vitality, and many others representing all degrees of vitality, which, for the benefit of users of wheels, should be devitalized, but, as a recompense for all this effort, there has been developed and perfected upon new lines a wheel of highest efficiency. CALIFORNIA MINER.

The Copper Deposits of the "Seven Devils," Idaho.

Written for the MINING AND SCIENTIFIC PRESS by WALDEMAR LINDGREN.

Introduction. — Between Weiser on the Oregon Short Line and Lewiston, both in Idaho, the Snake river passes through a continuous canyon, in depth and grandeur equalled by the few in the United States. The distance between the two points is in a straight line about 170 miles. In the deepest part of this canyon the Salmon river joins the Snake, and, above the junction, the two rivers for forty or fifty miles flow nearly parallel, separated only by an extremely abrupt and rocky ridge. Somewhat farther south this ridge culminates in a group of sharp peaks, to which the name of Seven Devils is given. Rising on the eastern, Idaho, side of the river they attain an elevation of about 10,000 feet above sea level or 8000 feet above the bottom of the canyon only a few miles distant. They overlook the monotonous lava plateaus southward, and westward, across the canyon, the same lava flows extend to the foot of the Eagle Creek range, Oregon.

A few miles south of the Seven Devils, nearly on the brink of the canyon, are situated the copper prospects which lately have attracted so much attention. The nearest point on the railroad is Weiser, seventy-five miles distant. A good road with easy grades leads from Weiser via Salubria and Council valley to the copper camp. The elevation at the mines is about 6500 feet.

Mining Operations.—During the first excitement in the eighties many locations were made and a little town of log cabins called Helena was built near the prospects. Very little, however, was accomplished in the way of development and aside from the operations of a few persistent prospectors everything became dormant for a series of years. At the time of my visit in October, '97, work was being resumed chiefly on the principal location, the Peacock; ore was being taken out and a small smelter erected on Indian Creek about ten miles south of the mines and at a considerably lower elevation. Practically no development work had been done on any of the claims in the district; nothing but some open cuts, small tunnels and shallow shafts were seen, a somewhat remarkable fact considering the many years during which the deposits have been known. During the summer of '98 the smelter was in operation for some time, producing copper matte which was shipped to Weiser; some thousand tons of ore were mined from the open cut on the Peacock claim, but very little development work was done. On an adjoining claim, the South Peacock, it is stated that a 130-foot shaft has been sunk and 500 feet of drift run. The results of this prospecting have not been made public.

Many varied and sometimes erratic projects have been advanced for the establishing of communication with the railroad. At least twice have plans been made for building a railroad to Weiser; other schemes include an aerial tramway from the mines to the river and transportation by steamer to Huntington; one of the latest projects involves a railroad line along the river from Huntington to a point south of the mines.

Topography.—After leaving the smelter site on Indian creek the road passes up the western side of this creek, ascending the valley side until, some miles from the smelter, Lockwood Saddle is passed. For two miles the road then runs along the slope of the main canyon of Snake river, affording a magnificent view westward and southward. Then across a broad salient from White Monument hill into the upper, more gently sloping valley of Deep creek, which a short distance northward turns into a precipitous canyon joining the river a few miles farther on. In this upper part of Deep creek are situated the Peacock and other prospects while still others are located farther south, near Lockwood Saddle. Scattered fir and black pine partly cover the gentler slopes, but the abrupt canyon sides are rocky and bare.

Geology.—The principal rocks of the Seven Devils are green porphyries of various kinds, most of them old, partly altered andesites and rhyolites, accompanied by frequent agglomerates and tuffs. In this series are embedded larger and smaller masses of sedimentary rocks, consisting of highly compressed black slates, tuffaceous slates and limestone; in the latter crinoid stems were found and its age is probably Carboniferous. The whole series is exceedingly similar to that from certain parts of the Sierra Nevada. The effusive porphyries are largely, at least, contemporaneous with the sedimentary rocks. Between Peacock and Lockwood Saddle is an irregular area of diorite, enclosed in the porphyries and probably intrusive in the same. Extending from a point south of Lockwood Saddle to White Monument, about a mile south of the Peacock claim, is a narrow band of highly crystalline limestone or rather marble; this is enclosed in diorite.

The Mineral Deposits.—The principal interest centers in the Peacock claim, which has been developed more than any of the others and which shows a large ore body. This claim is situated near the head of Deep creek and is one of the most northerly claims in the mining district. It was the first one located, having been found by miners who were making their way up the creek prospecting for gold. A little placer work has been done just below the claim, the the gold evidently resulting from the decomposition of the copper ores. The deposit is well exposed in an open cut and shows an ore body about 35 feet wide. On its eastern and western side this ore body is adjoined by a coarse diorite. The ore consists of bornite or Peacock ore, part of which is altered into malachite. The gangue consists of epidote, garnet, and a little quartz and calcite; there are also streaks of specularite running through the mass in various directions. About 200 feet south of the open cut the ore body is cut off by a mass of green porphyry, which only contains some slight copper stain. North of the cut no copper ore has thus far been discovered. No fissures or fault planes appear to separate the deposit from the surrounding rock, though the line of demarcation is quite sharp; nor are there any evidences of fissures in the ore body itself. There is no doubt that a large body of copper ore is here exposed. As to its percentage of copper I have no exact data, it may possibly be in the neighborhood of 10%. A short distance southwest of this claim is the South Peacock on which some work has been done this year. In '97 a small shaft was noted, sunk in coarse diorite, and on the dump some bornite and malachite as well as epidote and garnet were found. The ore here shows more quartz than in the claim first described.

About two miles south of the Peacock a long series of claims begins, on all of which more or less copper ore has been found. In no case, however, are the developments extensive. The most northerly of these claims is the White Monument, located several hundred feet above the road near a prominent mass of crystalline limestone imbedded in the diorite. This limestone, a few hundred feet wide, is bordered by a streak of garnets on each side along which chimneys of rich ore have been found. About a mile south of the White Monument follow the Lockwood, Alaska, Queen, Blue Jacket, Helena, and other claims, all of which appear to follow a narrow streak of highly crystalline limestone which, again, is imbedded in the diorite. The Alaska is located about a quarter of a mile east of Lockwood Saddle referred to above. The deposit lies on the contact between crystalline limestone or marble and diorite, and its character is that of irregular bunches of bornite, malachite and chrysocolla, with a gangue consisting of garnet, epidote, specularite, quartz and calcite. The general character of the other claims in the vicinity is similar to that of the Alaska.

Type of Deposits.—The copper deposits of the Seven Devils as described above are typical contact deposits formed by the chemical action of the diorite on the limestone when the former was intruded in a molten state into the sedimentary series. Especially intense, naturally, was the metamorphic action on smaller masses of limestone torn loose from the main mass by the intrusion. The garnet, epidote, specularite, etc., which form the typical gangue of the deposits, are the characteristic products of contact metamorphism of limestone. The copper sulphides certainly appear to be formed at the same time as the garnet and the epidote, and their origin must be sought in the superheated waters which accompanied the intrusion and found their way from the cooling magma which evidently was in a state of aqueoigneous fusion. The origin of the copper ore is, therefore of a pneumatolytic character.

The only difference between the Peacock deposit and those farther south is that in the latter the limestone mass is larger and only metamorphosed along the edges while the Peacock represents a small detached fragment of limestone wholly altered into contact minerals.

Similar Deposits Elsewhere.—It is well known that many iron and copper deposits occur, similarly to this, on the contact of granitic rocks and limestone. Some noted deposits of this kind occur in the Old World, but there are no lack of them either in our western country along the Cordilleran mountains, where intrusive granitic rocks are so abundant. I have noted similar copper deposits in California in several places, though, as a rule, they are not economically of great importance. All are characterized by a gangue of garnet and epidote, and the ores are apparently always bornite and chalcopyrite. None of them seem to be connected with fissures or fault planes. One of these deposits is found near the road from Coloma to Pilot Hill, El Dorado county, another in the canyon of the Middle Fork of Cosumnes river, three miles northeast of Fairplay, also in El Dorado county. Still another is found in Hope valley, Alpine county, and is known as the Barnes mine. According to reports there are many other deposits which may be referred to this class, thus, for instance, the copper prospects in Lost river valley, Idaho, near Heuston. Further, some deposits on Boundary creek in British Columbia, and others on Texada Island, in the same province. From notes in the reports of the Provincial Mineralogist of '96 and '97 there cannot be much doubt of the character of the last mentioned deposits. Mr. Ordonez mentions the occurrence of similar deposits from several places in Mexico, where intrusive diorites come into contact with Cretaceous limestones. Here, as in many other cases, these contact deposits carry some gold. None of the large copper deposits of the world appear to belong to this type.

Question of Permanence.—Ore bodies of this kind are pretty certain to be of very irregular outlines. However, if the contact continues in depth there is no reason why good sized ore shoots should not be found along it; in other words the conditions for the formation of these ore deposits were surely as favorable in greater depths as at the present surface. It must be remembered that the surface at the time of the intrusion of the diorite was far above the present one. Actual exploration only can decide the question of the permanence and size of the ore bodies in the Seven Devils district.

Cyaniding Base Ores.

Written for the MINING AND SCIENTIFIC PRESS by MATT W. ALDERSON.

The ideal liquid process for gold and silver ores containing antimony, arsenic, etc., in combination with sulphur has not been discovered; or, if it has, has not so established itself thus far as to make its importance felt. The nearest approach to it, in my opinion, is chlorination; but, unfortunately, that does not make a saving of the silver values that may be in the ore, and it is more expensive than cyanidation. The ideal treatment for ores of this class is an acid treatment, and I believe that to the fact that the solvent in chlorination is acid is due in a great measure the superior record in the past of chlorination over cyanidation in treating certain classes of material. I believe that the acid assists in freeing the gold from the metallic combination in which it is held, and is to be credited with what is usually claimed to result from the penetrative power of the chlorine gas. But this is simply an opinion. We are face to face with the fact that we need a process for certain classes of base ores, and as cyanide is the only solvent by which we can hope to make a saving of both gold and silver in an ore, we must depend on that.

There are two kinds of pyritic ores from which one may secure a fair extraction without first roasting. The first is the typical pyritic ore where the sulphide occurs in cubical form and the gold is in a free state in the honeycombs of the cubes. The second is a sulphide presenting very much the appearance of a granulated substance like sugar, so held together as to give the impression that a few blows would separate a chunk into its individual particles. An extraction of 70% to 80% can be secured from these ores, treated raw, providing oxidization of the sulphides is not fairly under way. If it is, the consumption of cyanide will be so great as to preclude good work without roasting.

Arsenical ores are successfully cyanided at the Golden Gate mill at Mercur, Utah, after receiving a preliminary roast, the credited extraction being 75% to 80%.

The base ores of Cripple Creek are handled without difficulty after being roasted. The tellurium is soon driven off in roasting, and all roasting tests are made on the quantity of sulphur. The proportion of sulphur is not great—about 2%—and over 90% of this is eliminated. On ores of $20 valuation an extraction of 90% is secured, a still higher per cent on richer ores and lower on those of lesser value.

Authorities on cyanide work tell us that a good extraction can be secured from antimonial ores by fine grinding and long contact, but that the usual practice is to subject the ore to a preliminary roast. I confess to having made several hundred laboratory tests on this class of material before I satisfied myself that in neither way could one do as good work as he would wish to do in running a plant. I have taken tailings from a mill where about 50% of the values in the ore had been extracted by amalgamation and concentration, and by pulverizing to 120-mesh and leaching for several weeks I have succeeded in making an extraction as high as 80%. Taking the same material with the idea that all coarse gold and all antimonides of appreciable size were removed from it, and subjecting it to a thorough roast and then leaching it, I have failed to do even so well. I have roasted and reroasted, thinking that part of the work had been imperfectly done, but results were uniformly unsatisfactory. Finally, after repeated failures on a sample which I was determined to master, I concluded to pan the ore after roasting. I knew the gold in the ore, which had been removed by amalgamation, was coarse, even in some instances being what would be called nuggets. I sought to ascertain if the gold after roasting had such a body to it as to prevent its being dissolved by cyanide in reasonable time. Chemically combined in the first place with the antimony and sulphur, the roasting should leave it free to be saved in one way or another. In my first pan colors were found which would not pass the mesh of the screen through which the ore had passed prior to its being roasted.

The problem was solved. After the coarse gold

had been removed no difficulty was experienced in securing a good proportion of the remaining values. But how did the coarse gold get there? It was certainly not in the material originally. How came it to be in the roasted product?

In the process of assaying we add litharge to the charge, and the resulting button is lead and gold, chemically combined. If we were to pulverize the lead to pass a 60-mesh screen—that is, if it could be done—we would know that the gold would be in a very finely divided state. If we were to mix this pulverized material with quartz and roast it, the lead would be driven off and the gold would be left in a free state. But would each individual particle remain separate, or would not the reasonable probability be that several of the particles would come together? It is understood, of course, that pyrites would not become fluid at so low a temperature as lead. But have we not considered the finely divided and separate sulphides and other ides as distinct particles whose natural tendency would be to remain such, especially with silicious material intervening, even though subjected to the intense heat of a "dead roast?" Some of the particles would no doubt be side by side in roasting, and as the base substances were driven off, what would be more natural than that they should practically fuse together? There is no doubt that they do.

In a previous article I have spoken of coarse gold being recovered by concentration from Cripple Creek ores after leaching, when there is an absence of such in the original ore. If we take a piece of an unoxidized telluride ore, rich in gold, bring it to a red heat and then plunge it into water, we will find on its removal that the surface is covered with particles of gold. This gold will generally appear in two forms on each sample. One form will be globular and the other like a splash, as if a drop had fallen on the surface and had spread out in all directions. Prof. Arthur Lakes, in an article on "Tellurium and Telluride Ores of Cripple Creek, Colorado, as Illustrated by Specimens in the State Mining Bureau, Denver," says (*Mines and Minerals*, July, '98): "From the Victor mine is a fine specimen of roasted telluride rock. The gold covers the rock in rough, hollow bubbles about the size of a large pin head. Sometimes these bubbles have burst and look under the magnifier like the open craters on the surface of the moon. By the side of this roasted specimen is a cut and polished sample of the original ore. It is a breccia consisting of a darkish ground mass, in which are imbedded gray fragments of rock, traversed by dark veins, showing streaks of telluride."

From the evidence thus far it would seem that the natural tendency of gold sulphides when subjected to the heat of a roasting furnace is for the gold to assume the globular form, somewhat similar to its action in the process of cupelling. With the more volatile base substances this will be more perfect. The fact that with telluride ores these globes are hollow explains why such success has followed the leaching of this class of base gold ores. When the particles had more body to them the cyanide or chlorine has been unable to dissolve them, and this explains why they can be recovered from the tailings as concentrates in the form of coarse gold. Everyone knows the difficulty of roasting sulphides without their matting together. If they matte and all the sulphur is not driven off, a concentrate is the result. If all the sulphur is eliminated, coarse gold must remain. If it were possible to so roast sulphides as to separate each molecule of sulphur from the molecule of gold incorporated with it, then in finely crushed material no difficulty would be experienced in dissolving the gold, but in actual practice this is an impossibility.

It follows, then, that in treating antimonial, arsenical, telluride and most sulphide ores amalgamation and concentration must follow roasting, either before or after leaching, as may be most convenient. The preferable way would seem to be before, as with the coarser particles recovered it will be easier to determine when the leaching has been properly done and the extraction made complete.

Mining as a Legitimate Business.

That mining can be carried on as legitimately as merchandizing or manufacturing needs no argument. At the same time there is likely to be no field of operation so productive of worthless and fraudulent ventures as that of mining. There is no section of the country where some people are not holding worthless mining stocks bought under this or that scheme under promise of making a bonanza investment. And not one in a thousand of these schemes ever get beyond the beautiful pictures which are painted to those who buy the stock. Yet, this fact does not impair the possibilites of legitimate mining, distinguished from mining stocks when carried on under proper safeguards and on lines of actual and systematic development.

Mines are made by putting labor and means into the property itself and not into the stock and pockets of the promoters. Few mining properties, indeed, which show any possibilities of becoming mines with development, and which in fact justify exploitation disappoint the miner upon his outlay. There is to-day a greater demand for good, developed mines than heretofore in the history of the mining States, and larger developing projects are constantly being undertaken. Brought down to a true economic working basis mining (not speculating in mines) offers greater returns upon the capital invested, and is upon the whole no more hazardous than any ordinary mercantile venture.

To develop any kind of a mine capital is necessary. There are those who have the means to individually accomplish this; but such instances are few. It more often requires the united capital of several to accomplish anything in this line. How to associate a number of people in an enterprise to raise the necessary amount required for a developed proposition, has been the stumbling block in the way of many ventures. Stock propositions have been resorted to, and are the means by which it is usually accomplished. They are safe and convenient means to the end, if lawfully and judiciously employed. The provisions of statutes, however, are in most cases evaded, rather than followed, and the stockholder left without protection from liability on his stock or recourse from his losses.

Again the stock is too often manipulated in the interest of the few to the prejudice of the many. The property of the company if of any value, oftimes run into debt, is sold out and bought up in the interest of the few. But these methods are perhaps less to be condemned than the more vicious practice of floating large stock schemes upon worthless property, merely to market the stock for what it will bring, or speculate in it on the boards. The capital is fixed at a figure to give ample paper for the transactions, and while it represents in the eye of the law the amount which is actually paid into the corporation in money, property or services, at a fair and reasonable valuation, it is found in the hands of the promoters, fully paid up (?) and non-assessable, and offered, in most cases, at a fraction of a cent of its par value. While such propositions in most cases bear the stamp of fraud upon their face, too many have been unwittingly entrapped into dealings with them, hoping for large gains on so small an outlay, or to gain something for nothing, failing in which they condemn all mining ventures.

Notwithstanding all this, there have been many great mines, gold and silver, which have produced many millions of dollars in wealth to the owners, many which are to-day swelling the world's stock of the precious metals, and many more discovered each year and made to produce great wealth. All had first to be developed; for mines are made, not found. They are the result of expensive exploitation and economic engineering, not the result of stock speculations.

Disbelief in the "Ancient River" Theory.

TO THE EDITOR:—Many miners, scientists and other people have been interested in the study of how the great gold-bearing gravel leads or channels were formed. Several theories have been advanced to account for their occurrence, the generally accepted one being that of some prehistoric river flowing from somewhere in the north and dumping in the ocean somewhere near Monterey bay. A few have the idea that the present river systems are responsible for the vast deposits of auriferous gravel found in the Sierra Nevada range, but that in consequence of the elevation of the land and the depositing of lava from now extinct volcanic vents, the course of the rivers have been changed. But no theory advanced explains the presence of marine shells found in many of the gravel channels and in the gravel found under the "hardpan" of the northern part of the Sacramento valley, and in that section of the State the gold-bearing gravel may be traced from the channels in the hills to where it disappears beneath the "hardpan," which in large part constitutes the floor of the valley. My observations as a miner and prospector lead me to reject the ancient river theory as untenable, because of the presence of innumerable beds of marine shells in the sand lying over the gravel in a large part of the gravel section. Where those shells are lacking the character of the gravel appears to be the same, a difference in color, but otherwise it everywhere appears to have been derived from the same rocks and earths, with the exception of the material overlying the gravel to the south and east of a line drawn from the headwaters of Feather river, near the State line, following down the river to Oroville, in Butte county, thence skirting the edge of the foothills of the Sierra Nevada range south to a point in the San Joaquin valley opposite the northern end of the Mount Diablo range of hills, crossing the valley and following the western flank of that range south to a point opposite the southern shore of Monterey bay. We will find that the gravel is overlain with what the miners call pipeclay, and this deposit contains no fossils, except petrified wood and a few leaves from the same kind of timber and brush as may be found growing on the surface of the so-called lava that covers the pipeclay. North and west of the line drawn the gravel is to a large extent covered with red sand, hardened at places so that it is of the nature of stone; above this is the lava that covers most of the mining region. And this part of the country appears to have been formed at a much later date than that to the south of it. South of the line but few fossils other than petrified wood have ever been found, a few impressions of ammonites and belemnites in some of the slates making up the list. This part of the country rose from the waters so long ago that the fossil remains that were probably once there have almost entirely disappeared, much of the pipeclay over the gravel containing sufficient alkali to destroy any shell remains.* Petrified wood does not prove the existence of an ancient river system, as such wood has been found on the crests of some of the highest lava and granite ridges of the Sierra Nevada range, as well as in the Great Salt Lake and Colorado river basins. North and west of the line referred to the country is rich in remains of marine shells and plants, with portions of the skeletons of some prehistoric animals or reptiles. The shells and plants are of the same character, whether they are found on the remains of former sea beaches near the mouth of Russian river and other points on the present coast line, now far above sea level, or in the Contra Costa hills, the low buttes near the shores of Suisun and San Pablo bays, or the eastern flank of the Coast Range, under the hardpan of the upper Sacramento valley or the western flank of the Sierra Nevada range from Oroville to some distance above Redding. All these things go to prove that there was no such thing as a prehistoric Amazonic river system, having its rise far to the north and emptying into the sea near Monterey bay. The traces of former sea beaches found on the coast are duplicated on the foothills of the Coast and Sierra Nevada ranges, not only in appearance and number, but in their elevation above the level of the sea, where the hills border on the sides of the upper Sacramento valley, from Oroville for many miles northward, wherever the flow of the lava was strong enough to reach the shores of the then inland sea, now the Sacramento valley. It is argued by scientists that the Pacific coast line is slowly rising at the present time; the story told by the former sea beaches is that there were periods of sudden upheavals of large extent of territory for many feet at a time, and in so short a space that the waves of the sea did not have time to form even the semblance of a beach between the times when the cataclysms began and quiet was again restored.

It is recognized that quartz veins received their contents from the interior of the earth, and I advance the theory that the veins were forced into place while the land in which they lie was still beneath the sea, and during the different periods of convulsion the apex of the veins were broken and crushed, and the sea, driven into swift-flowing currents, formed the sand and gravel and deposited it in the lower parts of the sea bottom, the lava being deposited at a later date before and after the gravel deposits rose from the water.

This theory will account for the presence of sea shells above the gravel in the hardened sands, for the petrified wood in both the sand and gravel, and for the difference in the color of the gravel deposits. The older quartz veins were of a blue color; from those the gravel of the blue lead was derived, and also the pipeclay, or, rather, the quartz portion of the pipeclays of the older portion of the State. Afterward the red veins made their appearance; from the debris of these the red gravel was deposited over the blue lead and such low parts of the sea bottom as were not occupied by the blue deposit. The theory will also account for the difference in the degree of oxidization that has taken place in the metal-bearing veins north and south of Feather river; the country south of the river rose from the sea ages before that north of the stream, and its veins are oxidized to a much greater depth. It will account for the somewhat odd position of the outlet of the two great river systems of the State. The more natural outlet would appear farther south; but during the periods of sudden upheaval, after the tops of the Coast Range had risen far enough to enclose the water in what is now the Sacramento and San Joaquin valleys, each subsequent and sudden elevation of the bed of the enclosed sea caused a resistless rush of the water from north and south to the lowest part of the coast line, and, following the course of one of the greatest fissures—that were there owing to its being then, as now, near one of the centers of seismic disturbance—swept the debris to the depths beyond, and thus formed the Golden Gate. A careful study of existing conditions in the country south of the Columbia river and west of the Rocky mountains, down to the Mexican line, will lead the student to the belief that, some thousands of centuries before the Spanish novelist's ideas acquired form, and are said to have given our State its name, the "Isles of California," were not a myth.

E. H. MOORE.

Nevada City, Cal., Jan. 21st, '99.

*Much of the pipeclay in Yuba, Nevada and Placer counties is yet so strongly impregnated with alkali, as is also the lava deposit above the pipeclay, that any shells or remains of marine growths would soon yield to its destructive action.

It is estimated that from 1801 to 1888 the world has produced 12,700,000,000 tons of mineral, of which 10,601,000,000 tons were of coal, 1,275,000,000 of iron, 612,000,000 of gold quartz, 49,000,000 of silver ore, 80,000,000 of copper and 80,000,000 of lead ore.

Mining Summary.

ALASKA.

The Sumdum Chief and the Bald Eagle mining companies at Sumdum bay have been consolidated into the Sumdum M. Co., paid up capital $200,000. N. S. Trowbridge continues as Mgr. It is the intention to push the main tunnel through the Bald Eagle ground and on to the Sumdum Chief mine, until the ore bodies of the Chief are fully developed, thus giving to the new company ore backs of 800 feet below the bottom of the Sumdum Chief shaft, or 1100 feet from the croppings at the surface.

ARIZONA.

Near Big Bug the Oriental M. Co., represented by W. A. Kent, owns fifteen different mines and a mill. They are running a tunnel which, when completed, will be 5700 feet in length. The Lottie has developed a body of ore that warrants this. By compressed air the tunnel has been driven 1000 feet.——At the Red Jacket, a new mine opened by S. J. Fleming, a steam hoist is in operation. The shaft is down 100 feet and the ore taken from the drifts is being milled at the Annie.——The Redrock is one of Big Bug's well developed properties. The shaft is down 314 feet and drifting has been done 2200 feet. The mine is owned by Spruance, Stanley & Co. of San Francisco. The mine produces gold, silver and copper. The gold will average $25, while the copper and silver will pay for the shipping and smelting.——In the Annie mine the shaft is down 381 feet and ore is taken from three levels. The company contemplates putting in a concentrating plant. They have 1000 tons of concentrates on the dump.——The Sterling mine is owned by Taft & Dunn of Binghamton, N. Y. The shaft is down 80 feet. Ore is being taken from the 60-foot level, 115 feet north and 248 feet south. A carload of ore was shipped last week and three more carloads are on the dump waiting improved condition of the roads. The company intends putting in a hoist to sink a 500-foot shaft. The ore taken out will average $30 to the ton and the pay streak averages 12 inches.——A mining sale was consummated in Tucson between F. A. Huntington of San Francisco and Richardson, Morgan & Wise, owners. The property is known as the Virgin Copper mine, in the Patagonia mountains near Crittenden. The price was $40,000.

Cook Bros. are pushing work on their gold mine at Virginia Camp. They have a 15-inch streak in the vein that averages $100 in gold, besides a large amount of good milling ore.

Near Mayer, the recent strike at the Senator, from a mill run last week of forty-one tons, yilded $30,000 in bullion. One ton of picked ore resulted in a cleanup of $8000.

J. Cope last week sold two mining claims at Tonto Basin for $35,000 cash. These mines run free gold and concentrate ore.

Phœnix *Republican*: Near Cherry creek station, the North American Expl. Co., through its representative, G. W. Middleton of Denver, has eight mines called the Dewey group, all named after eight of the principal cities of the U. S. Work is confined at present to the Denver and Chicago claims. On the Denver two shifts are working. Since Dec. 1 a shaft has been sunk on this mine 75 feet. A gasoline hoist will be put in service shortly. The Boston & Arizona Copper Co. has six claims adjoining the Denver group and has sunk a shaft 160 feet deep on one of the mines. The company has fifty tons of shipping ore already on the dump.——At Huron, a new mining town, the Swindler mine employs twenty men. The Wingfields have six valuable claims near by and are doing development work on all of them. They have an assay on ore taken from the Last Chance mine in this group that shows $80 gold, $20 in silver and 14½% copper. They will soon begin shipping ore.——G. Rhopeter, on the Lone Pine mine, has done 400 feet of sinking and tunneling on the property. He has a 2-foot vein of ore that goes $100 to the ton.——The North American Expl. Co. is interested in the Montezuma group of seven claims near the Swindler. A shaft is being sunk. Copper develops in paying quantities.——A. Knackenberger, on the Mountain Chief mine, is taking out ore that shows $20 in gold, $4 in silver and $50 in copper. It is plain that the new railroad has added a considerable impetus to mining in this section, which abounds in gold and copper from low grade, but merchantable ore, to that of high assay. Mines are now worked in this and adjacent territory that could not be touched before, because of cost of transportation of ore.——At McCabe, known as Chaparral before the postoffice was given the name of McCabe, on the McCabe mine, owned by Wells, Parsons & McCrum, one of Yavapai's greatest producers, the mill is running night and day, employing fifty-five men.——The Jessie mine, which in the past has produced over $600,000, is idle, but it is locally believed the mill will be running full capacity before the summer is ended.——In the Gopher mine, near McCabe, being operated as the Gopher G. M. Co., Seattle people are interested with M. Hanna. The shaft is down 220 feet and a gasoline hoist is in use. Three hundred feet to the south another shaft has been sunk 100 feet and the two shafts are connected by a drift. Ore is being taken out of both shafts, furnishing employment for fifteen men. The shipping ore runs $70 to the ton. The low grade, averaging $20, is held for the new 5-stamp mill that will be erected at once.

CALIFORNIA.

Amador.

Sutter Creek *Record*: The Sternemans have started work on the China Hill mine near Pine Grove.——At the Lincoln mine, Sutter Creek, they are cleaning out the sump at the 800 level and Feb. 1st will begin sinking the shaft 400 feet deeper.——The Amelia mine has encountered the ledge at the 800-foot level.——The Blue Lakes people have 125 men on the ditch work.——The Ballot mill started up last Sunday and is running on half time.——The old Camp Contreas mine, now known as the Watkins in Pioneer district, twenty-five years ago produced a large sum of money and was abandoned. A year ago Watkins relocated the claim and after sinking struck into a body of ore and shipped ore that yielded $15,000. Last week Watkins sold the mine to San Francisco people for $45,000.

Jackson *Ledger*: About fifteen men are employed at the Ivanhoe mine at Plymouth. The mill is running with good prospects for its continuing.——Milling the dump at the Empire mine at Plymouth is in progress and is yielding satisfactorily. Two more Huntington mills will be put in.——M. Byson recently secured an option on the Bay State mine and commenced to reopen the property. About twenty men are employed. The mill is in operation.——The Centennial mine near Drytown was examined last week by A. M. Womble of San Francisco, F. H. Brown of Melrose, Mass., and E. I. Drisko of Boston, with a view to purchase.——About twenty men are employed at the Douglas mine at Pine Grove. Crosscutting and running three levels is being pushed.——The 10-stamp mill on the Allison mine at Plymouth, the property of Stockton people, will be ready to crush ore in about three weeks.

Jackson *Dispatch*: The new shaft at the Kennedy mine at Jackson is down 50 feet. Sinking is done by three shifts of three men each. The air compressors will be in position in two weeks, when it is intended to use steam drills in sinking.——Supt. Haley has opened up a large body of ore in the Paragon group of mines, and the mill is to be put in operation in a few days.——The Porteous Bros.' claim near Jackson is yielding fair returns.——At the Anita mine they have stopped sinking and are driving from the 750-foot level.——Driving the tunnel to crosscut the ledge at the Butte Mountain mine is progressing, they have passed through the rim of hard rock encountered some time ago.

Jackson *Republican*: Crosscutting is being done at the Oneida mine at Jackson.——At the Argonaut everything is running in good order.——At the Ivanhoe sinking is in progress. Twenty stamps are in motion.——At the Keystone mine, Boulder City, fifteen stamps are working. A gasoline engine is being put in at the mill.

Butte.

The *Register* reports that at Cherokee men are at work on a tunnel to test the ground for gold where there is a dispute as to the ownership of the land. A part of the Cherokee mine was taken up under a location and the company had no patent for it. W. P. Lynch took up the claim under a homestead right and declares it is not mineral land.

Calaveras.

At Murphys, work is being pushed at the May Day mine.——The Utica Co. has a force widening the Utica ditch, to convey water to the San Domingo M. Co., at Dogtown, which is ready to start up.——The Big Horn mine will start work soon.

San Andreas *Prospect*: At the Thorpe mine, at Fourth Crossing, the company is beginning extensive operation in the development of the mine and the reduction of ores. The 30-stamp mill was started up last week and works successfully. There are twelve concentrators. The old shaft has been enlarged and retimbered. The old dump, which has a large quantity of good ore taken out of the mine under the former management, will be milled. The mill, concentrators and rock breaker are operated by electric power. Hoisting is done by steam, but will eventually be supplanted by electricity or by compressed air. All the works are lighted by electricity. Sixty men are employed.

San Andreas *Citizen*: Near Angels Camp, work has begun at the Last Chance mine once more. C. D. Lane held a bond on this property two years ago, sunk an 80-foot shaft, run a crosscut and quit work.——The Bald Hill mine is being unwatered, preparatory to inspection for purchase.——The Carson Creek M. Co. have been clearing out their ditch and the property will be started up shortly. There is a 40-stamp mill on the property that will be put in running order.——Preparation is being made to start up the old Angels mine, known as the Coleman property.——The Santa Ana mine, at Carson, is running full capacity.——The Vallecito M. Co. have given up their old shaft and started a new one.

Kern.

Randsburg *Miner*: R. F. Harrison is putting up a 10-stamp mill on his mine in Pleasant canyon near Ballarat.——The machinery of the California Borax Works started up this week. They will make the first shipment of their product Feb. 15th. They will ship about 100 tons refined borax per month.——The Hard Cash mill near Randsburg is working. The Hard Cash is a heavy body of low-grade ore. The mill is capable of grinding and concentrating a ton an hour. The first concentration puts about 22 into 1, then a second time through reduces this about 15 to 1, making a total concentration of over 300 to 1. Arrangements are being made to amalgamate the concentrates. Another mill is on the way.——At Johannesburg C. A. Burcham has purchased the Golden Rule mine and will soon begin operations on the property.——Koehn & Wilson are sinking again on the Ruby mine.——E. Bryden is taking out ore from his Rustler mine.——In Tuber canyon in the Panamint country the Montgomerys have milled the ore from two shafts, one 400 feet deep, and it averaged $26 per ton.——The Yellow Aster mill at Randsburg began crushing ore this week.

Mariposa.

(Special Correspondence). — It is reported that the Merced Co. will shortly enlarge their mill by adding twenty stamps to the forty now in operation.

The Supreme Court has set aside the conviction secured in the local court last spring in State vs. Opie, the somewhat celebrated Merced ore-stealing cases. The two Opies were accused of stealing a large amount of specimen ore from the Mary Harrison mine and after two trials one was convicted of petit larceny. As the case has already cost Mariposa county nearly $4000, it is thought the matter will never come to trial again.

Mariposa, Jan. 25th, '99.

Nevada.

(Special Correspondence). — The old time activity in this county in the milling industry of ores which for a time lay dormant during the dry season of last autumn has revived and all the wheels are again turning.

Precautions are being taken by the several water companies against the recurrence of any failure of water supply, by building storage dams and reservoirs. Together with this electric power is becoming a dominant feature in many of the mines, and Nevada under any circumstances will be well provided against the repetition of last season's stoppage of work in mines and mills.

Prospecting and development work have been greatly stimulated and it is safe to say that the opening of properties destined from present appearances to become producers is a certainty.

The placing of machinery is likely to assume greater proportions this year on new properties in this county than has been the case in an equal period at any time.

The Washington and Maybert sections and Grizzly Ridge country have especially done much new work. The same may be said of Graniteville, Rough and Ready, as well as the neighborhood of Grass Valley and Nevada City.

Grass Valley, Jan. 23rd, '99.

Nevada City *Transcript*: Gray & Bullard, on their hydraulic mine at Gravel Hill on Little Deer creek, are running full capacity. Major Heuer of the U. S. Debris Commission last week inspected the arrangements for impounding the tailings and pronounced the restraining dam one of the most efficient structures of the kind built under the terms of the Caminetti law. It is 50 feet high, nearly 200 feet long, and made of log crib-work filled with stones. The whole is anchored to the bedrock. The water has a fall of 150 feet. One monitor is employed.

Grass Valley *Union*: The new 10-stamp mill at the Texas mine, near Nevada City, was tested last week and made a successful trial run. Changing the machinery so that the water power can be used will be completed in three weeks and the shaft will be provided with a cage.——Phelan Bros. of Shady Creek have bonded their mine to W. E. Monroe and others of Nevada City.

Nevada City *Transcript*: Nihell Bros. had a crushing made from the Union mine at Banner Mountain and the cleanup was satisfactory.——The Reddick drift mine, near Nevada City, started up again this week. Supt. Skewes has a force at work in all departments, and forty men find employment. The shut-down was occasioned by a failure of the water supply and later by the blocking of the ditch by snow.

Grass Valley *Union*: At the Brunswick mine near Grass Valley a new 15 and 11-inch pipe line 1400 feet long will be laid to bring water from the Maryland line.

Placer.

The Blue lead at Dutch Flat has been found again after being lost trace of for many years. A tunnel 780 feet in length was driven under the lava capping when the lead was encountered. The cement gravel is of good grade.

A large force is employed at the drift mine at Gold Run cleaning out the old tunnel. A pipe line will be laid when the mine is reopened.

Riverside.

The Gold Canyon M. Co. is erecting a 10-stamp mill near Salton.

San Diego.

The Ready Relief M. & M. Co. at Banner have started their mill.

The High Peak and Roosevelt mines and a one-third interest in the Rossland mine in the Julian district have been sold to L. M. Smith by W. W. Boswell for $6000.

In the Cargo Muchacho district E. Valdez made a strike near the Cargo Muchacho mine of a ledge 2 feet in width, and the ore runs $27.70 in gold per ton.——The Philippines is the name of another strike in the same neighborhood of a ledge 4 feet in width. The ore has an average value of $12 per ton.——H. W. Blaisdell has taken down the mill and other machinery with which he has been reducing the ores of his low-grade mines at Venus, in Picacho district. It is locally said that he is about to become interested in the King of Arizona mine and that the Venus machinery will be moved to that camp and a pipe line from the Colorado river will supply water. The closing down of the Venus property was a surprise.

Shasta.

Redding *Democrat*: All the furnaces at the Keswick smelters are running night and day, producing three carloads of copper matte daily.——For a year D. McCarthy has been stoping out low-grade ore and selling it to the smelter for flux. Recently a pay streak several inches wide was found, the ore from which assays an average of over $200 a ton.

Ellery & O'Shay have secrved a lease upon the Milkmaid mine in the French Gulch district and will commence working the property Feb. 1st.——The Hart mine at Hart is in possession of the Bank of Tehama county at Red Bluff, which has started to unwater the mine. When the mine was worked a shaft was sunk from the lower tunnel to the depth of 200 feet. The tunnel strikes the ledge at a depth of 900 feet.

Sierra.

E. K. Downer, long and honorably connected with Sierra, Cal., journalism, is in San Francisco. From Mr. Downer it is learned that rich quartz has recently been struck in the Kenton quartz mine near Alleghany. From adjacent property, the Oriental, water has been drained 160 feet to the fifth level, 75 feet above bottom of shaft, by a pump with capacity of 500 gallons a minute.

Pay gravel is being taken out of the Worth Fork drift mine near Forest City.

The Oriental mine near Alleghany has been unwatered to within 70 feet of the bottom of the shaft, 600 feet having been cleared of water since last fall. Supt. Hill will put in another pump and start a drift from the 600-foot level.

Siskiyou.

Yreka *News*: At the King Solomon mine on Salmon river they are milling with good results.——Good milling ore is being taken out at the Black Bear mine where they are sinking.——Peterson Bros. at the Eddy's gulch claim in the Salmon country are piping with a good head of water.——Travers & Johnson are working a claim on Six Mile creek that was abandoned by Chinamen, and are getting good returns.——The Madame Clark hydraulic mine near Scott Bar has started up and is running full time.——A San Francisco company is examining the Black Jack quartz mine near Hornbrook, with a view to purchasing and developing the property.——Pane & Steele, the lessees of the McCarthy hydraulic mine, have begun operations.——Sulphurets from the tailings of the Black Bear and Yellow Jacket mines were treated at the Selby Smelting Works recently and yielded $100 per ton.——The Never Sweat mine on Mill creek is showing good prospects.——The Aromas Co. are pushing work and will soon begin piping and elevating.——The new mill at the Sheba mine on Patterson creek is ready to start up. The ledge is 22 feet wide, yielding $50 per ton. The property comprises about 200 acres.

Yreka *Journal*: The tunnel at the Golden Star mine on Humbug, formerly the old Spencer mine, is in over 600 feet.——In the Callahans, Scott River district, five quartz claims were opened last year on which work will be continued in spring.——The Montezuma river claim at Callahans is worked with a full force and a good supply of water.——The quartz mill of the Yreka M. Co. at Salmon river has been started up and men employed to get out ore.

Trinity.

Mrs. U. Blakemore of Lewiston, has men doing development work on the Daisy quartz mine. While driving a crosscut a good ledge of sulphuret ore over 3 feet in thickness was encountered.

Weaverville *Journal*: At Minersville, O'Keefe & Gallagher have a 5-foot vein of gold-bearing quartz. They have sunk on it 90 feet. The ore will go $20 ton. They have built an arrastra with a 30-foot overshot wheel and will commence crushing ore as soon as the weather permits.——Ryan & Co. have a quartz property equipped with an arrastra with an 18 foot overshot wheel. The company is running steadily and crushing a ton a day. The rock will average about $40 a ton.——The Enterprise Co., at East Fork, are running the mill on good ore. They are also doing development work.——The Yellowstone mine is running a tunnel to cut the ledge.——Meckel & Co. began work on their placer mine last week. They have put in a pipe line 1600 feet long and are well equipped for the season's run.——Zuella & Clark are running their placer on East Fork, and J. Watrous is also working his placer mine.

Tuolumne.

Jamestown *Magnet*: The forty stamps in the Shawmut mill, near Stent, are working by water power.——The Santa Ysabel is dropping twenty stamps on ore from the central ore chute, which is showing well on the plates. No. 1 shaft is 560 feet deep and still sinking. No. 3 hoist was started last week, and as soon as the mine is drained stoping will begin on the Knox & Boyle chute.——The Densmore mill, near Columbia, started running last week.——McCormick & Co. have acquired possession of the Vine Springs mine, which was a producer some years ago, and begun reopening the property.——San Francisco capitalists are reported negotiating for the Alabama mine, near Columbia. The vein on this property is over 6 feet wide and carries high-grade sulphurets.——At the works of the Columbia Exploration & Tunnel Co., on Gold Hill, boring progresses with encouraging results.

Sonora *Independent*: At the Lost Fox group of mines, near Sonora, as soon as the machinery arrives, the sinking of the shaft to the 1000 foot mark will begin. The tunnel will also be continued. The mine has a large water supply. Supt. Kerrigan will have a large force at work soon.——The Standard G. M. Co. have sunk their shaft 170 feet in the old Excelsior mine. Their hoist is operated by steam power. Compressors will be put up as soon as water can be brought to the mine and compressed air will be used.——Grant & Thomasson struck a pocket in their mine at Brown's Flat last week and took out $1480.——The Elsbree & O'Hara pocket mine on Brown's Flat is yielding good returns.——Copp & Jardeen of Jackass Hill shipped $2300 recently and last week they took out seventy-five pounds of gold.——At the Street mine, at Tuttletown, a new hoist is being put in to be run by steam. The mine is bonded to F. L. Wooster, who with a company is developing the property. Eight men are at work cleaning out the upper part of the shaft. When the hoist is completed, sinking will be commenced on the shaft, which is down 110 feet.

Sonora *Democrat*: The Excelsior shaft, near Sonora, has reached a depth of 170 feet, and will be continued until it is 330 feet deeper.——The Dead Horse mine has thirty-five men employed. This will be doubled and the mill started up shortly.

COLORADO.

BOULDER COUNTY.

R. G. Johns and associates in the Bryan group, near Ward, at 180 feet struck a cross

vein 3 feet wide that runs $10 in gold. At 120 feet they broke into a body of mineralized matter 10 feet wide.——Near Boulder the Denver group of mines is sacking fine ore for shipment.——The Silver Point of Caribou is making regular shipments of high-grade ore. ——The Larson Bros. have their arrangements completed for hoisting 3000 tons of ore below the Adit dump level, near Narel, and are taking out seventy-five tons days.——The Village Belle mine of Eldora is shipping high-grade ore. The New York company recently paid its second installment of $7000 on the property.

The Puzzler mine in Ward district has been sold for $40,000 to Massachusetts capitalists. The vein has received 2000 feet of development work, the ore running from $20 to $30 per ton.——Work has resumed on the Honest John mine at Ward; day and night shifts sinking the shaft and development work is pushed. The shaft is 180 feet deep.

CLEAR CREEK COUNTY.

Leasers are doing well in the Lee mine at Dumont, owned by R. M. Curtiss of New York. In the 100-foot level there is ore the entire length, 250 feet, from which they are are taking smelting ore which runs $70 a ton. ——J. A. Wheeler, at Upper Clear Creek, shipped a car of $65 ore.——The Gold Anchor has another shipment of ore ready that will run over $100 per ton.—— A mill run of twenty-four and one-half tons of ore from Maxwell and Hood strike on the Griffith mine, near Georgetown, returned 47.75 per cent lead, 34.75 ounces silver and 0.11 ounces gold per ton. The ore netted $88.11 per ton.

EAGLE COUNTY.

Ten cars of ore were shipped last week from Battle Mountain district.

EL PASO COUNTY.

Universal attention has been attracted during the week to the Isabella mine by reason of the extraordinary reports therefrom. Last Monday Manager Kilburn asserted that a streak of metallic gold 80% fine and 20 feet sylvanite ore body was discovered at a depth of 850 feet, assaying from $10,000 to $50,000 per ton, and that between the seventh and ninth levels was blocked out $5,000,000 worth of ore. The effect of such wired statement on the stock in the mining exchanges was to send it up from 90 to $1.75. In the closing months of '98 it had sold down to 22. The Isabella had paid monthly dividends of $30,000, but two years ago they ceased and the stock sagged. During the week the price went back to $1.29 and advanced to $1.65. The company is capitalized at $2,250,000; at the highest figure reached the mine property would have a value of nearly $4,000,000. The statements regarding the richness and extent of the strike have not been entirely corroborated.

Victor *Record*: The Creston Leasing Co. last week shipped from the Jack Pot mine at Victor 125 tons of ore that will average better than three ounces to the ton. This week's shipments averaged seventy-five tons per day.——From the Guess mine a carload of ore screenings returned $50 per ton and the sacked rock, of which there was about 3000 pounds, yielded thirteen ounces per ton.—— Carr Bros., lessees on the Wedge, at a depth of 280 feet have an ore body of 2 feet that assays eight ounces to the ton.——Two cars of ore were shipped from the Associated G. M. Co.'s lease on the Lovett shaft that will average two ounces to the ton.——Tillery & Co., leasing on the Fannie B., from an eight-ton shipment last week received $80 a ton. This was supposed to be a worked out mine.—— ——Last week a large body of 40-ounce ore was opened in the lower level of the Rouse lease on the Republic. The vein matter is 4 feet in thickness.——Twenty-five tons of ore recently shipped from the Zenobia yielded $35 per ton.——Steady shipments are made from the Pinson lease on the Eclipse tunnel. Last week a 40-ton shipment brought $40 a ton.—— Returns on a shipment of twenty-two tons of ore from the Carpenter lease on the Findley were $32 60 a ton.——Miller & Gray are making shipments of ten tons daily.——Returns from a 25-ton shipment from the Spratt lease the Granite give $70 a ton.

LAKE COUNTY.

The Leadville Pumping Association is raising 4000 gallons of water per minute.

One of Leadville's three railroads, the Denver & Rio Grande, is daily billing from that station from 750 to 1000 tons of ore to the various valley smelters.

The January tonnage from the Fanny Rawlings mine netted from $50 to $1000 per ton. A large output is maintained. Two-thirds of the employes are engaged in development work and the mine is showing large ore reserves. In the lower level last week some rich ore was encountered which is being sacked. It samples thirty ounces gold, 100 ounces silver and 7% copper. Much of the ore will control six ounces in gold, fifty ounces in silver and 7% copper.

SAN JUAN COUNTY.

Silverton *Standard*: The resurrection of the Sampson mine, near Silverton, is under way. The company owning the property will add fifteen or twenty more stamps to the ten that are now crushing ore. C. H. Nazro is Supt. The old 10-stamp mill was remodeled. The ore from two big veins of the Sampson group has been proven to contain from $7 to $12 in value, gold predominating, the ore being reduced from five to one in concentrates. The shaft has reached a depth of 102 feet. The company is incorporated, at the head of which W. Lennox is president.

SAN MIGUEL COUNTY.

At the Liberty Bell mine near Telluride ten stamps are running on low-grade concentrates from the dump, pending the completion of a 90-foot upraise for ventilation. The ten stamps are reducing forty tons per day, running as high as forty-five tons in twenty-four hours. An additional ten stamps will soon be ready to begin operations, and last week the framework was raised for housing another twenty stamps, giving the mill a capacity of 150 tons, with forty stamps.——The Meldrum tunnel is in nearly 1800 feet. Better progress has been made the past month than any month since the big bore was started, due to the improved nature of the ground for drilling and breaking. A number of veins have been cut and locally it is understood that some of the lodes are of a promising nature. The breast is approaching a territory known to be intersected by numerous mineral-bearing veins.——The Euclid Avenue G. M. & M. Co. recently put its new 10-stamp mill and wire rope tramway near Telluride in operation. The mill is treating from eighteen to twenty-five tons of gold quartz every twenty-four hours, while the tram has a capacity of transporting several times that amount of mineral in ten hours. The tramway is 2700 feet long, comprising but a single span. The Euclid Avenue Co. is a subsidiary company of the Colorado Expl. Co. The lead carries from 2 to 6 feet of mineral matter, most all of which is milling material.

Telluride *Journal*: The annual report of the Tomboy G. M. Co. at Telluride shows the total production of the financial year to have been $338,655, the yield of 24,620 tons of ore obtained at a total operating expense of $277,-710. The last six months produced 21,833 tons, yielding $314,930, at a cost of $179,237, including development work and improvements aggregating $47,262. The lower level, where a year ago no pay ore had been opened, shows much improvement, the ground between the lower and the upper tunnel yielding a good supply of profitable ore.

SUMMIT COUNTY.

From the Victoria mine at Frisco last week six cars were shipped to the smelter. Eleven men are employed. The composition of this ore is 72% silica excess, 1.7 ounces gold and about three-quarters of an ounce silver.

IDAHO.

(Special Correspondence).—The mines at Wallace, Wardner and Mullan are mining approximately 100,000 tons of ore per month, which is concentrated to about 18,000 tons before shipping to the smelters. The mines which produce this are the Bunker Hill & Sullivan and Last Chance at Wardner; the Tiger & Poorman, Helena & Frisco, Standard, Mammoth, Black Bear and Hecla near Wallace, and the Morning at Mullan. It is estimated that the output of these properties for 1899 will be an increase of 20% over that of 1898.

The Mammoth, Hecla and Black Bear are new properties, but their output is becoming large. The Black Bear is under bond to Larson & Greenough of the Morning and Joe MacDonald of the Helena & Frisco. They have made their second payment on the bond.

The Old Abe at Wardner is being developed by means of a 1500-foot crosscut tunnel. Good bodies of silver-lead ores have been encountered, as well as rich streaks of copper glance. Its ores are a good deal in the form of chalcopyrites. This property belongs to John Finch and St. Clair Bros. of Wardner, who will put in a compressor plant early the coming spring.

The Bunker Hill & Sullivan tunnel, connecting the mine with the mill, is being driven at the rate of 325 feet per month. It has been driven about 4000 feet, with 6000 feet more to go before completion. The 9-inch main from the compressor to the mine is two miles long and goes over a great mountain. This main will be laid in the tunnel when the latter is completed.

The value of the output of the Cœur d'Alenes is estimated at $45,000 per day.

Branscombe & Sonnemann of Spokane have just added twenty men to their force on the Cumberland mine at Silver City.

C. P. Richardson of Newsome, Idaho county, has been operating two giants on his Moose creek placers the past year. His ground is on an ancient channel, 800 feet above the bed of the present south fork of Clearwater river. He says he has two miles of ditch, 800 feet for dump, 135 feet depth of gravel and a channel 800 feet wide. WASCOTT.

Wallace, Idaho, Jan. 23rd, '99.

S. Silverman has fifteen men at work on the Big Buffalo claim, which he recently bonded. They are running an open crosscut from wall to wall to test the ledge.

A Spokane dispatch says the Buffalo group of claims in the Buffalo Hump camp has been sold to F. L. Clark and C. Sweeny of that city for $650,000, a very large price for an undeveloped property.

Near Hailey after lying idle for three years shipping ore has been found in the Red Cloud mine, formerly one of the bonanza mines of this section by leasers.

The Josephine Placer Co. will work the placer land near Boise this spring. They have 500 acres of land. The prospecting work done on the property has demonstrated that the ground is all good, while quantities of it carry high values. There are other properties in the river with some bodies of ground that are known to carry from $10 to $15 a yard.

The Weiser *Record* says arrangements were concluded in Salt Lake City on the 23d ult. that put DeLamar in control of the principal properties in the Buffalo Hump district.—— J. Warton, who has charge of the South Peacock mine in the Seven Devils for a Boston company, has bonded the Great Vale copper claim near Cuprum for $10,000.——At De Lamar next summer there will be three plants working on tailings.——The Checkmate mine at Willow Springs shipped last week its initial lot of ore from the new body that was recently encountered in the new shaft. The assays from the consignment show 3.8 ounces in gold, 12.6 ounces silver and 5.5% lead per ton, with a valuation of about $35 per ton.——Near Soda Springs there is a large deposit of sulphur, which a company has been developing for several months and shipped several carloads East for trial. A plant for refining will be put in during the spring. There will be a steam plant and melting furnaces to treat the ore by the steam process. Some sulphur shipped East went 98% and the whole bed so far opened, showing many thousands of tons, runs from 20% up to 90% sulphur.

MONTANA.

Near Revenue, the Monitor Co. shipped last week twenty tons of high-grade ore.——The Revenue mill is reducing forty tons of ore per day, and, when the new tanks are placed in position, will have a capacity of seventy tons per day.——The Galena shipped two carloads of ore recently which is said to have paid well. ——The leasers of the Pony mine, near Sterling, shipped a carload of high-grade ore.—— H. Muntzer of Butte has bonded the Emperor mine and put men to sinking a shaft.

Greenwell & Vaughn encountered an ancient bed of Libby creek and found gravel which is rich in coarse placer gold. They calculate $100,000 can be taken out next season. The tunnel has opened 70 feet of this gravel.

Butte *Miner*: The Silver King mine, in Butte, a silver property owned by Murray & King, but being worked under a lease by the Waller estate and M. H. Sanders, recently sunk an air shaft near the main shaft and connection made at a depth of 350 feet. Very little water is handled, and the lease is an ideal poor man's proposition. Ore is being hoisted from a 20-foot ledge of high-grade silver rock. About fifty tons are hauled to the smelters daily from the claim and the leasers are reaping a rich reward. Current report has it that $36,000 worth of rock was handled in December.

Butte *Inter-Mountain*: The Cable gold mine near Georgetown, which produced millions during the palmy days of Montana, is likely to be started up again after an idleness of ten years. The principal owner is J. C. Savery. The mill at the mine is composed of thirty stamps and is in good repair. There is a mountain of ore in the Cable mine, something like a ledge 175 feet wide. The Cable was one of the first and greatest gold quartz producing mines in Montana. Georgetown has one cyanide plant, which operated last year with success.

NEVADA.

In the case of Blair against Hanchett in the matter of the Silver Peak mines, Blair secured a judgment against Hanchett for $19,-200. Part of this is for royalty due on ore extracted by Hanchett and part is for alleged damages to the mine during Hanchett's lease. It is claimed that the mines are no longer in the market and that about April 1st M. Blair will go to Silver Peak and begin work on the mines.

At Goiconda the railroad is bringing ores from the mines at the rate of ninety tons a day. The mill has started up and it was expected the furnaces would be sufficiently heated to begin the reduction of ore this week. The mill is lighted by electricity.

At Virginia the Comstock Pumping Association the past week finished the tank on the 1750 station. Retimbering the station was not finished as the foundation for the Risdon pump plant had to be built just below this station. Everything about the shaft and machinery is in good order.

The North Mountain Co. at Egan will start up again March 1st.

Last week a force was put to work in the Star mine putting in the air compressor to work the power drills. When completed a big force will be put to work in the mines.

The Glasgow & Western Co.'s mines will restart getting out ore early in February to be ready for the mill being built.

At the American Victor mine the shaft is 60 feet deep and the ledge is increasing in size.

Austin *Reveille*: J. F. Mitchell made the second payment on the New Pass mill and mining properties, near Austin, last week, and took charge of the same. The mine has several large bodies of ore uncovered, exposing enough to keep a 20-stamp mill in operation. The company contemplates erecting a quartz mill of fifteen or twenty stamps, and during the intervening time the present mill of about eight tons capacity every twenty-four hours will be kept running.

Pioche *Record*: A. Bybee of Chicago has purchased the Great Eastern and Vesuvius mining claims in Bristol mining district for $10,000. It is the intention to develop these properties and work is now going on.

NEW MEXICO.

In the Memphis claim in Bitter Creek, Red River district, a mill run across a 4-foot vein yielded $188 per ton.

At Mogollon the Confidence mine is working seventy men. The ore bodies in the mine are of large extent and good average grade. The main adit level has attained a length of 1700 feet. The electric hoist will soon be in place.——At Central the Texas shaft has attained a depth of 500 feet and is producing first-class shipping ore and a large body of concentrating ore. The mill is turning out a good grade of concentrates.——At the Chloride mines, near Silver City, fifteen men are taking out iron and lead ores which contain a fair value in silver.——The Rescue mine is being worked under lease and is getting out good ore.

Hillsboro *Advocate*: Four Mexican dry washers of the Hillsboro placers sold $435 worth of gold dust and nuggets last week, the result of five weeks' work.——A pocket containing $380 in gold was found last week in the Richmond mine, near Hillsboro, by Leasers Wayland and Zimmerman.——Robins & Crews bought $478 worth of gold dust and nuggets last week from Mexican dry washers. Keller & Co. bought $675 worth, one nugget therein being valued at $92.——Four sacks of ore from the Opportunity mine last week yielded $165. ——J. Smith shipped forty-three tons of ore from his Commonwealth mine.——A piece of ore weighing fifty pounds and containing $115 was taken from the Trippe mine last week.——Hopewell & Tomlinson made an ore shipment of twenty-seven tons from the Seventy-Nine mine.——E. Teaford shipped thirty tons of first-class ore from the Nancy Lee mine to the Charter Oak mill.——L. E. Nowers bought $178 worth of gold dust from A. Farrington, a Hillsboro placer worker.

Silver City *Enterprise*: The Silver City Reduction Works is running at its full capacity, the two smelter stacks running 135 tons of ore daily. It is locally stated that the capacity of the works will soon be largely increased and that a lead-smelting stack will also be added to the works.——W. H. Newcomb is shipping twenty tons of iron per day from his mines. ——Crawford & Derbyshire have contracted with the manager of the Hearst interests in the copper mines of Silver City, to concentrate the ore in the large dumps of the various properties which the estate controls. The capacity of the plant will be seventy-five tons of ore per day.——Ashton & Co. struck ore on the Montoya mine which yields 60 to 80% copper.

OREGON.

The Shorty-Hope M. Co. at Ashland are running their 10-stamp quartz mill day and night.

Barron & White of Spokane have let a contract to drive a 300-foot crosscut tunnel near Ashland at a depth of 200 feet below the surface. They expect to have the work finished in 100 days and began operations this week. This property is a dyke formation and one class of ore worked $45 per ton and another $15 per ton gold in milling tests. The ore was taken out at a depth of 80 feet.

Grant's Pass *Journal*: G. W. Woodcock of Woodville brought $175 in gold dust to Grant's Pass last week.——The Pickett Creek M. Co, have six men at work on their hydraulic piping plenty of water.——At Camp Jupiter a company is developing the F. Houston property. ——From the Hayes, Jewell & Moore placer on Oscar creek the result of only three days' piping one nugget worth $242 and some smaller ones, making in all over $500, were brought to Grant's Pass recently.—— The Jump-off-Joe M. Co. is running two giants night and day. An electric light has been installed.

Sumpter *News*: The Cornucopia mines near Sumpter are shipping monthly fifty tons of concentrates. These are half the amount shipped during the summer months.——The E. & E. mine shipped three carloads of ore to the Baker City sampling works.

Baker City *Republican*: The Bonanza mine near Baker City last week produced $35,000—the result of a seventeen-day cleanup—in four bricks weighing 2072½ ounces. ——Near Susanville the Badger M. Co., which has a bond on the Badger group of mines, has been pushing operations ever since the completion of its new quartz mill last fall. The best ore is shipped to the Baker City Sampling Works, while the second grade is being worked in its new mill. The ore contains a good per cent of free gold and the concentrates are shipped to the smelter.——Aimes & Simmons, who recently purchased a quartz property from W. C. Gibbs, have had day and night forces at work during the winter. They sunk a shaft 100 feet and will continue to 200 feet depth. Their ledge is of good width and grade.

SOUTH DAKOTA.

Last week from the Harrison mine near Lead forty tons of wolframite, valued at $200 per ton, was shipped to the Phœnixville Metallurgical Steel & Iron Works.

The Esmeralda mine, near Central City, is shipping ore to Deadwood that yields $50 per ton.

UTAH.

The Red Wing mine of Bingham shipped 200 tons of ore last week.——The Centennial-Eureka mine at Eureka recently shipped three cars of ore.

In Tintic district, in the Little Chief mine, a vein of quartz heavily impregnated with copper was encountered in the 150-foot shaft, assays thirty ounces in silver, $4.50 gold and 12% copper. The company will at once install a steam hoist and deepen the shaft.——In the 300-foot level in the Star Consolidated mine at Tintic a strike has just been made, samples from which indicate a heavy percentage in copper, with the usual amount of gold in that locality.

The Lower Mammoth at Tintic has encountered the main ore chute on the 400-foot level and hoisting of ore has begun. Assays from it show 12% copper, sixty-two ounces silver, from 12% to 60% lead and $1.80 in gold; 4 feet of ore is exposed.

At Bingham ore from the Julia Dean mine showed 123 ounces gold, 13% lead and 23 ounces silver per ton. From lower down in the stope the ore gave an average of 110 ounces silver, 60% lead and $3 gold.——The Martha Washington mine, at Tintic, has resumed work again. The company will introduce a pump and continue sinking to a depth of 600 feet, the ground to be prospected off intermediate levels and the work to be put forward with three eight-hour shifts. In the workings off the 350-foot level there is a showing of milling ore and a large body also at 420 feet. ——In the Triumph M. Co., embracing eight claims, at Silver City, the production of ore will be resumed soon. At 100 feet they encountered ore that yielded from 60 to 315 ounces silver, with 7% copper and 5% lead. The vein is 30 feet wide.

At Mercur, La Cigale mill is in successful operation. The roasters are not being used at present, as there is plenty of ore that will leach without being roasted, though the black ore will have to be calcined. The self-dumping tanks work well; they can be dumped and filled in twenty minutes. Twenty-eight zinc boxes are used and nearly 200 pounds of auro-cyanides are on hand. No cleanup and shipment has been made. The incline is down 850 feet. Twenty-five men are employed and 100 tons per day are being leached.

The Queen of Sheba of Deep Creek last week shipped gold bullion amounting to $1300. ——The International mine at West Tintic, while cutting out a station 200 feet from the

mouth of the tunnel, exposed 12 feet of milling ore. The ore shows $15 in lead, silver and gold. A mill has been decided on by the company.

R. C. Chambers tells a representative of the MINING AND SCIENTIFIC PRESS that the Ontario at Park City will start up next spring if silver's present price is maintained.

At Eureka the Tesora M. Co. has let a contract for a 200-foot shaft and ordered a steam hoist with a 1000-foot lifting capacity.——Supt. Earls is running a drift from the bottom of the 1800 foot shaft in the Mammoth mine to tap the ore body that gave good values on the level above. About 200 tons of first-class ore are being marketed.

The Red Wing of Bingham last week made a shipment of forty-five tons of concentrates. The previous consignment netted the company over $25 per ton. A shipment of high-grade crude ore was shipped this week.

The *Miner* reports consignments from Tintic last week to be seventy-three cars of ore. In addition to this, the Mammoth mill sent out three cars of concentrates and two bars of bullion.

Mercur *Mercury*: The No You Don't mine of Stockton, in a shaft 400 feet deep, last week opened a vein which shows 45% lead and 100 ounces silver. Shipments of high-grade ore will soon be resumed.——The Northern Light last week marketed two lots of ore. The first-class lot showed values of 449 ounces silver, 16% lead and $10 80 in gold and the second class contained 204 ounces silver, 7% lead and $4 in gold to the ton ——At the Hillside two drifts are being run at 465 feet depth in ore of a good milling variety.——The new ore body in the Eagle yields $5.60 and the averages are high enough to give a fair margin in treating.

Bingham *Bulletin*: The Bingham Copper & Gold Co. is preparing for extensive operations on the Commercial group. About fifteen men are employed, and the old lower workings will soon be all clear and retimbered. There are several hundred tons of ore on dump and in bins, mostly milling grade, but including a proportion of high-grade copper.——Last week the Spanish shipped eight carloads of galena.

Park *Record*: At Park City a lease and bond have been secured on the west half of the twenty patented claims comprising the West Ontario group. The ground consists of a block approximately 3000 feet square. Loofbourow & Co. secured the lease for two years for $40,000 ——The shipments of ore and concentrates from Park City the past week were 1,811,590 pounds.——Recent samples from the Superior mine showed 98 ounces silver, 64% lead and $1.03 in gold.

Salt Lake *Tribune*: The shareholders of the Daly-West M. Co. met in special session last Tuesday to ratify the terms of compromise upon which the factions have agreed. In doing so, they consent to an increase of the capital stock from 75,000 to 150,000 shares, and to an increase in the capitalization to $3,000,000, or double the present figure; 75,000 shares of the stock will be delivered to J. B. Haggin and others owning one-half interest.——The Mercur M. Co. has decided to refine its gold dust and will build a refinery.——In the Lulah Con. M. Co.'s ground at Diamond ore has been encountered that carries a good margin in copper, silver and lead, with some gold.

WASHINGTON.

The Gold Park M. Co. of Tacoma recently sold the Eagle mine near Liberty, Kittitas county, to a New York corporation for $45,000. A 10-stamp mill with a capacity of fifty tons is included in the sale. The ore is free milling running from $15 to $35 per ton.

Work will be resumed soon on the Trail & Tenderfoot. The property has had considerable work done on it. There are several hundred feet of tunnel and some surface work. There is a large body of quartz that runs from $5 to $8 per ton gold.——At Nelson, J. Fox on the Echo claim, from across a 6-foot ledge, is taking out ore that assays from $22 to $56 per ton in gold and copper, with two to five ounces in silver.

At Republic from the Mountain Lion mine 7 feet of the ore body is being taken out, and it yields $70 per ton. There is not a pound of waste. An air compressor plant will be put in.——In the El Caliph there are 2 feet of ore in the shaft which averages $31 in gold per ton. Fifty feet of stripping has been done, showing a good ledge the entire distance.——The tunnel being driven on the Morning Glory struck a ledge 5 feet in width. An average assay across the ledge gives $67.17.

The Spokane *Electrician* says that the La Fleur-Comstock group of claims near Nelson was sold to the B. A. C. Co. for $32,500.

WYOMING.

In Grand Encampment district Boyce & Prosser have struck a 2-foot vein of high-grade grey copper ore. They are going down on the lead.

The Union Pacific Railway coal mining department had an average of 2166 men employed every day of '98 in its mines in Wyoming. The operation of that one department furnishes labor and support for 15,000 persons.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The War Eagle shaft, over which is a steel gallows frame over 100 feet high, is being fitted up with an electric hoist, which is probably as powerful and capable of as rapid work as any in existence of that kind. At the same time an electrically operated air compressor is being installed, under the same roof, capable of operating forty drills. The power for hoist and compressor is transmitted from the electric plant of the West Kootenay Light and Power Co., thirty-one miles away.

The Iron Mask, owned by D. C. Corbin, Austin Corbin, E. J. Roberts, J. F. Herrick, H. M. Richards, A. T. Herrick and others of Spokane, is under the superintendence of S. W. Hall, formerly of Butte. It has an output of ore of from 250 to 400 tons per month. The ores are a copper pyrite, with sulphides of copper and calcite. The vein structure is a replacement along lines of small fissures. The values run about $30 gold, 2.2% copper, net from the smelter. The underground workings comprise about 4700 feet of tunnels, drifts, winzes and raises. The main tunnel passes from the east end line through the claim, 1353 feet in length. This tunnel is used in common by the Iron Mask and War Eagle companies. From the tunnel level winzes sink on the vein. A 12 drill compressor is being put in. It is a belted machine, run from a motor by a counter shaft.

The Le Roi group has a compound condensing compressor, 22x34x48 air and 22x40x48 steam, which is now operating thirty drills and is capable of operating forty. The main shaft is 800 feet deep and has a 20x42 direct-acting hoisting engine. From the shaft there are drifts at 100-foot stations.

The Virginia Mining Co. are developing their property north of town. A shaft sinks 500 feet to get the vein. Some ore has been encountered.

The Lode Star G. M. & D. Co. of Rossland are developing five claims on Duncan river, in the northern part of the province. In this locality the ores carry gold, silver, lead and copper. Samples from these claims are said to run 53 to 100 ounces silver, $18 gold, 40% lead and 21% copper.

Rossland, B. C., Jan. 20th, '99.

(Special Correspondence).—Greenwood camp is attracting great attention by reason of the discovery, development and product of the properties known as the Ironsides and Knob Hill, which are on the same ledge and controlled by the same parties, though forming separate corporations. This camp is near Boundary creek, about ten miles north of Midway, and is one of the main points on the new branch of the Canadian Pacific railroad, being extended from Robson to Penticton via Cascades and Grand Forks.

On the Ironsides there is a shaft 200 feet deep. At the 100-foot level a crosscut drift has been driven 108 feet, 60 feet of which is in ore, the drift being across the vein toward the hanging wall. At the 200-foot level a second crosscut was driven 282 feet, 130 feet of which was through a ledge of ore. Samples of every car of ore taken out were tested, resulting in values of from $12 to $40 per ton in gold and silver.

On the Knob Hill a crosscut tunnel, not at right angles to the wall, was driven 382 feet, the last 172 feet of which was in ore. Samples from every car of this gave about $10 gold, three ounces silver and 6% copper. In one particular section of high grade ore, 30 feet wide, which was encountered, there was an average value of $48 gold. The owners of these properties are residents of Toronto, New York, Boston, Philadelphia and Spokane. It is announced that they will put up a smelter on the ground.

The ores are a species of chalcopyrite, carrying gold and silver. It was on the report of N. E. Lindsley of Spokane that the present owners took hold of the Ironsides and Knob Hill.

Greenwood, Jan. 15th, '99.

At Ymir the new 40-stamp mill at the Ymir mine is in operation. The Ymir mill is said to be the largest one in operation in British Columbia.——The 50-ton concentrator of the Dundee mine started recently.

The Last Chance mine in the Slocan shipped 840 tons of ore since July 1st, '98. The mill is sending twenty tons per day over the tram.——A carload of ore has been shipped to the Selby smelter, San Francisco, from the Sapphire. The ore runs 160 ounces silver and 70% lead. Regular shipments will be made.——Forty thousand dollars has been spent this year by the Minnesota Silver Co. on its Slocan properties. Further expenditures are contemplated to the amount of $60,000 for tramway and concentrator.

CHINA.

A Peking dispatch says that a mining concession has been signed. It is understood that the contract secures for W. P. Morgan of Wales, in partnership with an American syndicate and the Chinese authorities, control of all the mines and oil fields in the province, the Americans providing 25% of the capital, the Chinese officials 30% and Morgan the remainder. He, it is asserted, intends to start with a capital of £1,000,000 and proposes to administrate Szechuen on the same lines as followed by Cecil Rhodes in South Africa.

MEXICO.

The La Descubedora mine near Chihuahua is shipping fifty tons of ore per day.

Near Chihuahua the El Socorro M. Co. is producing a high-grade ore—silver and gold.

The gold mine of Kraft & Anderson near Chihuahua is one of the most regular and heavy shippers in the State of Chihuahua. The ore goes to the works at the rate of 100 tons per day. It is manganese oxide and carries a very uniform value in gold.——The mines near the Laguna de Guemes are presenting good results. The Bismarck produces 125 to 150 tons of very fair grade ore a month, and the Australia is working on some rich veins.

The Bismarck mines near Guzman and the Aventurera group near Sabinal are owned by the Juarez Co. The Bismarck ores run from 12 to 15 ounces silver, 20% lead and enough iron to make them excellent for fluxing. The Aventurera ores carry twelve to fourteen ounces of silver, half an ounce of gold, 10% of lead and iron. They are shipping sixty tons from the Aventurera and fifteen tons from the Bismarck daily to Sabinal. The ores go over the Sierra Madre line to Ciudad Juarez, where the Juarez Co. has reduction works employing 300 men.

ONTARIO.

At Mine Center the last cleanup of the Golden Star mine is said to have run over $16,000. The mill is a 10-stamp of two and one-half tons capacity per day. The shaft is down over 400 feet.

THE PHILIPPINES.

The following is reproduced from a recent issue of the *American Soldier*, published at Manila. Its statements may be so, but are not considered reliable: "A party of Minnesota men have just returned from an eight-day prospecting tour into the country. Their names are Sergeants Hemphill & Corrie and Privates Manning, Bowe, Newton, Handscome, Weisse, Upson and Mitchell. Some time ago Newton learned that there was considerable gold in the interior mountain streams. He obtained a sample from a wandering mountaineer and also the information that there was plenty more to be found. Therefore, with permission of Major Diggles, Newton organized the above mentioned party and set out for a jaunt through the insurgent territory. The party went up the Pasig river to its terminus in a native casco, and continued the rest of the way on foot. They thoroughly prospected the San Juan and Monte Blanc mountains, fifty miles distant from the American lines. They found the natives inclined to be friendly but very curious. The mountain streams are very swift, the water is clear and cold; as a rule they are quite shallow, and many species of fish live in them. All of them find their way into the Pasig. In all of these streams that the party prospected save one, evidences of gold were found and one or two of the streams showed good yields. The natives have wooden long-toms and manage to wash out about a tablespoonful of gold a day, for which the insurgents pay them two Mexican dollars, when in reality that amount of gold is worth somewhere in the neighborhood of $85, American. Up the streams, farther than the insurgents allowed the boys to go, there must be some very rich drifts. The men who strike one of these will be staked for life. There was one stream discovered that promised to be a regular Eldorado. The boys followed it some time. Dust and nuggets were panned out. The signs grew richer as they advanced, but as luck would have it a party of insurgent soldiers ordered them not to ascend the river any farther, offering as a reason for the order that they feared the mountaineers would attack them and the Americans would hold the insurgent government responsible for their lives. This was not the true reason, however, as the boys learned later from a native, that farther up the river Aguinaldo had a supply house and the insurgents feared the Americans were desirous of locating it."

Personal.

P. M. MCCREE is Supt. Commercial mine, Bingham, Utah.

G. H. GILES is Supt. Copper Queen mine, Basin, Montana.

M. HANLEY has been appointed Supt. Ibex mine, Leadville, Colo.

F. B. HILL, Supt. Oriental mine, Alleghany, Cal., is in San Francisco.

F. J. MARTIN, Supt. Fortuna mine, Fortuna, Ariz., is in San Francisco.

F. C. INNES of Spokane, Wash., is building a 5-stamp mill in Butte Co., Cal.

N. M. BRADBURY succeeds O. Jones as Supt. North Fork gravel mines, Forest, Cal.

A. T. EAGAR, formerly Supt. Occidental and Utah mines, Virginia, Nev., has gone to Mexico.

D. J. MOORE, Supt. Culbertson mine, Graniteville, Cal., has returned from San Francisco.

M. W. MATHER, Supt. Plumbago mine, Alleghany, Cal., has returned from San Francisco.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., has returned to the mine from San Francisco.

DANIEL JUTTON, formerly Supt. Royal mine, has gone to Shasta county, Cal., to examine some mining property for foreign capitalists.

DR. A. SCHEIDEL, now operating in Victoria, N. S. W., has bought some mining property at Ballarat, for which a $50,000 working capital is to be provided.

SAMUEL WHARTON, who was recently in Spokane, Wash., is building a 40-stamp concentration mill on the old Dahlonega gold mine near Dahlonega, Georgia.

ROBERT G. WELLS, connected with the Nicopol-Maripol Mining & Metallurgical Co. of Maripol, Russia, has placed orders for machinery aggregating $1,000,000 for plants at Maripol.

JAMES B. SOVEREIGN has resigned as editor of the organ of the Western Federation of Miners, because the Populist State Senators combined with the Republicans in Idaho to organize the State Senate.

W. A. CLARK, a miner, elected last week to the U. S. Senate from Montana by questionable methods, will be the richest man in that body, and, in a few years time, may be the richest man in the United States, if not in the world.

JOHN S. CAREY, manager of the Mine & Smelter Supply Co. of Denver, Colo., was recently in Salt Lake City and purchased the stock and business of the Utah & Montana Machinery Co. at the latter place, and will operate the business as a branch of the Mine & Smelter Supply Co.

Recent Mining Incorporations.

Blue Gravel M. & M. Co., San Francisco; capital stock $40,000, subscribed $35,000; E. A. Moody, A. H. Bangs, G. E. Beach, J. T. Newell, M. J. Kern.

Mach Con. G. M. Co., San Francisco; capital stock $200,000, subscribed $600; J. A. Chanslor, R. Spreckels, W. Wayte, J. Cross, E. Hirschler.

Experimental M. Co., San Jose; capital stock $300,000, subscribed $200,000; W. Crites, C. E. Hailstone, F. W. Graham, W. J. Graham, W. F. Phillips.

Industrial Notes.

—The Sierra railway is to be finished to Sonora, Cal., February 20th.

—The Santa Ana & Newport, Cal., railway, twenty-two miles long, has been sold to J. R. Clark for $500,000.

—British Columbia imported over 500 more Chinamen in '98 than in '97. That is the class of labor 3000 coal miners of Washington compete with.

—The Oregon Railroad & Navigation Co.'s statement for the six months ending Dec. 31st shows: gross earnings, $3,858,467; operating expenses, $2,193,018.

—Nine horseless carriages are to be operated by the Santa Fe road between Flagstaff, Ariz., and the Grand canyon—three to cost $4000 each, six $1500 each.

Senator Perkins writes that the Government has during the past year made purchases amounting to $10,000,000 in California and other Pacific coast States.

—St. Petersburg discovers that the greater part of the trade of north Siberia is going to the United States. The whole of the Tschu Kshi peninsula is in economical dependence on Americans, who own the neighboring island of St. Lawrence in Bering sea.

—About 3000 tons of steel rails have been bought at New York for immediate shipment to the Nevada, California & Oregon railway at Reno, Nev. At present the railroad extends from Reno to Amadee, Cal., eighty miles. It is proposed to run the line to Susanville, Cal.

—The amount of insurance written on the Pacific coast in '98 was $656,057,065; the amount of premiums was $10,793,558, an increase over '97 in the former total of $160,000,000 and in the latter of $2,400,000. The coast losses amounted to $5,638,021 last year and to $4,040,541 in '97.

—It is again asserted with great positiveness that preparations are afoot for the transfer to a big continental railway company of the San Francisco & North Pacific Railroad, which runs from Ukiah southward to Point Tiburon, Cal., and thence has ferry connections across the bay to San Francisco.

—Current has been turned on from the new electric power plant of the Dexter M. Co., eighteen miles from Tuscarora, Nevada. The water of a neighboring stream is brought around the mountain in an open flume to Chicken creek, where it empties into a steel pipe 3000 feet long and is conveyed to the power house under a pressure of nearly 400 feet. It is estimated that 900 H. P. can be developed at the wheel under a full head, sufficent to run forty stamps besides the hoist, pumps, compressors and lights for the town.

—In his annual report on the commerce and industries of Mexico, United States Consul-General Barlow has this to say of the general high standing of the merchants of that country: "The business conditions of Mexico are noteworthy, and it will be of much pecuniary benefit to our merchants to study them. In the first place, there are very few concerns doing business here that have not ample credit to carry out all the contracts into which they may enter. Failures are very rare indeed, and, when they do occur, are carefully investigated by the authorities in the interests of creditors, and any attempts to defraud are severely punished. Book entries are regarded as sacred; all books kept by business houses are known and small stamp taxes paid on them, and thus a sort of surveillance is kept over them by Government authorities. All this tends to keep up a high standard of commercial credit."

—Capt. A. S. Crowninshield, writing in the January *Century* of the "Advantages of the Nicaragua Canal," says: When the divide between the Atlantic and the Pacific is cut through part of the waters of the lake, which for untold ages have flowed east to the Caribbean sea, will flow west to the Pacific. Lake Nicaragua, covering, as it does, nearly 3000 square miles, becomes not only a part of the water route itself, but a grand reservoir, located exactly where it is most needed—at the summit level. Thus it will be seen that while nature has not quite opened through Nicaragua a complete water route to the Pacific, she has come very near to it. In fact, of all the routes for an interoceanic canal that have received consideration it must be admitted that so much has already been accomplished by nature toward this end that the work which remains for man to do will be far less than by any other route.

—Manila hemp is a commercial success only when raised in the Philippines. It is one of the chief resources of the islands, and for ten years this country has taken an average of 41% of the total exports. From the bast, or fibrous outer leaf, comes the coarse, strong fiber, which is the best material used for sailcloths and cordage. It is particularly recommended by the fact that it is not easily rotted by salt water. The fiber yielded by the inner stalks is fine and weak, and from it are woven textile fabrics superior in softness and lightness to those made of the best Russian hemp. These fabrics are seldom exported, being bought by Chinese merchants at Manila for local consumption. This useful variety of the banana plant, accordingly, yields two qualities of fiber, the one strong and coarse and the other fine, soft and pliable, and both are in great demand. Manila hemp produces, under the best conditions, as high as 3000 pounds of fiber to the acre, and, though 6,528,964 bales have been exported in the last ten years, the industry is still in its infancy and is capable of enormous expansion. Its development, like all things under Spanish colonial rule, has been spasmodic and unsystematic. A recent writer on the Philippines says that, under proper encouragement, the Orient itself would absorb more than the entire present product. The world's markets will take several fold the quantities of fiber that is now supplied.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JANUARY 24, 1899.

618,317.—PIE-RACK—E. V. Anderson, Van, Or.
618,264.—BED LOUNGEBOX—W. H. Burtless, Sacramento, Cal.
618,377.—MINER'S PICK—E. Daly, Monterey, Cal.
618,266.—WORKING FROZEN EARTH—B. F. Gilman, S. F.
618,348.—LINOTYPE MACHINE—J. D. Harvey, S. F.
618,098.—WEEDER—L. P. Hopkins, Rosedale, Cal.
618,295.—PADDLE WHEEL—R. Schlegel, S. F.
618,298.—STATION INDICATOR—R. Sperber, Seattle, Wash.
618,143.—DREDGER—A. Thompson, Tacoma, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BED LOUNGE BOX ATTACHMENT.—W. H. Burtless, Sacramento, Cal. No. 618,264. Dated Jan. 24, 1899. This invention relates to improvements in bed lounges. The object is to provide a convenient containing attachment for holding bed clothing, pillows and like articles, and so connecting it that it can be withdrawn from the lounge for the purpose of removing or replacing articles, and then closed in beneath the lounge so as to form a support for one of its angles. The lounge has a full support at the head and a single leg at the rear of the opposite end. This leg serves as a swivel post for the box, which has a hole made through the bottom and fitting the leg so that the box can be turned about the post. The other angles of the box have casters so that it will turn freely. In its normal position it swings about the swivel post and stands beneath the lounge, where its contents are entirely concealed, and its front angle serves as a support for the front lower end of the lounge, which has no leg. When the box is swung out, it is entirely open and exposed, so that articles can be conveniently packed in it and removed therefrom.

LINOTYPE OR LINE CASTING MACHINE.—John D. Harvey, San Francisco, Cal. No. 618,348. Dated Jan. 24, 1899. This invention relates to improvements in linotype or line casting machines, in which lines of matrices are assembled and the metal afterwards cast to form a complete line of type. The object of the invention is to enable the compositor especially to introduce italics, or other desired characters, into the line of type, without multiplying the line of matrices now in use. To do this the matrices are formed with two lines of letters or characters upon the edges, and by the use of suitable mechanism any number of matrices may be raised to form the italic or other line, and after the casting has been done they may be again returned to their normal position so as to be in form for distribution.

PADDLE WHEEL.—R. Schiegel, San Francisco, Cal., one-half assigned to John Bauman, same place. No. 618,295. Dated Jan. 24, 1899. This invention relates to that class of wheels used in connection with the propulsion of vessels which are known as "feathering paddle wheels" in which the blades or floats are made to dip into the water and pass through the ark of rotation while they are in the water without changing their essentially vertical position so that the beating upon the water when blades of the usual construction enter, and the lifting or dragging when they leave the water, is avoided. The invention consists essentially in the novel arrangement of disks mounted upon the main and upon supplemental shafts out of line with each other, journal pins on the peripheries of the disks, and floats or blades so connected that the journal pins have to be maintained in essentially the same plane during the revolution of the wheel, said blades being also so constructed as to dip into the water without the necessity of submerging the wheel rims so as to create frictional resistance to the revolution.

APPARATUS FOR WORKING FROZEN EARTH.—B. F. Gilman, San Francisco, Cal. No. 618,266. Dated Jan. 24, 1899. This invention relates to an apparatus which is especially useful in regions where the winter temperature is so severe that the ground becomes frozen to a very great depth, and does not thaw out during the short summer months sufficiently to allow it to be worked. This invention is designed to soften this frozen earth so that it can be excavated. It consists essentially of a furnace with heating passages or chambers, a means for forcing air through the furnace so that it may be heated to a high temperature, means for directing the heated air upon enclosed surfaces of the frozen ground so that the latter may be thawed and softened sufficiently to be afterwards excavated. The heated air delivered from the furnace is conveyed to a flexible or jointed pipe to a nozzle through which it may be discharged against the surface of the ground, or within the shaft to be worked, and in order to contain the utmost value for the heat it is preferable to enclose the ground which is being worked to prevent the escape. This may be by means of a surrounding structure, or in case of a shaft or tunnel, of sufficient depth by closing the mouth thereof.

Commercial Paragraphs.

THE Jeffrey Manufacturing Company of Columbus, Ohio, which has recently taken up the manufacture of standard elevator buckets and spiral conveyors, reports a very flattering trade. Its facilities are such as enables it to supply high-grade material at prices which secures for it a large trade for this class of machinery. Any one requiring material in this line will do well to secure the Jeffrey Company's latest catalogue and prices, which will be cheerfully sent upon application.

THE Pelton Water Wheel Co. have recently signed a contract for the hydraulic work of an important electric power transmission plant, to be installed near the city of Puebla in Mexico. The contract calls for two 1200 H. P. wheels with governing apparatus, receiver, pipe line and all accessories for a complete plant. The pipe line is 2600 feet in length, 40 inches in diameter, made of steel plates from 5/8 to 7-16 inch in thickness, according to pressure sustained at various points on the line. The weight of the entire equipment is some 600,000 pounds. The power from this station is to be transmitted seven miles to the city of Puebla, and is to be used for lighting and general power purposes. The electrical equipment is furnished by the foreign department of the General Electric Co. This city is one of the most important manufacturing centers in Mexico, having a large number of cotton and jute mills, flour and sugar mills, as well as various other industries, and it is largely to promote these industries that this installation is projected.

Recently Declared Mining Dividends.

Deer Trail No. 2, Washington, $2500; payable immediately.

Gold Coin, Colorado, 1 cent per share, $10,000; Jan. 25.

Utah mine, Utah, 2 cents per share, $2000; Jan. 24.

La Reina mine, Mexico, $150 per share, $28,000; payable immediately.

Boston & Montana Copper Co., $4 per share and $1 per share extra, $750,000; payable Feb. 20.

Sacramento, Utah, 1/8 cent per share, $5000; Feb. 1.

Bunker Hill & Sullivan M. & C. Co., Idaho, $21,000; Feb. 4.

Morning Star, California, $4 per share; payable immediately.

WANTED — POSITION WITH MINING COMPANY.
Chemist, Assayer, Cyanide Process, Surveying, Experienced Machinist and Engineer.
Address A. P., this office.

PRACTICAL ASSAYER
WANTS POSITION. Many years experience in mill work in wet and dry mills, and in gold and silver amalgamation. Address J. C., Assayer, Mining and Scientific Press Office.

WANTED.
Capital to Handle Extensive Gold Mines.
JAMES ARTHUR, Cornucopia, Oregon.

WANTED.
Position as Superintendent or Assistant Superintendent of Copper Mining and Smelting Works.
Competent Smelter, Assayer, etc. Understands handling men; speaks Spanish; willing to go to Mexico or South America; best references. Address COPPER, this office.

Tunnel Contract.
BIDS WANTED TO RUN A MINING TUNNEL, 1500 feet long, in the State of Durango, Mexico. For particulars, address H. M., this office.

ENGINEERS!
An Improved Tabor Steam Engine Indicator
In a neat black walnut box and in first-class condition, for sale at a bargain.
Address H. R. JONES, SELBY, CALIFORNIA.

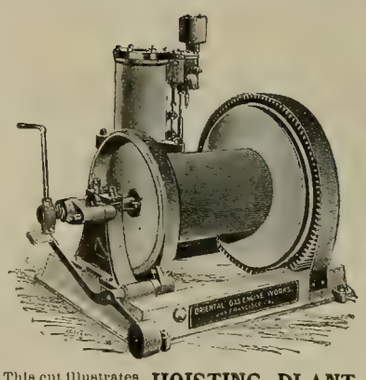
DIAMOND DRILL FOR SALE,
OR CAN BE HIRED, TOGETHER WITH EXPERT TO OPERATE IT.
Apply to J. A. MURRAY, care of Risdon Iron Works, San Francisco.

W.&P. BUILDING PAPER. Insulating. Water proof. Sanitary. Vermin proof.
Tarred Felts, Roof Paints, Boiler & Stack Paints.
PACIFIC REFINING & ROOFING CO.
113 New Montgomery St., S. F.
Correspondence solicited.

TUBBS CORDAGE CO.
(A CORPORATION.)
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. Extra sizes and lengths made to order on short notice
611 and 613 Front St., San Francisco, Cal.

MICHIGAN COLLEGE OF MINES.
Supported by the State of Michigan. Practical work. Elective system. Special advantages for men of age and experience. For catalogues address
DR. M. E. WADSWORTH, President,
Houghton, Michigan.

"CRACK PROOF" GOODYEAR RUBBER CO. (COLD SEAL 1872 TRADE MARK)
PURE RUBBER BOOTS
Are the CHEAPEST because
They Are the Most Durable.
Beware of Imitations.
GOLD SEAL, BADGER AND PIONEER Belting, Packing and Hose.
RUBBER FACTORY IN SAN FRANCISCO.
Valves, Gaskets, Etc., Made to Order.
GOODYEAR RUBBER CO.
R. H. PEASE, Vice-Pres't and Manager,
Nos. 573, 575, 577, 579 MARKET ST., San Francisco.
Nos. 73, 75 FIRST ST., Portland, Or.



This cut illustrates our 4 H. P. to 8 H. P. **HOISTING PLANT.**
Larger sizes built to suit the demands of our customers.
It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake. No better device has been designed for this purpose. For prices and further information address the builders.
Oriental Gas Engine Co., 105 Beale St., S. F.

THE JEFFREY MFG. CO., Columbus, Ohio.
Send for Catalogue. 41 Dey Street, New York.
Western Branch, No. 521 17th St., Denver, Colo.,
F. R. FIELD, Representative.

Thousands of engineers can testify to their efficiency. We want your endorsement also. Buy a Lubricator from your jobber. We guarantee it to give perfect service or money refunded. Jobbers on Pacific coast sell them.
The Wm. Powell Co.,
Cincinnati, Ohio.

PACIFIC EXPLORATION COMPANY
Finds buyers or working capital for meritorious mines or good prospects. Correspondence invited.
W. E. Holbrook, Pres't. L. F. Haskell, Sec'y.
28-30 Chronicle Building, S. F.

HEALD'S
BUSINESS COLLEGE.
24 Post Street, - - - San Francisco.
MINING AND CIVIL ENGINEERING DEPARTMENT: Mathematics, Draughting, Strength of Material, Chemistry, Assaying, Blow-Pipe Analysis, Geology, Mineralogy, Surveying, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation.
ELECTRICAL DEPARTMENT: Theory and Practice; Construction.
BUSINESS: Bookkeeping, Shorthand, Typing, Modern Languages, etc.
Twenty teachers; individual instruction; can enter at any time; Catalogue and Journal free.

The State Ore Sampling Co.
DENVER, COLO.
We buy Gold, Silver, Lead, Copper, Bismuth, Uranium, Wolfram, Cobalt and Antimony Ores. With modern mills and machinery our facilities for sampling ores are the best.
Our long experience in the market enables us to obtain the highest prices for all marketable ores. Write for our "Reference Book." Send analysis of your ore for prices and information.
BAILY & MONNIG, Managers.

CALIFORNIA STUMP PULLER.

The Most Powerful Made!
Send for Illustrated Catalogue.
A. BARNES, Mgr., 16-18 Zoe St., San Francisco.

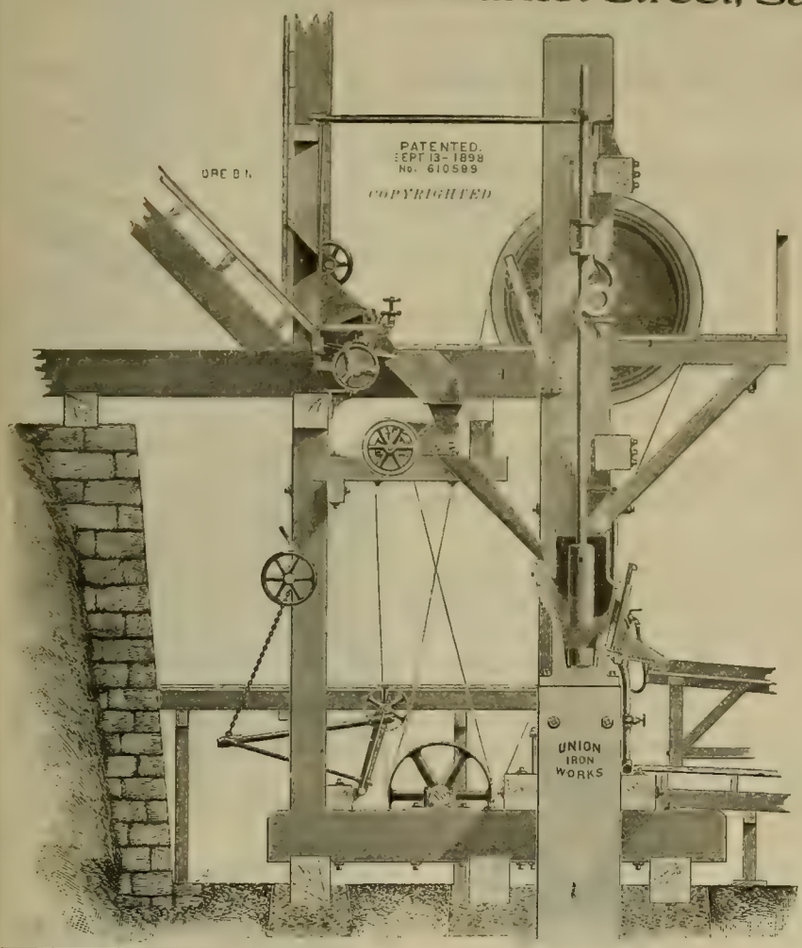
QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., 145 and 147 Beale St. S. F.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.
Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.
DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

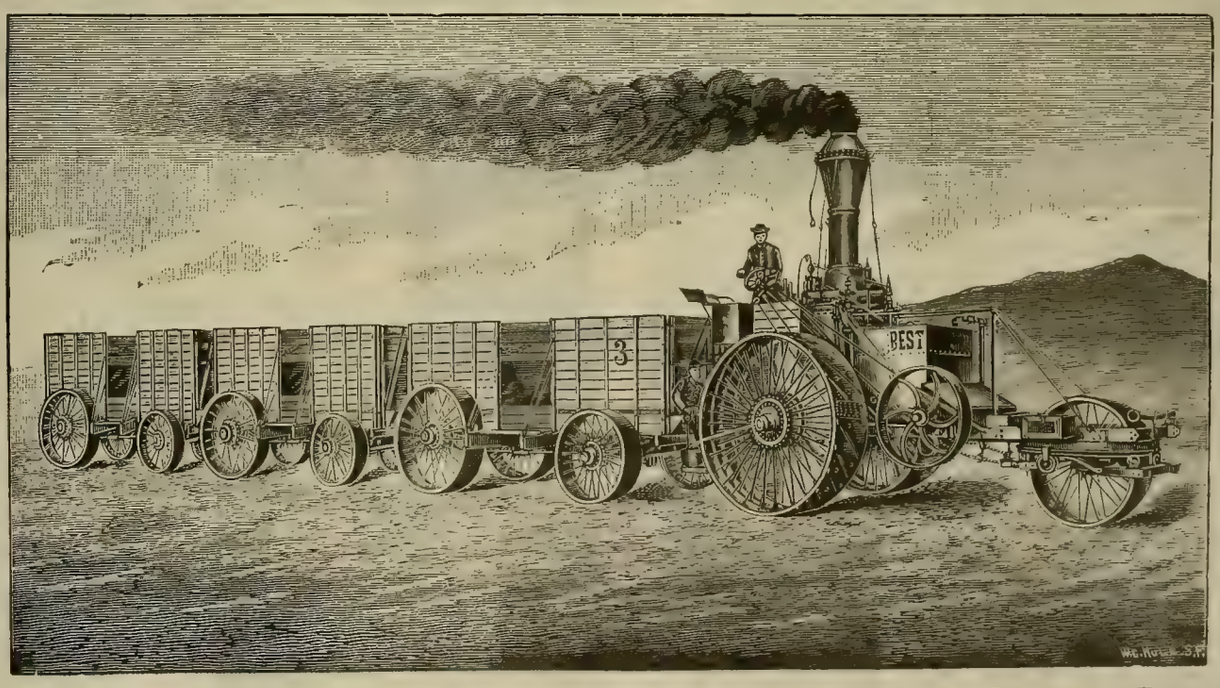
We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

A REVOLUTION IN FREIGHTING.



THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Log Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO., SAN LEANDRO, CAL., U. S. A.

Professional Cards.

A. H. RICKETTS,
Attorney at Law.
(Mining Law.)
Claus Spreckels Building.....San Francisco.

WADE & WADE,
Analytical Chemists and Assayers,
115½ N. Main St., Los Angeles, Cal.

D. B. HUNTLEY,
Mining Engineer and Metallurgist,
De Lamar, Owyhee Co., Idaho.

BERNARD MACDONALD,
Consulting Mining Engineer,
180 ST. JAMES ST., MONTREAL, CANADA.
Codes: Bedford McNeills and Moreing & Neills.

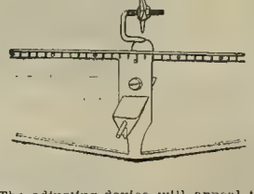
No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.



The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

Wm. Ainsworth & Sons,
(Successors to WM. AINSWORTH.) DENVER, COLO., U. S. A.

THE RISDON HAMMERED SHOES AND DIES

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

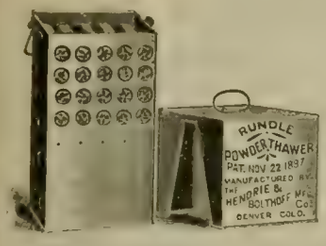
THE RISDON IRON WORKS, SAN FRANCISCO.

No 15.

Don't Take Chances!

PROVIDE YOUR MINERS WITH A

RUNDLE POWDER THAWER.



A convenient and absolutely safe device for thawing high explosives. Zero weather means an increased loss of life from carelessness in thawing Giant Powder. Don't let it be on your properties.

Harry A. Lee, Commissioner of Mines, State of Colorado, says of the RUNDLE POWDER THAWER: "It reduces the risk incurred in thawing frozen powder to a minimum, and its universal use in accordance with your instructions would save the lives of many miners annually."

Manufactured by THE HENDRIE & BOLTHOFF M'F'G & SUPPLY CO.,

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

DOUBLE CYLINDER SINGLE DRUM HOIST.

MINING AND MILLING MACHINERY.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark

Our German drawing instruments bear only the trade marks or

We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Paragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 2, 1899.

SILVER.—London, 27¼d: New York, 59¼; San Francisco, 59¼; Mexican Dollars, 47½@48. New York exchange, sight, 17½; telegraphic, 20 cents premium.

LEAD.—Still on the rise: New York reports "strong" $4.65 bid, $4.75 asked. The firm naming the selling price for leading miners and smelters at the West quotes Lead at $4.60.

Local, pipe, 6@6¼c; sheet, 6½@7c; pig, 5¼c; bar, 6c.

COPPER.—Continues to advance: New York reports Lake "strong and higher," $17 old, $17.25 asked. Local, bar 20c per lb.

Boston says: The street is having lots of fun out of the new copper companies. They are not called "cats" or "dogs," but "rabbits," some of them "jack rabbits" and some of them just "rabbits," the brokers say, because they multiply so rapidly. Some of the more recent ones are classed under the heading of white mice. The active head of one of the big copper companies smiles sarcastically and denominates the new copper promotions as jackpots, because, he says, it takes two knaves to open one. But it is just these rabbits, white mice and jackpots that are liable to make the price of copper in the future, not this year or next; but some of them have chances of becoming great mines with good management. For twenty years the bane of the copper market has been the small copper producer who offered his 100,000 pounds of copper all over the world with such importance as to break the copper market without effecting a sale.

IRON.—American, soft, $21.75 and $23.75 per ton; Scotch, $24.25. Local, bar, 2¼c per lb.

SPELTER.—3c.

TIN.—Pig, 20c per lb.: Bar, 25c. New York reports further advance, $25 bid: $25.25 asked.

ANTIMONY.—15.

BABBITT METAL.—No. 3, 7½c.

QUICKSILVER.—Unchanged. Local, $42: export, $38.50@39.00: carload lots, special rates.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¼c: less than one ton, 17¼c. No. 1* 60%, carload lots, 13½c: less than one ton, 15¼c. No. 1** 50%, carload lots, 11¼c: less than one ton, 13½c. No. 2, 40%, carload lots, 10c: less than one ton, 12c. No. 2* 35%, carload lots, 9¼c: less than one ton, 11¼c. No. 2** 30%, carload lots, 9c: less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, $1.50 per keg: less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, bd	14 50	Welsh Anthracite	12 50
Scotch	8 00	Rock Springs	7 00

COKE.—Foreign, $13: domestic, $12 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 30@31c per lb.; carloads, 29c; in 10-lb. tins 37c; sulphuric acid, 2¼c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2¾c per lb.; blue vitriol, 4¼c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9½@10c; roll sulphur, 2¼c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10@2.25c; saltpeter, 15c; chlorate of potash, 25c; caustic potash, 12c.

OILS.—California Castor, pure, cs., $1.08 per gal.; bbl., $1.03; pure No. 2, cs., 55c; bbl., 50c; Bazer's AA Castor Oil, in case lots of 200 gals. and upward, $1.15; less than 200 gals., $1.10; in bbls., 4c per gal. less than case: Baker's Crystal, $1.40; China Nut, 50c: Linseed, strictly pure, boiled, bbl., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; lots of 5 bbls., 1c less. Lucol, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 17¼c; Astral, 17½c; Star, 17½c; Eocene, 19¼c; Extra Star, 21½c; Elaine, 22½c; Water White, bulk, in tanks, 11¼c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 29c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 13c; do., cs., 19c; 86 deg. Gasoline, bulk, 20c; do., cs., 25c; 62 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 11½c; do., in cs., 16½c; Lard Oil, Extra Winter Strained, bbl., 56c; cs., 61c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 55c; cs., 60c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

CANDLES.—Electric Light Candles—6s, 16 oz., 7½c; 6s, 14 oz., 6¾c; 6s, 12 oz., 5¾c; 6s, 10 oz., 4¾c; Granite Mining Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 7¼c; 6s, 10 oz., 6¾c. Paraffine Wax Candles—1s, 2s, 4s, 6, 12s, white, 8c; colored, 9c.

NAILS.—List per keg: No. 20 to 60d, wire, $2.40: cut, $2.25: 10 to 20d, wire, $2.45: cut, $2.30; 8d, wire, $2.50; cut, $2.35; 6 and 7d, wire, $2.60; cut, $2.45; 4 and 5d, wire, $2.70: cut, $2.55; 3d, wire, $2.85; cut, $2.70; 2d, wire, $3.10; cut, $2.95. In carload lots, 10c per keg less.

San Francisco Stock Board Sales.

SAN FRANCISCO, Feb. 2, 1899.

The dullness was dispelled to-day by a little activity and a spurt in prices, though, as compared with its former self, or with the volume of business elsewhere, there is very little done, in marked contrast to the present tremendous activity in New York and Boston stock exchanges. Writing from New York, a member says:

"There used to be a time when $2 brokers would follow you around the room in the hope of getting an order. They have now become haughty persons, who take orders for their friends only, and as a matter of personal favor. The specialists feel bound, as a matter of consistency, to take orders still, but they show you the orders on their books and tell you that no human being knows at what figure your order will be executed. The floor brokers of active houses are beginning to look a little like pedestrians in a six-day walking match. They have to answer calls from the office, but the language which they use is painful.

"Trading is taking a new form. We used to suppose that when one stock started up it was well to grab the one nearest at hand, under the belief that it would follow suit. If any pronounced activity occurred everybody went to that crowd and dealt in that stock, while the activity lasted. Now the crowds are comparatively small, because there are so many places where there is activity. Stocks go up two or three points and traders 40 feet away do not know of the advance. Everything has become so large as to become incomprehensible for purposes of quick trading. You hear that somebody has bought or sold 20,000 shares, but it has no effect outside of the stock to which this trading occurred.

The traders who have made the most money lately have been those who bought as much as they could afford to purchase and then sat still and watched their profits increase. Here, again, profits have been much smaller than they ought to have been, because, judging always by the past, we have not been able to stand prosperity."

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1899, an assessment (No. 12) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 257 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—257 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 3 P. M. at his business office, 225 Sansome street.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of January, 1899, an assessment (No. 30) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 21st day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

MARINA MARSICANO GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of January, 1899, an assessment (No. 17) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1899, an assessment (No. 115) of Twenty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on TUESDAY, the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Forest Hill.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1899, an assessment (No. 16) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of February, 1899, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 11th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

DELINQUENT SALE NOTICE.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 5th day of December, 1898, the several amounts set opposite the names of the respective shareholders as follows:

	No. Cert.	No. Shares.	Amt.
G. Schmitt	46	1	$ 10
G. Schmitt	53	1000	100 00
G. Schmitt	57	500	50 00

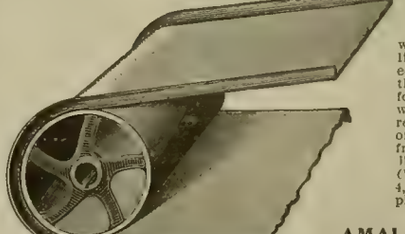
SPADONE'S CONCENTRATOR BELTS.

PATENTED.



This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ¼ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

AND PACIFIC ELECTRICAL REVIEW.

No. 2014.—VOLUME LXXVIII. Number 6. SAN FRANCISCO, SATURDAY, FEBRUARY 11, 1899. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

Increasing Mexican Gold Output.

Since silver's decline, gold mining in Mexico shows as rapid advance, proportionately, as in the State of Colorado, where it has risen from $5,000,000 in '92 to $22,000,000 in '98. Till within the last few years, Mexican gold production was a by-product of its silver mining industry. Since the fall in silver practically reduced the cost of gold mining in Mexico 50% as compared with the cost in other gold-producing countries, Mexico has realized its position and also that better transportation facilities must precede development of its gold resources. Accordingly, the Mexican Government is inviting the investment of capital by liberal concessions to corporations or individuals organized to develop lode and placer mines in that Republic, at the same time extending the country's railway system as rapidly as practicable. The gold yield of Mexico has increased from $1,224,621 in '93 to $7,584,182 in '98. Taking the silver yield of that country for the same years, it is noted that in '93 the silver production as compared with the gold yield was as 44 to 1, while during the past year it was as 9 to 1. As elsewhere the new effort tends to eliminate the speculative element and raise it to the dignity of a legitimate industry. It will also be found that gold mining requires greater outlay and more working capital for its successful prosecution.

Nevada Co., Cal., Mine.

On this page appears one of our specially engraved portrayals of a Nevada Co., Cal., gold mine, the Texas, giving a good general idea of the outs[illegible] appearance. The photograph from which the [illegible] panying engraving was made is one of the best of the kind ever received in this offie.

The Texas mine, near Nevada City, Cal., which had been idle nearly fifteen years, resumed work under a new ownership in September, '97. The present operators are principally a San Francisco company. The property comprises 120 acres and has a U. S. patent title. Under the previous operators several tunnels and a 140-foot shaft had been run and considerable ore taken out. The present company have sunk a perpendicular shaft 250 feet, run 608 feet of tunnels and cut four ledges, upon which they have run 812 feet of drifts.

Hoisting and pumping machinery, with large power drills in the drifts and small ones in the stopes, are in operation. A 10-stamp mill has recently been completed, to which ten stamps will be added.

The formation is granodiorite. The ledges on the 250 level are from 1 to 8 feet thick, carrying a high percentage of sulphurets and galena. Mill tests of the ore gave such results as warranted the erection of the present milling plant.

Within the comparatively brief period of eighteen months, the Texas Mining Co. has done the systematic development work herein enumerated, and, in their businesslike manner, they prospected the mine before building a mill, something which, though not always done, is always commendable.

The company employs thirty men. It is incorporated under the laws of California as the Texas Gold Mining Co. A. Korbel is president and K. Ruiz secretary. It is not a stock selling proposition.

Industrial Notes; Personal; Recent California Mining Incorporations; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Catalogues Received, 158.

IN iron, as in other metals, advancing prices and prospective demand occasion a wholesale "dealing in futures" on a scale unequaled by sales or options in any stock market. During last week at Cleveland, Ohio, the entire Lake output of iron ore for 1899 has been placed, the only deterrent clause being "unless labor troubles interfere." The amount thus sold for delivery is upwards of 14,000,000 tons.

TAX on mine products in Colorado, as everywhere else—if at all—should be on the net and not the gross products. It is hard enough for a miner to be taxed by class legislation on what is left him after he pays all expenses; but to be taxed on the gross output which to have produced may have run him in debt, is to put a burden on the mining industry that any State Legislature cannot in justice afford to attempt or continue.

OCCASIONALLY exaggerated reports are made of fortunate inventors paid most enormous sums for some clever devices, so simple that all wonder "why no one thought of it before." These are mostly fairy tales. As such may be classed the most recent, to the effect that a Thompsonville, Conn., watchmaker —H. M. Buck—is to be paid $28,000,000 by the British Government "for a rotary cylinder which increases the speed of steamships 50%, and at the same time does away entirely with the vibration of vessels." As explained, his method concerning the first proposition is to utilize all the expansion of steam for driving power; regarding the second, the cylinder is alleged to be so additionally devised as to do away with the condition that causes the piston rod to come to a dead stop in the cylinder.

AN Anaconda, Montana, miner writes, illustrating in a striking way how miners and all connected with the mining industry in this west half of America contribute to the prosperity of the East. He goes on through a column of space detailing in what way the Montana miner, from the time he rises till he goes to rest, uses the products of Eastern manufacture, everything he eats, drinks, wears or works with coming from an Eastern producer, the writer finally following him into an Eastern-made shroud, in an Eastern-made coffin, with a gravestone of New Hampshire product. It is a condition that time alone can cure. The East will never have the splendid source of mineral wealth possessed by the region west of the 100th meridian, but in time the latter section will be more industrially independent and be able to retain a large share of the wealth produced from the field, the forest and the mine.

A Needed Government Institution.

What is said by C. D. Walcott, Director of the U. S. Geological Survey, is usually deserving of consideration. In a recent letter he suggests that the U. S. Government establish a museum of practical geology, in which he points out that the Geological Survey has 40,000 correspondents, who furnish information regarding the country's mineral resources, and that the proposed plan would doubtless meet with co-operation by mineral producers everywhere, believing that a collection of a representative display of economic minerals and quarry products could be secured at little cost. He shows that such a collection would be useful in the work of the Survey and possess value for any person interested in any mineral product who may want statistical information and see specimens of all products pertaining to the special line in which he is interested. "For example, a person wishing to obtain information in relation to marble, either as a producer or a consumer, should be able to personally examine specimens of marble from the principal quarries of the United States, and, by inquiry, to learn all that is known of any particular marble in which he may be interested."

The commercial value to each locality of such a display of its mineral resources is manifest. Director Walcott is further of the belief that: "In addition to the series of rocks and fossils illustrating stratigraphy in succession of the sedimentary rocks, and the systematic collection of minerals and ores, an exhibit showing how geological work benefits the daily life of the people should be developed. An illustration of this would be a representation of the artesian water supply of the semi-arid region, showing the stratigraphy and structure of the sedimentary rocks, and how hydraulic and geologic investigations clearly indicate the region in which artesian water development may be carried on successfully. Mining and areal geology should also be illustrated in such a manner as to place before the student and intelligent observer the import and value of such work. There exists at the present time at the national museum a geological collection of great value, but it is not as complete as it is desirable to have it, and it cannot be kept up to date with the present force and space. There should be provided within a few years a building that could accommodate all the geological collections of the Government. It is not proposed that these collections should be removed from the custody of the national museum, but that they should be properly installed and cared for independently of the general collections of the museum."

Commenting further on mining and economic geology he says: "In creating the United States Geological Survey, Congress and the people whom it represents expected that its energies would be largely devoted to the development of the mineral resources of the country. How this method should be accomplished was left to the director and his principal assistants, who, by scientific training and long practical experience, were the best qualified to judge what could and what could not be done by such a corps of specialists as the Survey must necessarily consist of—men whose whole life is devoted to the abstract side of geology, and whom neither the regulations of the Survey as defined by law nor the exigencies of their official duties would permit to participate in the practical or commercial development of these resources. It was evident that these specialists could not take the place of either the prospector or the mining engineer, as a somewhat superficial view of the subject had led some to think they might. They should, of course, understand the principles which underlie the work of either of these classes of men, but they cannot be expected to possess that expertness of instinctive second sense in each of these professions which can be acquired only by lifelong practice. The Survey should furnish an accurate basis upon which the work of each of these experts, so indispensable in the development of the mineral resources of the country, may be founded. The Survey stands, so to speak, between them and nature. It should endeavor to tell the prospector where he may and where he may not prospect to advantage for this or that valuable mineral."

Director Walcott's suggestions deserve commendation and active support. They are direct, practical and timely, and their value to the prospector, miner and mining engineer is clearly indicated in the last paragraph quoted.

"HAS chloride of gold ever been discovered in a natural state?" asks a Bishop, Cal., reader. So far as the writer knows, No. It has been argued that three salts of gold have existed and may still be found "in nature"—silicate, sulphide and chloride, all being soluble, and "in the presence of certain reagents, also existing naturally, can be deposited in metallic form." To those who make a specialty of speculation and theory concerning the origin of gold, etc., the subject is an interesting one. T. Atherton asserts that in '91 in the Deep Creek mines, Nambueca, N. S. W., he found what he believes to be gold existing as a natural sulphide. He says: "Taking 200 grains of ore from a sample assaying seventeen ounces fine gold per ton, grinding it finely and heating for some hours with yellow soduim sulphide, on decomposing the filtrate and treating for gold I got a result at the rate of twelve ounces per ton. This was repeated several times with the same result. It would appear that all the gold in the pyrites (and I have never found any gold existing apart from the pyrites) has originally taken its place there as a sulphide." It is known that chloride of gold will deposit its metal on a metallic base in the presence of any other organic substance. On this subject Chas. Wilkinson shows in his experiments the artificial production of the nucleus of a nugget from deposition of chloride of gold on iron pyrites, and found that when the solution of gold chloride was four grains to the ounce of water that the pyrites or other base began to decompose, the iron sulphide changing to yellow oxide. Our Bishop correspondent speaks of an alkaline formation there that has an indication of chloride of gold." Prof. Jos. Le Conte says: "Ore deposits, using the term in its widest sense, may take place from any kinds of waters, but especially from alkaline solutions, for these are the natural solvents of metallic sulphides, and metallic sulphides are usually the original form of such deposits."

THE idea is now advanced that the present commercial activity is the result of the increased gold output and the unusual development in that direction. There is much of sound reasoning in such an idea. Development of the mining industry, whether for gold or anything else, always occasions a demand for so many things that any undue activity therein is always followed by a "business boom" such as the present one. More especially is this the result in the case of gold mining. Besides the ordinary sequence of increased trade requirements occasioned thereby, the production of gold in such quantities as those of '96, '97 and '98, coupled with the promise of similar continuation, has aroused public interest, recreated confidence, appealed to the imagination and excited hopes and ideas that find practical operation in a variety of industrial investments. Then, too, the late war with Spain has tended to enliven and enlarge the business outlook. There is abroad a big stir that makes for larger action throughout, and the horizon broadens. The revival in mining is accompanied by a revival in business and the profits and prospects resultant from general production. That the output of gold is at the base of the present world-wide activity is perhaps best evinced by the general feeling that while there is a possibility that the present advance in metals, lead, tin, copper, etc., may be followed by a reaction in prices, yet, in the case of gold, that its price or value will not decline, no matter what the total output may become.

THE California statements regarding alleged railroad combinations which would result in "a Vanderbilt line from ocean to ocean," are not in accord with existing facts, nor with a situation and intent likely to obtain. The stated idea is to consolidate the N. Y. Central, the Chicago & Northwestern and the Union Pacific Railways with view to ocean terminus at San Francisco. Owners of the Vanderbilt railroad lines act on a settled formula, viz.: "no investment west of Chicago." They will carry freight that far west but want nothing more responsible or entangling than ordinary railroad freight and passenger alliance further this way than 86° W. longitude.

Concentrates.

AT Mercur, Utah, miners work eight hours, are paid $2.50 per day; board and lodging, $24 per month. The mines are dry.

"ELECTRIC BELTS" and kindred health devices into which such appliances enter, are frauds and unworthy serious attention.

A DANIELL'S CELL is a zinc-copper couple immersed, the zinc in dilute sulphuric acid and the copper in a sulphate of copper solution.

THE highest London quotation for silver during the last half of this century was in '64, 62¼d per oz., British standard, .925 fine, equivalent to $1.40, 1000 fine.

THE Payne mine at Sandon, B. C., a silver-lead property, is locally credited with having paid its owners in net profits $1,200,000 in 1898. Its capitalization is $1,000,000.

THE Sandon, B. C., Miners' Union is the first labor union to receive a charter from the provincial government. Special legislation was required before the union could be incorporated.

HON. R. C. CHAMBERS, Utah's resident director of the Bimetallic Union, has issued a call for those interested in the protection of lead, that the movement in Canada to overthrow the tariff may be resisted.

CONSIDERABLE present mining legislation is being enacted by the several State and Territorial Legislatures. Arizona is trying to secure, in addition, a mine inspector. A similar bill was introduced in the California Legislature this week.

THE Comstock's year of largest yield was '77, when its output was, gold $14,520,614 68, silver $21,780,922.02—a total of $36,301,536.70. This is exclusive of the mill tailings for that year of which 129,639 tons were treated, yielding $1,169,265.28.

TWO THINGS determine the value of circulation to advertisers—its character and its extent. The character of circulation can be judged by examining the publication itself. Its table of contents, or the contents themselves, is a sure index of the kind of people who read it.

RED BRASS is composed of 90 parts copper, 10 zinc; white brass, copper 65, zinc 35. Bell metal is an alloy of 78 parts copper and 22 zinc; German silver, copper 50, zinc 25, nickel 25. W. T. Garratt & Co., Fremont & Natoma Sts., San Francisco, furnish such manufactured alloys in any quantity.

THE most recent award of the Longstreth medal by the Franklin Institute of Philadelphia was to T. B. Doolittle, the inventor or discoverer of hard-drawn copper wire, it being of added commercial value, such wire, while retaining its full percentage of conductivity, having additional tensile strength.

THE velocity of a fluid flowing from an aperture is as the square root of the height of the head of the fluid. The theoretical velocity, therefore, in feet per second is as the square root of the space fallen through in feet and 64.333; so that for one foot it is 8.02 feet. The mean velocity is about 5.4 feet, or 0.673.

WHEN wrought iron is subjected to a tensile strain before rupture takes place it increases in length from 15% to 20% and contracts in area at the fractured section about 25%. Its tenacity ranges in value from 50,000 to 65,000 pounds per square inch; wrought iron diminishes in tensile strength when rolled into sheets.

THE altitude of Mt. Diablo, Cal., is 3850 feet; of Mt. Shasta, 14,440 feet; of Mt. Whitney, 14,522 feet. From Diablo to Shasta, in an air line, is 244 miles north; to Whitney, 222 miles southeast. Prof. Geo. Davidson thinks that he saw Shasta and Whitney from Diablo about seven years ago, under certain unusually favorable conditions—466 miles.

AT Black Hawk, Colorado, are now in operation 882 stamps, of which 220 are rapid-drop and 662 slow-drop. The former are still locally regarded as an innovation. Those at the N. Y. mill weigh 1000 lbs. each. They go ninety drops per minute, and crush four tons each every twenty-four hours, about three times the amount crushed by the slow-drop. The amalgamation results are satisfactory.

AN Eastern copper broker says: "Last May I figured that all of Boston's copper stocks were selling in the aggregate for $125,000,000, and came to the conclusion that they were selling high enough. They have since doubled in selling price. In 1894 Boston's copper properties at the highest quotations of the year sold for $54,000,000; in 1895 at $80,000,000; in 1896 at $75,000,000 and in 1897 at $110,000,000. To-day they are selling for about $250,000,000."

IN '50 the United States produced 650 tons of copper; in '60, 7200 tons; in '70, 12,600 tons; in '80, 27,000 tons; in '90, 115,966; in '96, 202,235; in '97, 219,481; in '98, 235,790 tons. The estimated home consumption last year was 114,000 tons; exports, about 235,790 tons; net imports foreign copper, 12,900 tons. In '50 the United States produced 12,000 tons of refined lead; in '60, 14,000; in '70, 16,000; '80, 87,000; '90, 128,000; '96, 168,000; '97, 186,000; '98, 200,000 tons.

"FLOURING" of quicksilver is its coating with what appears to be a thin film of some sulphides, so that when it is separated into globules they refuse to unite. The same trouble is also called "sickening." Water colder than 50° F. has a tendency to cause "flouring." Floured quicksilver can be readily collected by adding minute quantities of sodium and stirring it about. A weak solution of cyanide is also of avail, though, if from connection with base ores, the mercury becomes foul, the best way to restore it is by retorting.

TOWNSITE entries may be made by incorporated towns and cities on the mineral lands of the United States, but no title can be acquired by such towns or cities to any vein of gold, silver, cinnabar, copper or lead, or to any valid mining claim or possession held under existing law. When mineral veins are possessed within the limits of an incorporated town or city, and such possession is recognized by local authority or by the laws of the United States, the title to town lots is subject to such recognized possession and the necessary use thereof, and when entry has been made or patent issued for such townsites to such incorporated town or city, the possessor of such mineral vein may enter and receive patent for such mineral vein, and the surface ground appertaining thereto: *Provided*, That no entry shall be made by such mineral-vein claimant for surface ground where the owner or occupier of the surface ground shall have had possession of the same before the inception of the title of the mineral-vein applicant.

TO FIND the h. p. necessary for a battery of stamps, multiply the weight of one stamp by the number of stamps in the battery; the height of lift in feet by the number of lifts per minute; add one-third of the product for friction; the result will be the number of feet-pounds per minute; divide by 33,000; the result will be the h. p. required. A 900-pound stamp in a 5-stamp mill, with a 9-in. lift, 90 drops to the minute, would thus figure out: 900 × 5 = 4500 × ¾ = 3375 × 90 = 303,750; one-third of 303,750 = 101,250, which added to 303,750 = 405,000 ÷ 33,000 = 12.272 h. p., or about 2½ h. p. for each stamp.

G. W. MILTON, in a communication to the Denver *News*, says of altitude and ores: "As a matter of fact, there is not a single lode mine, either gold or silver, in the State of Colorado, below an altitude of 7500 feet, and there are very few, if any, below 8000 feet. Why this is so I am unable to say. Yet it is a matter of fact, notwithstanding there has been millions of dollars expended in prospecting and developing properties below 7500 feet in Colorado. Yet there is not a single mine to show for the outlay. Hence, in my judgment, prospectors and investors will do well in future to consider altitude as well as indications."

WHILE undoubtedly cyanide is deadly poisonous, yet the fact that notwithstanding its general use there are very few cases of loss of life goes far to argue that ordinary care, the same that is practiced in any department of mining or metallurgy, insures immunity from danger. Of the many thousands of men using it for so many years it is believed there have not been more than a dozen fatal accidents recorded as resultant therefrom. Hydrogen peroxide is recommended as an antidote, applied as a 2½% solution, given as a hypodermic injection every three or four minutes in different parts of the body, the stomach being simultaneously washed out with a 2% solution of the peroxide.

THE report of the mining industry of the South African Republic for 1897 in the Transvaal shows that the capital of the 198 gold mines working at the end of 1897 was $363,863,750. Of these, twenty-eight mines with a capital of about $50,000,000 paid $14,750,000 in dividends, or nearly 30%. Sixty-four other mines were producing gold, but paying no dividends, and some could not pay without a considerable reduction in working expenses. The other 106 mines were in course of being opened up. The total value of the gold yield in 1897 was $58,250,000, or $15,000,000 more than in 1896. Of this 66% was from crushing mills and 34% by chemical extraction. The quantity of ore worked was 5,741,311 tons, which gave a yield of a little over $10 to the ton. Working expenses were about $6.62 per ton, leaving a net profit of $3.38 per ton.

IN Japan some specialities in metallic alloys are in use, of whose composition the following details are supplied: Shadke consists of copper with 1% to 10% of gold. Articles made from this alloy are laid in a pickle of blue vitriol, alum, and verdigris, until they acquire a bluish-back color. Gui-shibu-ichi is an alloy of copper containing 30% to 50% of silver. It possesses a peculiar grey shade. Mokume consists of several compositions. Thus, about thirty gold leaves (genuine) are welded together with shadke, copper, silver, and gui-shibu-ichi, and pierced. The pierced holes are, after firm hammering together of the plates, filled up with the above named pickle. The finest Japanese brass consists of 10 parts copper and 8 parts zinc, and is called "siachu." The bell-metal, "karakane," is composed of copper, 10 parts; tin, 10 parts; iron, 0.5 part; and zinc, 1.5 parts. The copper is first fused, then the remaining metals are added in rotation.

THE indicated power of a steam engine is equal to the product of the area of the piston in inches, the pounds pressure of the steam per square inch and the distance traveled by the piston in one minute. The effective power in excess of back pressure, loss and condensation in well constructed engines is usually about .84 of the indicated or theoretical power. The nominal power bears no fixed relation to the indicated, nor to the effective power. In calculating the nominal power, the mean effective pressure in low pressure engines is assumed to be seven pounds and in high pressure engines twenty-one pounds. The nominal velocity of the piston, whether in high or low pressure engines, is 128 times the cube root of the stroke in feet. The range is from 120 to 300 feet per minute. In practice the piston not unfrequently is made to travel 900 feet and upwards a minute. Experience has determined no limit beyond which it cannot be run with advantage.

THE reservoir site question asked by a Mountain Ranch, Calaveras Co., Cal., a Grant's Pass, Or., and a Cherry Creek, Arizona, correspondent may be answered as follows: Reservoir sites located or selected and to be located and selected under the provisions of "An Act making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, eighteen hundred and eighty-nine, and for other purposes," and amendments thereto, are restricted to and contain only so much land as is actually necessary for the construction and maintenance of reservoirs, excluding, so far as practicable, lands occupied by actual settlers at the date of the location of said reservoirs, and the provisions of "An Act making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, eighteen hundred and ninety-one, and for other purposes," which reads as follows, viz.: "No person who shall after the passage of this Act enter upon any of the public lands with a view to occupation, entry or settlement under any of the land laws shall be permitted to acquire title to more than three hundred and twenty acres in the aggregate under all said laws," is construed to include in the maximum amount of lands the title to which is permitted to be acquired by one person only agricultural lands, and not include lands entered or sought to be entered under mineral land laws. Further detailed information can be had from the California Surveyor-General, whose office is at 610 Commercial street, San Francisco.

THE "patio process" was invented in 1557, and is so called because a patio or yard is required for its operation, and the ore is crushed and ground fine in arrastras. If there is any gold in the ore 50% or 60% of it may be saved by putting silver or copper amalgam into the arrastras. Some of the Mexican ores have to be roasted to remove certain chemicals which they contain, but this is not the case with all of them. The paste from the arrastras is spread in heaps upon the floor of the patio, and after it has hardened somewhat by the evaporation of a part of the water it contains, it receives a quantity of salt in proportion to the amount of silver in the ore. Then it is mixed by men with shovels and by the tread of horses or mules, and a day or two later a mixture of copper, vitriol and salt is added. Then follows more treading and mixing, then quicksilver is spread over the mass and trodden in, and the next day there is another mixing and treading. These performances are repeated on alternate days, quicksilver being added one day and the mass being trodden the next, until the treading has been repeated seven or eight times. The quicksilver unites with the silver and forms an amalgam. The formation is carefully watched, and when it has reached the proper condition the amalgam is gathered up into hide or canvas bags. Some of the quicksilver is squeezed out and the rest is driven off by evaporation and condensed in a pipe that runs into a tub of water. Hundreds of horses and mules are worn out annually in treading the ores. Sometimes loaded barrels or heavy stone wheels are used for mingling the ore and chemicals, and they do it as well as the horses' feet could do it, and the injury to the horses' hoofs by the chemicals is thereby avoided. The reduction of a mass takes from twenty to thirty days.

MANY substances held in solution or suspension in hot water are deleterious to the metal of the boiler. Some are actually corrosive; some are merely productive of scale, which may hide corrosion, or may, if of sufficient thickness, cause the metal of the boiler to become overheated. Some substances which are soluble in water at ordinary temperatures, and even at 212° F., are insoluble in water at higher temperatures and are, of course, precipitated in fine powder. This powder falls to the bottom in quiet water, but is kept in suspension and rises to the surface in places where it is sufficiently agitated. New combinations are often formed with the mere dirt which has been there all the time in mechanical suspension. Oil and grease returned from the engines by an open-heater or a condenser is a new element, especially at high temperatures. Sulphate of lime is less soluble in water of high temperature, and at fifty pounds pressure above the atmosphere is entirely insoluble. Carbonate of lime held in solution in water containing carbonic acid and bicarbonate of lime, deposit carbonate of lime as the temperature of the water rises by driving out the carbonic acid and by separating into carbonate of lime. These two substances form the basis of most kinds of scale, a third being simply earthy or sandy matter in the water. If the ebullition be strong enough to keep most of this deposit in suspension at or near the top of the water, it may be removed by a surface blower; or, if a closed feed heater be used, the feed water may be raised by the use of live steam nearly to the temperature of the boiler and the deposit allowed to settle to the bottom or other surface of the heater and removed by blowing or washing out. Care should be taken to wash out with warm water, if possible.

BROADLY speaking, the Coast Range of California consists of Tertiary and Cretaceous, mostly sandstones and calcareous clay slates, almost everywhere greatly disturbed, folded, and frequently highly metamorphosed, and traversed by dikes of eruptive rocks and upheaval axes. In the portion north of San Francisco these are frequently caused by tufaceous and scoriaceous or crystalline lava flows, emanating from distinct volcanic vents now extinct. In contrast to the Coast Range, the Sierra Nevada has in general a central axis of granite or other rocks, occasionally traversed by volcanic vents, on the flanks of which lie more or less crystalline and metamorphic slates or schists of Palæozoic, Triassic and Jurassic age, with edges upturned at a high angle or sometimes vertical. Abutting against this, the proverbial bedrock of the California miner, there lie on the border of the great valley strata of marine deposits, mostly of the Tertiary, but northward also of the Cretaceous age, which are but slightly disturbed, and into which the rivers flowing from the canyons of the Sierra have cut their immediate valleys, flanked by bluffs from 40 to 70 feet high. From opposite San Francisco northward, on the lower foothills, appear immense gravel beds, mostly gold-bearing, and these are partly overlaid by eruptive or volcanic outflows and tufaceous rocks, also accounted as belonging to the Tertiary age. In the northern portion of the Sierra region the eruptive rocks become more and more prominent, covering an enormous area called the lava bed in the northeastern part of the State, and, as in the Cascade Range in Oregon, forming the body of the comparatively low range upon which the volcanic cone of Mount Shasta is superimposed.

IN the construction of a canal where the natural slope of the country is greater than is permissible for the grade of the canal, the excess of the natural slope of the ground over the desired grade may be concentrated at falls introduced in the canal, and thus a direct course and any desired grade may be maintained. The bottom of such a canal will form a series of steps over which the water falls into an overfall pit or water cushion below. If is observed the natural fall on natural water courses it will be seen that the channel bed is much deeper and wider under the fall than elsewhere, and is formed in the shape of a heart, with the small end down stream. This may be copied from nature in constructing artificial channels. The bottom of the overfall pit should be from 4 to 6 feet below grade and should be well paved or timbered. The introduction of such falls will greatly increase the inclination of the water surface for a distance in the canal above the fall proportional to the depth of flow in the canal. It is similar to taking away the vertical retaining wall which is supporting a level bank of very loose sand, and leaving no obstacle to its assuming its natural slope. Because of this increased inclination of the water surface the velocity of flow just above the fall, for several feet, will be greatly increased, and the bottom and sides of the canal must be paved or timbered from the fall to a distance of 12 to 20 feet above the fall to prevent erosion by this increased velocity. Sometimes steep, wooden chutes are adopted instead of vertical falls. It is customary in such cases to erect a vertical bulkhead for the chute to discharge against, and thus break the force and velocity of the falling water. If the velocity is too great after passing the bulkhead, it may be checked by inserting wooden bars into the water, reaching from the bottom to above the surface. The tops of the bars should incline down stream. The effect of this will be to make the velocity uniform, or nearly so, from the canal floor to the water surface, and it will also make the depth greater. It would be better still to widen the penstock into which the water discharges and reduce the grade for a short distance below.

The Dow Engine.

The structure, theory, design, construction and operation of the steam engine are of constant interest, comprising as many advances, modifications and changes as are manifest in other forms of power producers. In this regard valves and valve gear are prominent. The limitations of the plain slide valve, the governor regulated cut-off of the Corliss and other proposed or proved systems have in turn had full discussion. The Dow engine is the latest candidate for interest in this line. It has but one valve at each end of each cylinder, where the Corliss has two, the drop and dash-pot is left out, and, in general, the valve gear is simplified.

Josiah Dow, the inventor, gives some details of his engine. It is a double vertical compound, the present construction using steam of 125 to 130 pounds boiler pressure, and intended to run at about 150 revolutions per minute. The cylinders are placed close together, side by side, only room enough between them to provide for the valves, with their passages, and non-conducting spaces to prevent loss of heat, the whole being surrounded by a space filled with a non-conductor and covered by lagging, preferably of wood. All the valves and steam passages have their positions between the cylinders to facilitate the transfer of steam from one cylinder to the other and for compactness' sake, with the use of a simple operation of the valves. The final exhaust passage is, however, completely separated not only from its cylinder but from the steam passages by non-conducting spaces. The first cylinder exhausts through very short passages at either end—merely continuations of the ports—directly into the second, the up stroke of the first coinciding with the down stroke of the second. The vertical arrangement of cylinders and connections is chosen to aid compactness and to facilitate the desired balance. The vertical form also permits the base and foundation to be compact. The valves (see Fig. 1) are placed

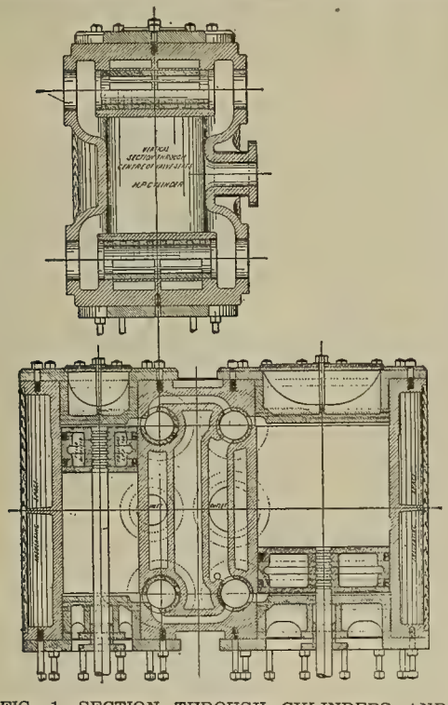

FIG. 1.—SECTION THROUGH CYLINDERS AND VALVE GEAR.

as closely as possible to the interior of the cylinders, as with the Corliss engine, but there are only two to each cylinder, the induction and eduction for each end being combined in one; the passages for the full steam and the exhaust are completely separated in position and by non-conducting spaces. There are but four valves for the two cylinders. The events of the valves are so arranged that the beginning of exhaust from the high-pressure cylinder becomes directly the initial steam for the low-pressure, the lead for both coinciding and in control of the valve at the first cylinder, the valve at the second cylinder being always open in time to permit its free passage. The work in each cylinder at normal load and pressure is exactly the same, and the weights of the reciprocating parts are balanced against each other by means of the pistons being cast hollow, that the smaller one may be filled with sufficient lead to make its weight equal to that of the larger. The high-pressure valves (see Fig. 2) are cylindric in shape and so constructed that the induction steam passes entirely through them from end to end.

The steam chamber is placed directly against the high-pressure cylinder, and at the top and bottom is connected with the valves by means of passages in the casting which lead around both their ends, from which steam enters; to the outside of the body of the valves no steam can obtain access from this chamber, being prevented by packing rings which

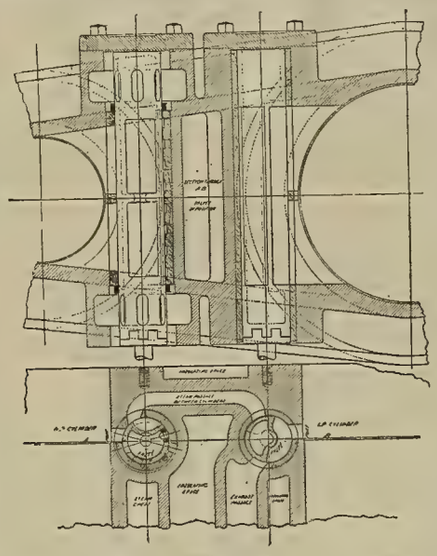

FIG. 2.—DETAIL SECTIONS OF VALVES.

have their bearings upon seats at either end of the main portion of the valve. In this manner pressure, acting upon the valve is claimed to be regulated from its own interior through means of the steam port at one side, and at the opposite side the balance port, arranged with steam-tight packing strips, and with sufficient area to secure a firm seat against both cylinder and exhaust ports, while passages outside the bushing into which the valve fits, communicating with the cylinder ports, complete the balance against the changing pressure within the cylinder. The valve receives always the same degree of movement, regardless of the point of cut-off, and, consequently, says the inventor, no ridges can form in the seat, where a smooth, perfect contact is maintained, improving with wear, while but little force is required for actuation. Exhaust is effected by this valve through a depression in its side formed to complete the passage, which connects the cylinders at the proper time.

The valves in the second cylinder need no cut-off, its steam expansion being a continuation of that begun in the first. They open the connecting passage just before the high-pressure valve releases the steam, and close it with enough time before expansion is completed to leave the steam within it of higher pressure than the terminal of the second cylinder. The passage is opened again when compression has brought the pressure in this cylinder back to the same degree and the completed compression is reached with a pressure about equal to the terminal of the first cylinder. The valves also control the exhaust and compression of their own cylinder.

The single wristplate, shown in Fig. 3, controlling

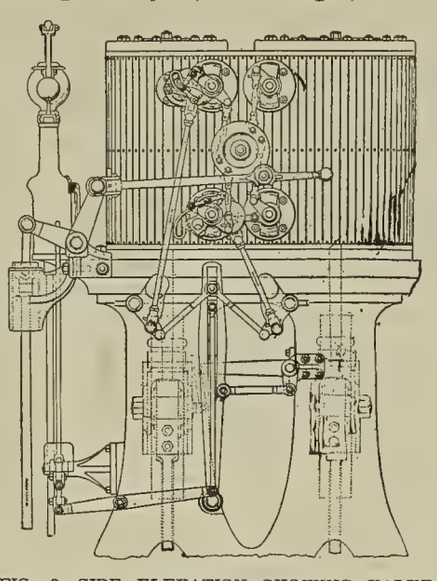

FIG. 3.—SIDE ELEVATION SHOWING VALVE MECHANISM.

the main movements of these valves, is intended to devote its quickening action just when most needed, while giving rest to the valve during the ingress and egress of steam. The cut-off movement is taken from the crosshead, that it may be simple in connection and accomplished at identical positions of the piston for both directions of its movement with its own angular advance. This movement is communicated to a vertical lever which has a slot through its upper limits, in which is carried a sliding block, having connection with the governor, from the center of which links are attached leading off at either side to rocker arms, which also carry connecting rods leading on one side to the upper, and on the other side to the lower valve gear. Cut-off is always completed at an identical position of these rockers, and they are intended to be so arranged that, if the block is down in the slot, the cut-off will come much sooner than if it be up, the range following such part of the whole stroke as may be desired, from no admission of steam at all to a coincidence with the closing effected by the main gearing at about seven-eighths stroke.

FIG. 4.—CARDS WITH AND WITHOUT AN INTERMEDIATE RECEIVER.

The connecting mechanism from the cut-off lever through to the valve gear is in intent so that only just such a part of the whole movement of the lever reaches the valve as is necessary to effect the cut-off, the remainder being lost motion, taken from one limit or the other, according to the position of the block in its slot. This is effected by the rods, which convey this movement to the valve gear, having certain parts of their movement, when the sliding block is downward through an arc, in movement of the rocker, at the lower end, with a fixed or nearly fixed center at the other end. This afterward changes into direct and accelerated movement through the use, in connecting to the cut-off plates at the valves, of toggle links which also have the effect of absorbing excess of movement, when the block is upward, to a longer cut-off, with the intended effect of making the action of the cut-off quick and of the right de-

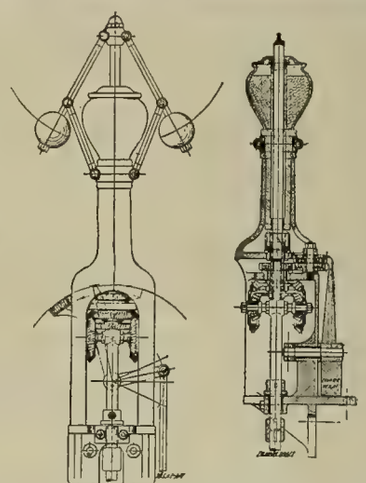

FIG. 5.—ELEVATION AND SECTION OF CHRONOMETRIC GOVERNOR.

gree, yet with smoothness and absence of shock when brought to rest in either direction. The block is moved up and down in its slot by the regulating efforts of the governor and is, with its connections, balanced to reduce its resistance to movements in either direction. As the movement on one side of the lever is effecting a cut-off, that on the other side is restoring the cut-off mechanism to its original position, one action pressing upward upon the block while the other draws downward. Thus, with such correction for balance in the rocker-arms on either side of the lever as is necessary to emphasize their action, they leave the block free to regulation from the governor.

The immediate valve gear, Fig. 3, is set upon a bonnet, as with the Corliss engine. It comprises a crank having a collar keyed to the protruding end of the valve stem, immediately behind which is another collar, mounted and revolving upon a bearing at the end of the bonnet. This collar receives movement through a crank cast upon it, with connection to the wristplate; it also has cast upon it an arm set in line with the valve-stem crank, to which it is connected by means of two links jointed to each other, to the arm and to the crank, as in the construction of a toggle. The center joint of these links carries a strong pin, on which revolves an anti-friction roller, which rests within and follows a groove in a plate set immediately behind the links. This is the cut-off plate, Figs. 7 and 9, and has its arc of movement upon another bearing formed on the bonnet end behind the first. The axis of movement, of this plate, the arm with its actuating crank and the crank upon the valve stem are identical with that of the valve itself. The arc-shaped groove in the cut-off plate through which the anti-friction rollers run is also concentric with the axis of the valve through the

greater part of its length. So long as the roller is held here, the crank which receives movement from the wristplate, and that on the stem of the valve, must move exactly together, the valve being thus revolved to the opening of exhaust, back again to its closing and on to the opening of the steam port, directly from the action of the wristplate. It will also

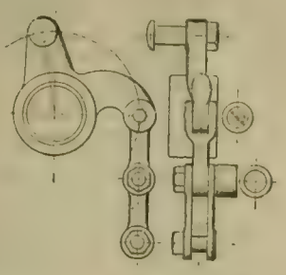

FIG. 6.—DETAILS OF GEAR UPON VALVE STEM.

in emergency close the steam port; but the groove in the cut-off plate is so arranged that when the steam port is just fully open, the roller has passed by easy transition into another portion of the groove, being another arc, which is concentric, not with the axis of the valve stem, but with the center of the pin

FIG. 7.—CUT-OFF EFFECTED WITH LAP.—MOVEMENT STILL CONTINUING IN DIRECTION OF ARROW.

in the end of its crank, and which has a radius of construction just equal to the length of the link between the crank and the roller. On reaching this changed arc, the roller is carried through it with ready expansion, and as the pin end of the valve crank is now in the exact center from which the arc is struck—the link having the exact length of its radius—the valve can no longer move, notwithstanding a forward movement of the arm to which the second link is pivoted. The end of the valve-stem crank

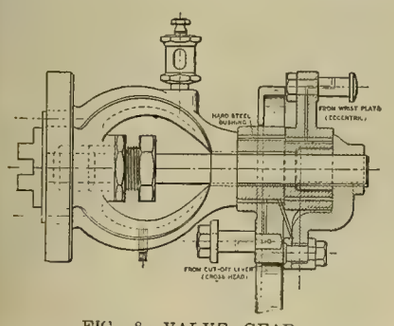

FIG. 8.—VALVE GEAR.

necessarily keeps its position in relation to the center of the arc in which the roller end of its connecting link is moving, and if the plate is moved the crank will move with it, only changing the position of the roller in the groove. A leather-covered buffer, however, is in position upon a spur raised from the plate before the valve-stem crank, where it

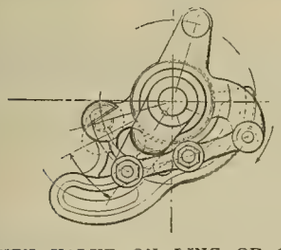

FIG. 9.—WITH VALVE ON LINE OF OPENING BY MAIN MOVEMENT.

comes to rest quietly through the gradually decreasing motion, controlled by a reverse arc in the groove, which joins the concentric and eccentric portions.

The engine is governed by the Dow chronometric governor shown in Fig. 5. This differs radically in principle from the ordinary fly-ball governor, although resembling it somewhat in appearance. The position of the valves is not dependent on the position of the fly-balls, which here act, not as centrifugal weights, but as a rotating pendulum, tending to maintain an isochronous speed. This pendulum is driven by an elaborate differential bevel-gear train, the difference in speed between the shaft of the engine and the rotating pendulum being taken up in a sector-shaped gear operating the valve cut-off mechanism. Thus, so long as the work done on the pistons is not exactly balanced by the load and there is a tendency toward acceleration or retardation of the speed, this acceleration or retardation itself continues to move the valve mechanism toward a shorter or longer cut-off position, respectively, until the two speeds are equal.

The Genesis of Petroleum and Asphaltum in California.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER.

Distillation.—The maximum quantity of liquid hydrocarbons is obtained from the solids by a process of distillation under high pressure and low temperature, combined with rapid condensation.

Temperature and pressure exercise a considerable influence on the nature of the products of distillation. The method of cooling also exercises great influence in the rearranging of the molecules and upon the nature of product of distillation.

Slow cooling or quick cooling make no difference on some substances, but the difference between slow and rapid cooling has a marked effect on others.

If we reduce the heat of water from a high to a low temperature it will not affect the constitution of the water; whether we lower the temperature slowly or quickly, the result will be the same. Water that is slowly cooled from the boiling point down to the freezing point will have the same properties as water that is rapidly cooled down from 212° to 32° F., but that does not hold good with all substances, for example, if we take three bars of steel of equal dimensions and make them all red hot; then if we slowly cool one bar down to say 50° in the air, and if we cool the second bar by slipping it slowly into cold water, and if the third bar be suddenly cooled by plunging it into cold water, the effect of cooling these three bars of steel will produce a different effect in each bar. The bar that is slowly cooled in the air will remain comparatively soft and be of fibrous texture, malleable and ductile, capable of being bent double without breaking. The second bar will be harder and more elastic and can only be bent a small degree without breaking. The third bar will be very hard and brittle and cannot be bent, and if struck with a hammer will fly to pieces, the fracture showing a crystalline structure. Now these three bars were simply deprived of the same number of degrees of heat. They were reduced from an equally high degree of heat to an equally low temperature but we find that the difference in time occupied in cooling makes a vast difference in the molecular structure and properties of the metal.

These facts are well known to all workers in metal, but it is not so well known that in cooling mixed gases, especially the hydrocarbons, from a high to a low temperature, the effect on the constitution of the gases varies with the time occupied in cooling, and that difference between quiescence and agitation during cooling has different effects on the molecular constitution of mixed gases, especially with mixed hydrocarbons.

Place two retorts of the kind used for making illuminating gas from coal in one oven, so that they will get equally heated up to a bright red heat, and let us charge each retort with one hundred weight of good coal, which will make 500 feet of gas. Now let us cool the gas from retort number one slowly by passing the gas slowly through a number of pipes placed vertically in the open air in the manner usually done in gas works; let us cool the gas from number two retort rapidly by passing the gas through a multitubular condenser surrounded with a freezing mixture and we will find the result to be that 500 feet of permanent gas and five pounds of tar will be delivered by number one retort, and we shall get about 300 feet of permanent gas and thirteen pounds of tar from number two retort. There we find that rapid condensation reduce two-fifths of the gas to a liquid state; and if we were to distill under high pressure and low temperature we should with rapid condensation accompanied with agitation, reduce nine-tenths of the gas to a liquid state. To produce permanent gas from coal we should distill under low pressure and high temperature and cool the vapors rapidly under agitation.

When gas is violently agitated during the cooling process a greater quantity is condensed into the liquid state than when kept in a quiescent state during the cooling process.

When gas much cooled is passed through a coke tower down which heavy oil is trickling, this oil will absorb the light hydrocarbons of the gas.

The boiling points of the hydrocarbons of petroleum are altered very considerably by foreign, or even by the traces of foreign subtances, being present. The presence of different substances during distillation has an influence on the distillate. It has been found that when a mixture of chlorine with hydric chloric is passed through an ordinary charged gas retort it acts as a hydrogenating or dissociating agent producing a tar very rich in benzol. On the other hand zinc chloride in the presence of hydric chloride greatly increases the yield of heavy hydrocarbides from coal and can convert some of the lighter constituents of the tar when distilled therewith into heavy ones.

The nature of the product also depends on the material of the retort. A rough surface will facilitate chemical changes.

By repeated distillations solid paraffin can be gradually changed in liquid kinds and olefines.

Mineral tar by repeated distillation in the presence of superheated steam will be converted into gas if the united vapors of the steam and tar are decomposed by heat after each distillation.

Sulphur when present in a still with paraffin retards its ebullition. The introduction of sulphur into a paraffin boiling at 140°-150° C. may retard its boiling point as far as 180°-200° C. according as it may exist in a greater or less quantity. In consequence of the presence of the sulphur in the still retarding the ebullition, the vapors of the paraffin are heated to a point far above their boiling points; therefore they are decomposed to hydrogen and carbon. The liberated hydrogen combines with the sulphur vapors, forming sulphuretted hydrogen.

Shales containing $\frac{1}{10}$% of sulphur yield scarcely any paraffin on distillation.

YIELD OF GAS, OIL, ETC., FROM SHALES AND COALS AT HIGH AND LOW HEAT.

		Good Shales.		Boghead Coal.		Gas Coal.

What is known under the general name of petroleum includes a series of hydrocarbon oils varying widely in physical properties. Some are limpid fluids with many intermediate grades, others are found viscid and tar-like.

Hydrocarbons generally exist in three different conditions: First, the gaseous condition, wherein the equivalents of hydrogen are equal to or greater than the number of equivalents of carbon; second, in the liquid state where the equivalents of carbon exceed the equivalents of hydrogen; third, in the solid state where the carbon exceeds the hydrogen in still greater ratio than in the liquid state.

Their color by transmitted light ranges from a light yellow through orange and red to a reddish brown, so dense as to be translucent only in their films, while by reflected light it passes from a light dusky color to a dark green and to a black. They differ as markedly in odor and also in other properties, some having a very disagreeable smell, while others are considered even pleasant.

There is a wide range in their gravity. The greater the quantity of carbon in proportion to the hydrogen any one of them contains, the greater is its specific gravity, the higher its boiling point and density of vapor. In the same oil field, the same series of strata, and the same stratum there are differences of composition.

The following are the commercial names of the products of distillation of crude petroleum: Cymogene, rigolene, gasolene, naphtha, benzine, kerosene, maltha and paraffin. There is no well marked division line betweem any of the above named products, but they gradually merge one into the other.

Their division is simply one of caprice. These hydrocarbons are extremely complex and different in composition. The proportion of carbon and hydrogen is extremely variable. There seems to be no end to the different combinations of hydrogen and carbon.

The great diversity in the physical and chemical condition of the bitumens can be attributed:—First, to the organic remains from which it was distilled—different kinds of terrestrial vegetation and marine vegetation: by natural process these organic remains may have been changed into peat, lignite or coal before distillation; second, the degree of temperature to which organic remains are subjected during distillation; third, the pressure to which it is subjected during distillation; fourth, the time consumed in effecting distillation; fifth, the presence of different substances during distillation—sulphur, lime, water, oxygen, nitrogen, etc., which render their properties very different; sixth, the condensation of the bitumen after distillation whether rapid or slow, agitated or quiescent; seventh, the material of the still; eighth, to repeated distillations; ninth, evaporation; tenth; sulphuration, oxygenation, etc. Electricity may also play an important part.

Latest Progress in the Application of Storage Batteries.*

By JOSEPH APPLETON.

The history of the storage battery in this country is curious, and probably comprises more trouble and trials than any other branch of the electrical industry. Until 1894 the use of storage batteries in this country proved most disastrous to all concerned. The reasons were many, but may be summed up briefly as follows:

1. The batteries were poorly designed.

2. No attention was paid to the mechanical features, the chief idea being to get the greatest capacity for the lightest weight.

3. The batteries were much over-rated, their full capacity being given as their normal working capacity.

In addition to this, the storage battery business generally was in an unsatisfactory and weakly condition. Litigation was the principal cause. Now the conditions are very different. All are familiar with the changes which have been made during the last five years in the commercial end of the business. All the disturbing elements have been removed, and the business has been put on a proper and substantial basis. These results are best seen from the following table, which gives the weight of plates alone. The figures for 1898 have not been tabulated, but they will show that the use of storage batteries is progressing more rapidly than ever:

Year.	*Pounds.*
1894	349,000
1895	1,112,800
1896	2,315,300
1897	3,607,300

Or, in 1897, ten times the business of 1894.

The storage battery is entirely different from any other piece of apparatus which is used for supplying electrical energy, being constructed and operated on the principle of chemical action instead of mechanical motion. There must, naturally, be a vast difference between these two principles.

In the mechanically operated apparatus, or generator, the output of electrical energy is the result of the conversion of the mechanical energy applied to it while in action, and the regularity of the output is dependent on the steadiness of the mechanical energy applied and the satisfactory running of the generator and motive power. The operation is purely mechanical and is subject to the interruptions to which all moving machinery is liable. Again, such apparatus, if overloaded to an excessive degree, will give visible signs of distress, and if the overloading is very great, or is continued, will probably give way in some mechanical feature.

In a storage battery hundreds of horse power can be silently stored, and thousands of horse power delivered for a short period, with no apparent action or change in the battery.

Any mechanically operated apparatus is liable to interruption through breakage or injury to one of its parts, but in a storage battery the chemical action will continue, and consequently the output of energy until all the material on the plates has been converted.

An overload has not the same effect on a storage battery as on a mechanically operated generator. For a short period an overload, even of great extent, does not injure a storage battery. It causes the chemical action to take place more rapidly, or, to be more exact, causes more material to be subjected to the chemical action; and this, if not continued too long, or repeated too often, does not affect a good storage battery.

One of the most valuable features of a storage battery is that it will safely take care of any sudden and momentary overload in the system, such as grounds or short circuits, and if operating in parallel with generators or rotary converters will relieve them of such overloads and consequent strain. I have frequently seen batteries burn out grounds and an underground system, discharging for a short time at an enormous rate. And in case of batteries operating on railway loads it is a common thing to see an occasional momentary discharge at a rate equal to twice the hour rate of the battery.

It may be well to consider before going further into our subject the question of the rates of charge and discharge of storage batteries and their capacity at different rates. Of course, this will vary somewhat with different types of battery, but not to a great extent. The more rapidly you discharge a battery the smaller is its available capacity. It is only within the last few years that a one-hour discharge rate has been possible with a storage battery, and it is very largely due to the fact that storage batteries can be discharged at such rapid rates that their use has been growing so rapidly.

Storage batteries are not free from trouble any more than other apparatus, but under favorable conditions the comparison is much in favor of the storage battery. As is the case with all machinery and apparatus which have to be operated continually for any length of time, the results obtained depend, not entirely on the design and construction, but on the care and judgment with which it is operated.

In the early days the storage battery manufacturers, in order to maintain a bare existence, had to jump at every opening for the use of a storage battery, whether the conditions warranted it or not. Now things are entirely different. The business is on a commercial basis, and it is not a question of getting an order at any price, but securing business which will prove satisfactory and permanent. Now storage battery manufacturers will insist on proper conditions for the operation of their batteries or refuse to put them in. This is as it should be, and I think I am perfectly safe in saying that during the last four or five years there has not been a storage battery installed in this country except under conditions which justified its use. Of course, some experimental applications have been made which may or may not prove satisfactory, but this does not come under the head of the general application of the storage battery.

It should be distinctly understood that all conditions of electrical distribution are not suitable for the use of storage batteries, and that it is more to the interest of the manufacturer than the purchaser to confine himself only to those situations which are suitable, for every failure which is recorded is heard of one hundred times to every success.

The trend of electrical engineering to-day is toward the concentration of generating machinery, the highest possible economy in operation and the utilization of motive power and generating machinery to the fullest extent so that the investment may produce the greatest return. These conditions make the storage battery indispensable, for without its aid it is impossible to maintain a constant load on the power house. Every application of electricity has its time of maximum output, or "peak," and no matter how many different applications are supplied from the same system their peaks will not fit in so as to even matters up; but, on the contrary, it is found that in many cases the peaks occur at about the same time. This is particularly noticeable with a railroad and a lighting load. Again, concentration of generating machinery means a larger area for distribution and the necessity of sub-stations, in order to keep down the investment in conductors, and experience shows that in the majority of cases storage batteries are cheaper than the copper alone, which would otherwise be necessary, leaving out the advantages at the power house.

It used to be customary to refer to European practice to show what could be done with storage batteries, and even now I believe that some people think that European batteries and methods are superior to ours in this country. In connection with this idea, there is one thing that I particularly wish to emphasize, and that is the difference between American and European conditions. In Europe storage batteries are not subjected to the severe work they have to stand here. They are looked upon more as a reserve, and are not expected to discharge at their maximum rate every day, and perhaps twice on some days. As an example of this, I will tell you what one of the Tudor Company experts from Germany said when he was over here last spring. He was attending the National Electric Light Convention at Chicago, and one of features of that convention was the large storage battery plant which the Chicago Edison Co. had recently installed. During one afternoon while the convention was being held a very heavy thunder storm came on, and the battery was called upon suddenly for its maximum rate of discharge, and the full rated capacity was talken out. The maximum rating of this battery was a complete discharge in one hour. Our German friend thought that was doing pretty well, but when we told him that this storage battery was installed under contract which allowed the battery to be discharged at this rate every day during the winter, he was horrified and said: "You must not let them work the battery in that way; tell them they must hold it as a reserve." We told him if we did that we should not be able to do any business. The installation is interesting as being the largest individual battery ever installed for a lighting station. They had their original power plant in Adams street, which is practically in the center of the down-town section of Chicago. This plant was abandoned in August, 1894, just six years after it was started up, and a large modern power house was erected on the river at Harrison street. Their maximum load in 1897 was 44,000 amperes or 8,000 electric H. P., and early in 1898 it was estimated that the maximum winter load for that year on the down-town system would be in neighborhood of 55,000. In fact, the point had been reached when new investment, either in generating capacity or battery, had to be made. The peak of their load during the winter occurs about 4:45 P. M., and lasts forty-five minutes to one hour and a half. Their method of operation is as follows:

The current from the Harrison street station is transmitted over the lines to the old Adams street building, being distributed over the network of mains from that point. The distance between Adams street and Harrison street is about 3,340 feet, and the tie lines between the two places have a capacity of 66,000,000 c. m. If additional generating capacity had been provided for the peak of 1898, it would have meant a corresponding increase in this tie line, but by installing batteries at Adams street, the center of distribution, not only was the saving in generating capacity effected, but also in the tie line. The battery installed at Adams street consists of 166 cells, arranged eighty-three on each side of the three-wire system, and each cell contains eighty-seven plates $15\frac{1}{2}'' \times 32''$. The containing cells or tanks are constructed of 2″ ash, lined with five-pound sheet lead. The dimensions of each cell are 9″ wide, 6′ 8″ long and 4′ high.

*Condensed.

New Things That Are Old.

TO THE EDITOR:—The old adage that "there is nothing new under the sun" may have been true in the time of Solomon, but is no longer true in these inventive and progressive days when almost every day brings something new in the way of invention or discovery. I will refer but to two instances to show that many inventions and discoveries considered new were long ago suggested and some put in practice. I note in the January 14th issue of your journal that the Union Iron Works have designed and patented a mode of increasing the yield of a stamp mill by using an intermediate crusher to do fine work, crushing the ore to ¼-inch dimensions before being fed to the mortar of the battery. It is an exceedingly simple arrangement, will prove very effective and is undoubtedly an improvement, for it throws the heavy work on the crushers and relieves the batteries, increasing their duty largely and therefore is a valuable addition to every mill.

Several years ago in my own mill I placed a pair of rolls between the crusher and the mortar. They were set ¼ inch apart and they gave an increase of 65 per cent in the yield of the mill. The use of rolls for this purpose I consider preferable to a second crusher for several reasons, which I think will readily occur to any one experienced in such work. To test the efficiency of rolls in connection with a crusher, I found that a pair of rolls, 20-inch diameter and 12-inch face, 100 revolutions per minute, would take the crushed ore from the crusher and supply a 20-stamp mill, none of the ore going into the mortar being larger than ¼ inch in size and this so fractured that the stamps made quick work of it.

To mention another illustration of the old adage quoted above: I have lately seen an extract from the London *Telegraph* in which it is stated that flat steel springs placed on each side and stern of a vessel, at a proper angle, will drive the vessel slowly ahead, two or three miles per hour, as the vessel rolls broadside or sinks deeply by the stern—in other words, that the action of the waves can be made a propelling power, to be used in calms found in all oceans and seas and especially in the "doldrums" or "horse latitudes" on or near the equator, where the vessel will often lie becalmed for weeks at great loss of time and expense. These springs are to be used only as necessity requires, and are detached as soon as the vessel is driven by her sail power.

This idea is not new. In 1855 Auguste Ionan, a Frenchman in San Francisco, suggested to me the same thing and we put it in successful practice experimentally, using a model 4 feet long, furnished with six flat finely tempered steel springs, three on each side. The model was placed in a 12-foot trough of water, and on a rolling motion being imparted to it the vessel moved readily and steadily forward. This was practical demonstration.

Sonora, Jan. 28th, '99. LOUIS BLANDING.

Of Usual Occurrence.

A leading machinery manufacturer of Chicago writes: "I wish to compliment the MINING AND SCIENTIFIC PRESS on the attention that an item in it attracts. A recent announcement has brought a snowstorm of replies. They come from every part of the country. We have had several responses from the East, New York, New Jersey, etc., the writers stating they saw the advertisement in your paper."

It is not, however, always usual to have our readers mention the source, for busy men rarely have time to say where they saw the advertisement that attracted their attention, the main point being with them to get what they want.

A prominent firm in San Francisco, large manufacturers of mining machinery, write: "Did our advertisement cost five times what we pay for it, we would consider it a good investment. It is a big business producer."

A Denver, Colorado, concern say: "Whatever else we drop we want our advertisement continuously in the MINING AND SCIENTIFIC PRESS. We are in constant receipt of letters from all parts of this State, Arizona, Utah and Mexico that we feel confident are the result of our announcement in your columns."

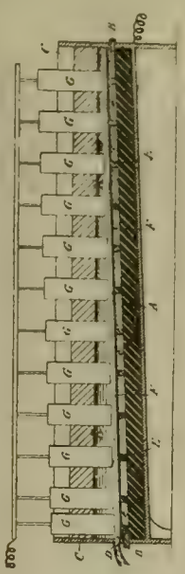
These three letters were received this month with several others similar in tone. It is perhaps, in order to say that this paper believes that its paid bona fide circulation west of the Missouri river exceeds that of any similar publication.

Latest Mining and Metallurgical Patents.

Patents Issued January 31, 1899.

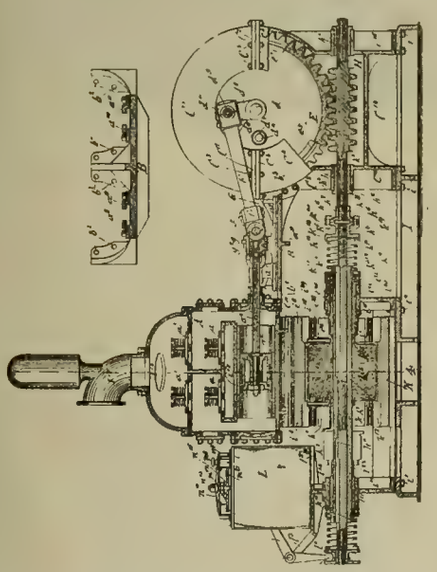
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ELECTRIC FURNACE.—No. 618 391; H. Bovy, Geneva, Switzerland.



An electric furnace with furnace body of conducting material, carbon blocks supported in upright position on body, each block forming a lower electrode, a filling of carbon powder between the blocks, carbon plates arranged between their upper ends and resting upon filling and additional electrodes arranged and supported above lower electrodes, the latter electrodes being of such size as to be rendered incandescent by the passage of the electric current.

ELECTRIC PUMP.—No. 618,404; C. Eickmeyer, Yonkers, N. Y.

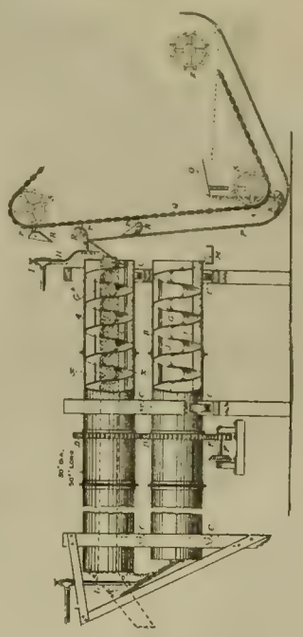


Combination with an electric motor and a sleeve-shaped shaft on which the armature of the motor is mounted, an auxiliary driving shaft on which the armature shaft is arranged; means for permitting the relative longitudinal movement of auxiliary shaft in armature shaft, for causing its rotation by the rotation of the armature shaft and means for resilienty and yieldingly supporting the auxiliary shaft in its longitudinal movement. Field coils are wound on the magnetic poles, so that the thickness of the coils on one side is in a fixed ratio to the thickness of the same coils on the opposite side; while the depth of the coils on one side is in a fixed universe ratio to the depth of the coils on the opposite side, there being a flat rectangular series of coils for magnetizing or demonetizing the armature field magnets by means of dynamometric regulation.

MECHANISM FOR OPERATING MINE DOORS.—No. 618,678; Humphreys & McGrew, Irwin, Pa.

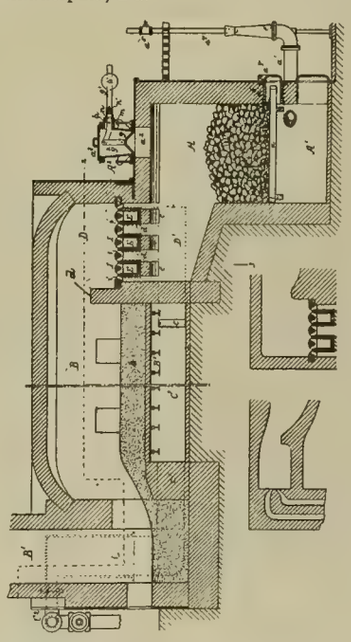
The combination with a mine door and a tramway running past the same, of two wheel bars extending longitudinally of the rails and located respectively at the sides of the door, a sliding connection bar coupling the two wheel bars to transmit movement from one to the other, means for supporting the bars so that they will move vertically under the influence of the wheels passing over the said bars, a rock shaft actuated by the wheel bars and a connection between the rock shaft and the door to operate the door.

APPARATUS FOR EXTRACTING METALS.—No. 618,622; Phillip Somerville, Bishop, Cal.



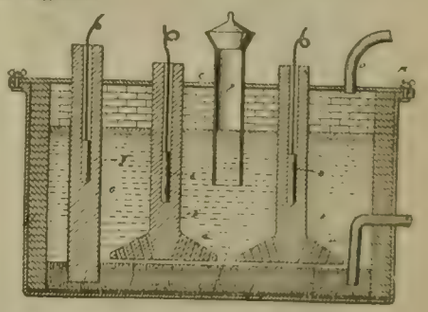
An apparatus for extracting metals consisting of parallel barrels having annular disks closing one end with central inlet openings for the material, a frame-work and roller support for the barrels, means whereby they are rotated in opposite directions, spiral flanges fixed to the interior of the barrels for advancing the material therethrough, devices for feeding material and fluid matter to the uppermost barrel, means for separating the coarse from the fine material and delivering them separately, and means for transferring material from the discharge end of one barrel into the inlet end of the barrel below. The rotatable barrel is mounted on the frame or support and the flange extends from one end to the other of its interior.

METALLURGICAL FURNACE.—No. 618,751; D. Townsend, Philadelphia, Pa.



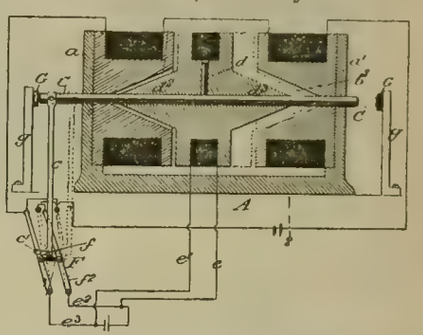
The combination of a metallurgical furnace, the gas-producing chamber *A* having the grate *a*, a blast pipe communicating with the space under the grate, a hopper in the upper portion of the producer, a passage *D'* for the gases generated, transverse air ducts spaced to form passages *d'* communicating with the passage *D'*, a perforated partition above the air ducts and passages, some of the perforations communicating with the ducts while others communicate with the passages, a combustion chamber *D* above the partition, a heating chamber *B* beyond the combustion chamber and with which the combustion chamber communicates, a stack, air passages in the stack and under the bed of the heating chamber, the air passages communicating with the ducts.

APPARATUS TO PRODUCE CHLORINE, ZINC, ETC., FROM MIXED ORES.—No. 618,575; F. M. Lyte, London, England.



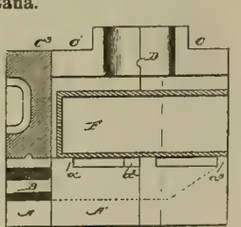
A conjoint process for the treatment of complex sulphide ores of zinc usually carrying lead and silver, such treatment consisting in grinding and calcining the ore at a low red heat to convert the zinc sulphide into zinc sulphate, in extracting the zinc sulphate formed by lixiviation; in converting the zinc sulphate into zinc chloride by treating it with an alkaline chloride and refrigerating; in concentrating the zinc chloride formed and rendering it anhydrous by heating it in the presence of metallic zinc, assisting the action of the zinc by electrolysis, in order to decompose the water of hydration, and in subsequently decomposing first the zinc oxide and then the zinc chloride by means of electrolysis with an anode of carbon and a cathode of fused metallic zinc for the production of chlorine and metallic zinc and in the case of complex sulphide ores recovering the lead and silver by smelting.

DIRECT-ACTING RECIPROCATING ELECTRIC MOTOR.—No. 618,702; J. H. Mason, N. Y. City.



A direct-acting reciprocating electric motor comprising two field magnets spaced apart, an armature arranged to reciprocate between them, one provided with centrally arranged conical recesses, the other with centrally arranged conical projections located at all times partially or wholly within the recesses, the pair of magnets and the armature being provided with adjacent vertical annular faces surrounding the projections and recesses, whereby the magnetic field is enlarged and is provided means for maintaining a constant electric current in one direction through the armature, means for energizing the field magnets and means under the control of the movement of the armature for changing the direction of the current through the field-magnet coils.

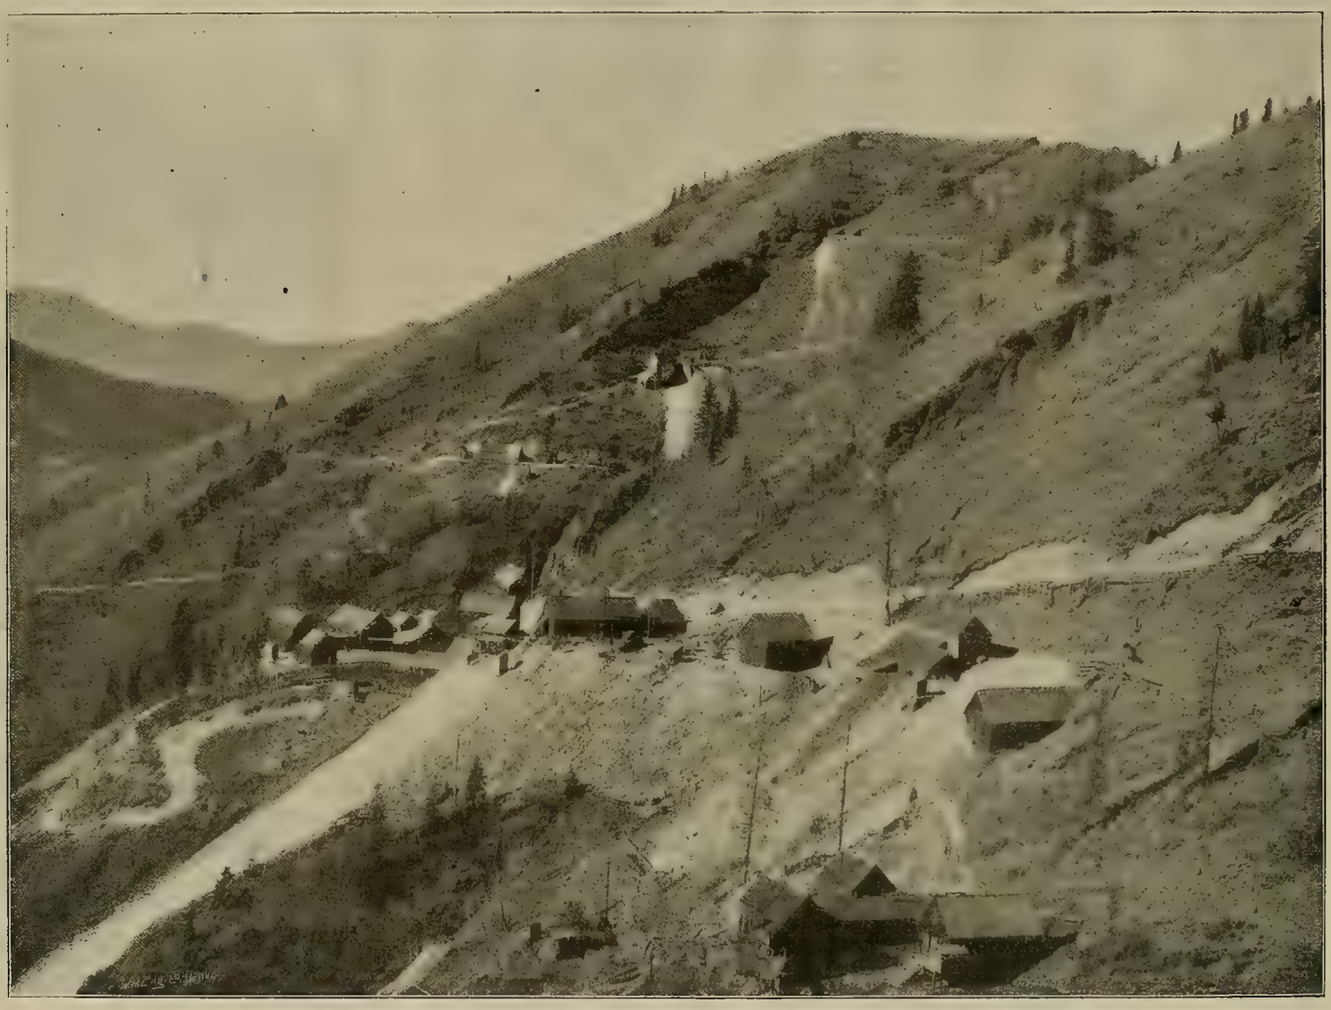
ASSAY FURNACE.—No. 618,768; J. R. Bapty, Helena, Montana.



An assay furnace with a base formed in sections with separate combustion chambers formed centrally therein, deflecting surfaces at the forward end of the combustion chambers, muffle-supporting blocks rising from between the combustion chambers and at each side thereof, arch sections resting on base sections and forming the muffle chamber whereby, when the muffle is removed, the combustion chambers are open and free of access, a muffle-chamber closing section at the rear end of the furnace and a base section upon which it rests, having an entrance aperture for the combustion chamber. The blocks at the forward end of the furnace extend the width of the muffle chamber, the muffle bridging the muffle chamber.

Mining Among Mountain Snows.

Colorado this week reports unusual snowfall, resulting in some cases in serious loss and inconvenience. Winter mining in Colorado requires a large degree of pluck, endurance and determination, as it is carried on at unusually high altitudes. Few mines in the State are less than at an elevation of over 8000 feet above sea level, and in several instances mining and milling are carried on the year round at an elevation of 12,000 feet. When with that is coupled a 5-foot snowfall and drifting winds, it will be partially realized what such steady prosecution of work means. Herewith is presented a view of the highest postoffice in the State—Smuggler, in San Miguel Co.—on one of the loftiest crests of the Rocky mountains, nearly 13,000 feet above the sea, the site of the famous Smuggler-Union mine, from which ore worth more than $15,000,000 has been extracted. Here over 250 men are employed the year round. Of course, in such heavy weather as the present, with so heavy a fall of snow on the levels, and deep drifts everywhere, the camp is totally isolated. Supplies of all kinds are provided in large quantities against such contingencies, and beyond being temporarily off from communication with the outside world, the regular underground workers pay little attention to the storm.



THE TOWN OF SMUGGLER, THE HIGHEST POSTOFFICE IN THE STATE OF COLORADO.
High up to the left is the terminal of the Smuggler-Union tramway, the postoffice and store.

TAKING HEAVY MACHINERY UP THE SMUGGLER TRAIL.
Some transportation problems in the mountains are difficult, but hard work and sticking to it always lands the heaviest load at the top.

On this page is also presented another cut showing the slow process of taking heavy machinery up the Smuggler trail. These pictures are from photographs taken last October for the enterprising Telluride *Journal*.

Minting Gold and Silver.

NUMBER II—CONCLUDED.

The next operation is designed to remove the silver; this is effected by boiling in nitric acid, when the silver dissolves, leaving the gold in a finely divided state. The plant used for this purpose consists of a number of large porcelain jars capable of holding about thirty-five gallons each,* arranged in a double row and heated by steam pipes; they are inclosed in a chamber provided with sliding doors to prevent the escape of the noxious fumes, which are carried into a tall chimney from which they issue in a yellowish cloud. The dissolved silver is drawn off by means of a large siphon made of native California gold (valued at $3000) and transferred to a vat made of wood (capacity 2000 gallons), resembling those used in breweries. The vat contains several hundred gallons of salt water, and the silver is precipitated by the chlorine, a workman facilitating the operation by agitating the liquid with a large paddle provided with a long handle.

The precipitated silver is drawn off into large filters placed on trucks and thoroughly washed by running water until the test of litmus paper shows that all trace of acid has been removed. The chloride of silver now resembles pure white cottage cheese. It is transferred to another vat lined with lead. Zinc (which has been previously granulated by pouring while melted into cold water) is added to the silver, together with a little sulphuric acid; the chlorine deserts the silver for the baser metal, forming a soluble salt of zinc. The solution is allowed to flow off, and the precipitated silver, after having been thoroughly washed, is pressed into round cakes, dried in an oven and melted in the furnace; it is finally cast into a bar, and is found to be uncontaminated with its former base associates, being usually 998 to 999 fine. The gold which remained in the porcelain jars is in the form of fine powder, and resembles sifted gravel. After thorough washing to remove the silver nitrate the gold sediment is placed in cast iron pots and boiled in strong sulphuric acid with a little niter added; it is then washed, dried, pressed into cakes and melted. The bars are nearly pure gold, about 999 fine.

The melter and refiner now weighs out the requisite amount of copper to form the coin standard, which is nine parts of gold or silver (as the case may be) and one part base metal, our coin standard being nine-tenths fine.

The alloy is melted in large crucibles made of plumbago, holding over 6000 ounces, and constantly stirred to render the mass homogeneous. The standard metal is cast into flat bars called ingots, 12 inches long, ¾ inch thick, and from 4 to 1½ inches wide; the ingots are filed to remove the ragged edges, and the rough tops cut off with large steam shears. Two samples from each melt are assayed, and if the ingots are found to be of the proper fineness and of uniform composition, they are delivered to the coiner, who transfers the ingots to the rolling mill, and when they have been sufficiently laminated by successive rolling and annealing, the strips are passed through the draw bench to reduce them to the exact thickness required for the coin. This operation is similar in principle to wire drawing, and consists in squeezing the flat strips of metal between two stationary steel cylinders set to the desired gauge. The strips are now passed to the cutting press, which consists essentially of a round punch, the size of the planchet or blank required for the coin, working up and down very rapidly into a hole on the steel bed plate. The strips are passed by hand through the press, and the blanks fall into a box below. The unused portion of the strips or clippings is returned to the melter and refiner and remelted. The planchets are next taken to the adjusting room, where employes are seated at a long table, each one provided with a little balance and a file. Each one is supplied with a pile of planchets, and weighs each planchet against a properly adjusted counter-weight. The planchets that are too light are thrown into a separate pile and returned to the melter and refiner, to be remelted with the clippings, while those that that are too heavy are adjusted by filing on the edge.

The next operation to which the blank pieces are subjected is to impart the raised edge, technically called milling. The blanks are fed by an attendant into a tube, and drawn horizontally, in single file, through a gradually narrowing channel formed by a groove in the periphery of a rapidly revolving disk on one side, and a stationary segment of corresponding curve on the other, keyed a little closer to the wheel at one end. The blanks are in this way compressed on the rim, acquiring the milled edge. This machine is capable of milling as many as 1200 pieces per minute. The blanks are now taken to the pickling vats, where they are immersed for a couple of minutes in weak sulphuric acid for the purpose of removing the black oxide of copper; they are then washed in pure water and placed in a rotating cage filled with sawdust. This rapidly dries the blanks, and when removed to the coining room they have acquired a fine surface.

The coining machine operates on the mechanical principle of the toggle joint; the blanks are placed in a vertical tube. A pair of feeders catch the bottom piece and carry it forward, where it rests in the collar between the upper and lower dies; the lever is now descending with the upper die while the lower die remains fixed; the pressure increases with perfect uniformity up to the maximum, which is equivalent to about ten tons for the dime, eighty tons for the double eagle and 120 tons for the silver dollar. The pressure gradually decreases again by reason of the relaxation of the upper joint, the lower die pushes the piece out of the collar into which it has expanded, and from which it acquires the reeded edge. Meanwhile, the feeders have provided another blank, and as they bring it forward they push the coined piece into a channel, through which it slides into a box beneath the machine. The coins are then inspected by the foreman, and any cracked or defective pieces set aside.

After the coins have been counted and weighed, they are tied up in linen bags and delivered to the treasurer in drafts of $5000 each. The accuracy of the adjustment of the weight is so nice that there is rarely a deviation from the true standard weight of as much as $\frac{1}{100}$ of an ounce in any delivery of either gold or silver coin.

As a final precaution, the assayer is required by law to select at random one coin from every lot of $20,000; these are sealed in envelopes, numbered, and placed in a strong box provided with two locks; the key of one is kept by the treasurer and the other by the assayer. These sample pieces are called the pyx. They remain sealed until the commissioners appointed by the President assemble at the annual assay in February of each year to test their purity and weight; and it has rarely happened that any piece has been found to exceed the small limit of tolerance allowed by law.

*The charge for each jar is usually 190 pounds of granulations and 175 pounds strong nitric acid.

Some Opinions on Mine Management, Etc.

TO THE EDITOR:—There is no hard-and-fast method of conducting a mining business that will apply under all circumstances; consequently, the organization of directive force must needs conform to actual individual requirements; but, beyond the question of having a manager, or resident director, there should be no considerable difference of opinion as to what constitutes a good mine organization and consequent management.

With your permission, I will present some impressions of what seems to me essential for the organization of an efficient mining force; but, before doing so, will notice one or two practices which experience has shown to be radically wrong.

I will first notice a practice, which is not uncommon with English companies, of sending to the mine a general director or manager, a superintendent, a secretary, a chemist, perhaps an engineer and foreman or foremen, all appointees of the home office. An organization of such individuality and ponderosity is too high-toned and top-heavy for almost any mine to carry, for it will necessarily be expensive, and the probabilities are that it will be extravagantly so, beside which, each being an independent appointee, there will be absence of harmony, and extravagance in detail. And, still further, each appointee will have some interested friend in the home management to whom he will be secretly reporting; the reports will be conflicting, and, if they ever encounter one another, there is liable to be a hot time in the old town, with a serious reaction. The promoters may say: "Whose business is this but ours?" The reply is: "The rank and file of investors, and the miners, who are injured whenever a mine is damned through knavery or folly, and not upon its merits."

A practice is sometimes indulged in by people of the Atlantic side, but not so frequently as formerly, of sending a man out to manage a mine simply because he was a good, pious citizen, reckoning that, even if he knew nothing about mining, he would conduct the business honorably.

People of the East do not know, as we of the mining regions do, that such ventures are very uncertain; that a supposedly moral man, of good habits, when removed from home influences, is quite as likely as not to become a shining example of total depravity.

It may be essential with foreign companies, and sometimes with Eastern companies, to send a resident director; in such event, the home provision should stop there. This director should select his own superintendent, the superintendent his clerk, and, generally, the chemist, if they are required, and his foremen of the different departments, and the foremen should select the employes under them.

This arrangement provides a responsible head all through. The director then controls everything, and becomes responsible to the home management for everything, each one under him being controlled by him and subject to his direction, which should be only general and exercised solely through the superintendent, who should have the sole direction and control of all detail to be observed or accomplished through his subordinates.

Of course, the magnitude of the business should determine the elaborateness of the corps of management.

With companies organized nearer home, there is no reason for a resident director. The board of control should appoint its superintendent, and the further organization should be completed as already indicated.

We now arrive at the question of management. The resident director should give only such directions to a superintendent as would be given by a board of management, and attend only to such outside business as does not fall within the scope of a superintendent's duties. If he goes beyond this, he is demoralizing the superintendent, thereby making him inefficient—in fact, had better dispense with him before he has accomplished general demoralization.

The superintendent should be reliable and an energetic, level-headed man of affairs, having a good, general practical knowledge of all departments of the business, and, preferably, a specialist at none, for, in such case, it is not infrequent that the general responsibility is lost sight of in following too closely the one hobby. He should spend time every day in careful observation about the mine and works, to make sure that everything is in good order, and to impress the employes that things are not occurring by chance. A mine, including the attendant works, that does not require the presence of a managing head right along and all the time, does not require one at any time.

A man who has obtained his mining knowledge at some school of mines is not necessarily competent, nor likely to be until he has served an apprenticeship at the business, and not then unless he has the necessary business qualifications. The same observation applies to technical graduates. The most that can be said for them is that they have acquired a foundation upon which they may become proficient through experience, provided they have the requisite natural ability.

Much of the success of an organization as above outlined is dependent upon a rigid adherence to the rule that each employe is responsible to his immediate employer, and that any and all directions given shall be through the proper channel, as, for instance, the superintendent shall not pass a foreman and assume a foreman's duties by giving orders to a foreman's employes. Such conduct demoralizes the force.

Some success, too, depends upon the estimate which the employes form of the ability of the superintendent, and the confidence they entertain of his watchful care of everything pertaining to the avoidance of accident. It requires but a very short time for old miners to closely determine his knowledge and ability. To emphasize this point, I will say I have known of hoisting rope being used upon shafts until so worn that individual pieces of wire in plenty in sections of 2 or 3 inch lengths, and sharp at both ends, could be picked out. Whenever such a condition is allowed to obtain, with attendant loss of life, the superintendent should be punished for murder, and the condition, without loss of life, should be punished as severely as assault to murder.

It is not infrequent that, where the business is not large, the superintendent does the assaying. In practice this is, generally, not good, for whenever it becomes known that he is devoting certain hours each day to restricted occupation, advantage will be taken of it to play.

Frequently, where the force is not large and the company pays its bills regularly and promptly each month, which obviates the necessity of opening an elaborate set of books, the superintendent can perform the clerical duties without detriment to the general interests, as the time required for its performance will not aggregate more than three or four days per month, and can be so sandwiched as not to interfere with other business.

Every mine organization should do business upon a cash basis and settle its indebtedness regularly every month, and when it cannot do that it should quit, and that, too, while there is money in the treasury to meet all liabilities.

One of the most trying experiences of a superintendent is the running of a mine upon wind, particularly if it is situated away out upon the frontier, where the only existing law is might, and where coolness and nerve will serve him as against the lawless element that keeps upon the borders of civilization. There may be but little of this element in employ, but recruits may come from God knows where. One thing is certain: whenever hell breaks loose the devil is in active control. When so situated, if an employe does not do his duty, or goes on a drunk, he is likely to be impertinent, perhaps abusive, if remonstrated with, realizing, as he does, that he cannot be discharged—would rather be than not—for then he would needs be paid. The whole force becomes indifferent and demoralized, as it fears it may be working for nothing, until there may occur, frequently does, open, general insubordination and sometimes destruction of property; when, if the superintendent is not very nervy and discreet, or very cowardly, the wind-up is likely to fall upon him, to his physical injury or total undoing. And all of this, which is outside of legitimate mining, is forced upon him by the home office without apparent care for the outcome.

When a mine is paying well, there is no inquiry as to how it is accomplishing it, and the superintendent is an excellent man, who knows his business; but let

the pay stop, there is mismanagement, he is an ignoramus, and always was.

Conditions are so varied and varying in mining, that results cannot be predicted except with some ifs; consequently, the best of effort and conduct of business frequently ends in failure, while the most slovenly attention to and direction of affairs frequently pays excellently well.

The method of keeping accounts, which I have mentioned, has been quite extensively adopted by San Francisco companies, and were you to devote a page to its illustration you would doubtless confer a favor upon many a mining company. It simplifies the superintendent's accounts to such a degree, each month's accounts closing into "cash balance," that any man, however ignorant of bookkeeping, can see at a glance just what the receipts have been, and from what source, what the expenses of the different departments have been, what for, and what balance is left to the superintendent's Dr. account after closing.

MINE SUPERINTENDENT.

The Bursting of Small Cast Iron Flywheels.

NUMBER II.—CONCLUDED.

The condition of the shaft and hub at the close of the experiment with wheel No. 15 is shown in Fig. 14: a discouraging feature of this sort of work.

The results are summarized in Table V. It will be noticed that the rim speed is about one-half that of a solid wheel, and therefore the centrifugal tension at the joint would be greater than that given in Table V on account of the weight of flanges and bolts. At a rim speed of 100 per second these wheels would have a factor of safety of about $3\frac{3}{10}$, which is altogether too small.

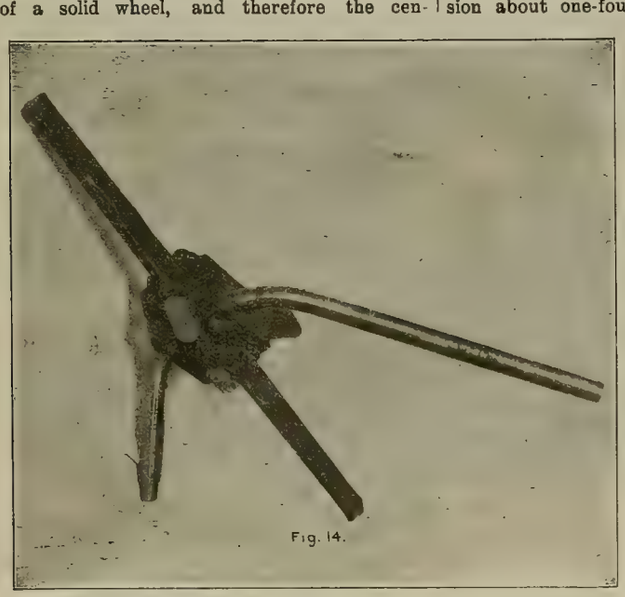


Fig. 14.

TABLE V.—FAILURE OF FLANGED JOINTS.

No.	Area of rim, sq. ins.	Effective area flanges, sq. ins.	Total strength bolts, lbs.	BURSTING SPEED. Revolutions per min.	BURSTING SPEED. Feet per sec. = v.	CENTRIFUGAL TENSION. Per sq. inch = $\frac{v^2}{10}$.	CENTRIFUGAL TENSION. Total lbs.	Remarks.
11	3.18	.....	.....	3,672	385	14,800	47,000	Solid rim.
12	3.85	1.92	16,000	.....	.....	.....	.....	Flange broke.
13	3.85	1.89	16,000	1,760	184	3,400	13,100	Flange broke.
14	3.85	2.58	16,000	1,875	196	3,850	14,800	Bolts broke.
15	3.85	2.34	20,000	1,810	190	3,610	13,900	Flange broke.

Linked Joints.—Wheels numbered 16 and 17 were of the familar rolling mill type, with the joints connected by steel links over cast iron lugs, as shown in Fig. 15, the links being heated and shrunk on. The dimensions of the lugs and links are given in Table VI.

TABLE VI.—LINKED JOINTS.

No.	LUGS. Breadth, ins.	LUGS. Length, ins.	LUGS. Area, sq. ins.	LINKS. Number used.	LINKS. Effective breadth, ins.	LINKS. Thickness, ins.	LINKS. Effective area, sq. ins.	RIM. Max. area, sq. ins.	RIM. Net area, sq. ins.
16	.45	1.0	.45	3	.57	.327	.186	2.45	1.98
17	.44	.98	.43	2	.54	.380	.205	2.45	1.98

BY TESTING MACHINE.
Tensile strength of cast iron = 19,600.
Transverse strength of cast iron = 40,400.
Average tensile strength of each link = 10,180.

Wheel No. 16 had three links to each joint, one on each face and one inside. This wheel burst at a speed of 3060 revolutions per minute, or 320 feet per second. Each joint broke on one side, through the rim, without shearing the lugs or breaking the links, as may be seen from Fig. 16.

In No. 17 the link was omitted from the inner lug, leaving but two links to each joint. This wheel burst trifugal tension about one-fourth. The joints in all the wheels were carefully made, and were at a speed of 2750 revolutions per minute, or 290 feet per second, in the manner shown in Fig. 17. On one side the rim broke as in No. 16; on the other side the lugs failed by breaking off. It is impossible to eay which joint failed first. It is thus seen that No. 16, with three links, broke at a speed 66% in excess, and No. 17, with two links, at a speed over 50% in excess of that of the two wheels with flanged joints.

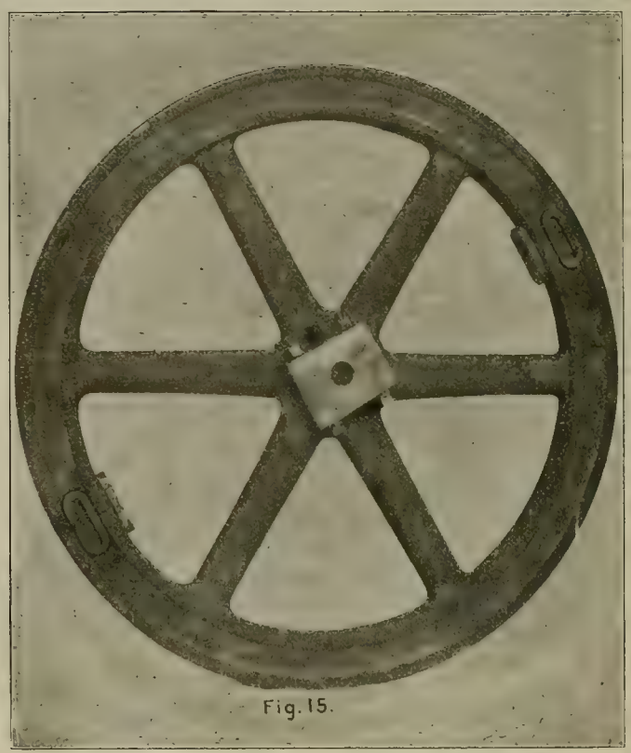

Fig. 15.

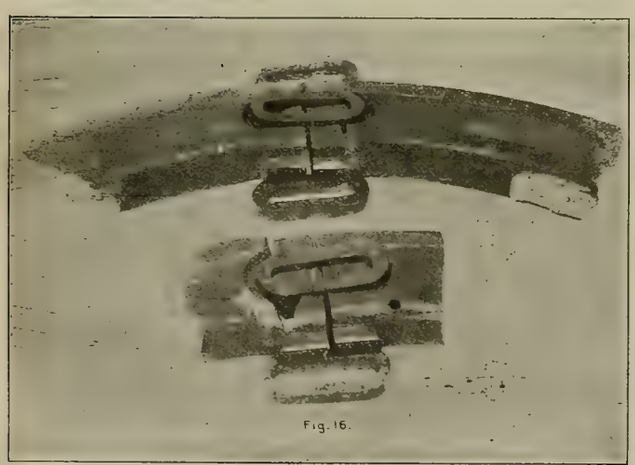

Fig. 16.

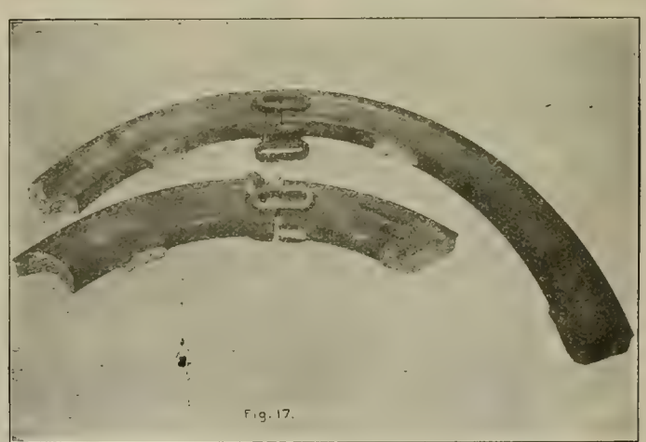

Fig. 17.

TABLE VII.—FAILURE OF LINKED JOINTS.

No.	Strength of links, lbs.	Strength of rim, lbs.	BURSTING SPEED. Revolutions per min.	BURSTING SPEED. Feet per sec. = v.	CENTRIFUGAL TENSION. Per sq. in. = $\frac{v^2}{10}$.	CENTRIFUGAL TENSION. Total.	Remarks.
16	30,540	38,800	3,060	320	10,240	25,100	Rim broke.
17	20,360	38,800	2,750	290	8,410	20,600	Lugs and rim broke.

From the summary in Table VII it will be noticed that the strength of the rim of the weakest section is apparently in excess of the strength of the links, whereas it was the rim that failed in each case. It must, however, be remembered that the links were under direct tension, while the rim was subjected to bending in addition.

At 100 feet per second the factors of safety for Nos. 16 and 17 would be $10\frac{1}{4}$ and $8\frac{4}{10}$, respectively.

Conclusions.—1. Flywheels with solid rims, of the proportions usual among engine builders and having the usual number of arms, have a sufficient factor of safety at a rim speed of 100 feet per second if the iron is of good quality and there are no serious cooling strains. In such wheels the bending due to centrifugal force is slight, and may safely be disregarded.

2. Rim joints midway between the arms are a serious defect and reduce the factor of safety very materially. Such joints are as serious mistakes in design as would be a joint in the middle of a girder under a heavy load.

3. Joints made in the ordinary manner, with internal flanges and bolts, are probably the worst relatively stronger than many joints in flywheels which are running to-day in our mills and shops. The centrifugal tension at the joint would be greater than that given in Table V on account of the weight of flanges and bolts. At a rim speed of 100 per second these wheels would have a factor of safety of about $3\frac{3}{10}$, which is altogether too small.

4. The type of joint exemplified in Nos. 16 and 17 is probably the best that could be devised for narrow-rimmed wheels not intended to carry belts, and possesses, when properly designed, a strength about two-thirds that of the solid rim.

It is gratifying to notice the fact that since the subject of joints in flywheel rims has been so thoroughly ventilated during the discussions before the society several of our prominent engine builders have changed the designs of their wheels by bringing the rim joints opposite the ends of the arms.

The experiments which have just been described, although at times a trifle too exciting, were interesting from first to last. The more this subject is agitated, the less shall we have occasion to mourn the destruction of life and property on account of faults in the design of this most necessary element of the steam engine.

Mining Summary.

ARIZONA.

Near Prescott, J. Berrie has a body of ore in his Lincoln mine in which the pay streak is 20 inches wide and horns about $25 per ton gold. The ore also carries silver. He also has considerable gravel piled up on his placer claim, which he will work when the snow waters come.

On the Kier mine, near Round valley, a shaft is being sunk on a new find of silver and considerable rich ore is being taken out. ——The Empire Copper M. Co., composed of Los Angeles cattlemen, is operating at Empire Flat. Good ledges and a fair grade of ore have been shown up.

In the Mammoth mine, near Tucson, a tramway system has been introduced, effecting a saving of over $100 per day over the former method of transporting the ore. One hundred men are listed on the payroll.——In the Oro mine development work has been pushed. A 600-foot tunnel has been completed and a 340-foot shaft sunk. There was paying ore from the surface, but improved with depth. Last year 4000 tons of the last ore crushed netted $8 per ton. Fifty men are employed.——P. Anderson shipped a carload of ore recently from his Lone Star mine, near Safford. He has a force at work and will make regular shipments.

Mohave *Miner*: C. Gracey is preparing to have erected a 40-stamp mill to treat the ores of El Dorado district. There is sufficient good milling ores ready to supply the new mill.—— At Globe the Old Dominion Copper M. & S. Co. loaded twenty cars with copper, twenty-five tons to the car, which amounts to 1,120,000 pounds, worth $230 per ton, or $115,000 for the entire shipment. This is thought to be the largest single shipment of copper ore ever made from Arizona.

Globe *Belt*: Near Globe, on a group of seven claims of the Beard mine, at a depth of 100 feet, some good ore was struck in a 225-foot tunnel, 15 feet wide, which is said to average from 10% to 15% copper.——In the Finletter claims a 120-foot tunnel is in ore its entire length and the dump averages 6% copper.

Yuma *Sun*: The Rattlesnake mine near Quartzite is yielding some high-grade ore.—— At Fool's Gulch, Yavapai county, in the Planet-Saturn mine a depth of 970 feet has been attained and the ledge, which has not changed for 300 feet, is 3½ feet in width. The ore ranges from $20 to $70. The prospects are that in a short time a 100-stamp mill will be installed.——T. Hamilton of Ehrenburg bonded three claims to H. C. Beaty of Los Angeles, who will pay $1000 in April and $9000 in September. These claims are near Ehrenburg and well developed. The ores, which exist in a large ledge, contain copper, gold and silver. The grade of the ore is said to be sufficiently high to stand shipment and yield a profit. The deepest shaft is 120 feet. Several other shafts have been sunk. The properties will soon be extensively worked.——At the Fortuna mine twenty stamps are propelled by a 90 H. P. engine and crush 100 tons or five tons per stamp per day. Each stamp weighs 1425 pounds, has a drop of 7 inches, at the rate of eighty-one strokes to the minute. As the ore is principally free, when crushed and passed over 100 square feet of amalgamating plate to each stamp, or a total of 2000 square feet, there is but little, if any, free gold left in the tailings. The four boilers which supply power to run the mill, compressor, hoist, pumps and other machinery consume eight cords of wood each twenty-four hours, at a cost of $3.50 per cord. The woods used are ironwood, mesquite, palo blanco and ocotilla. They have attained a depth of nearly 700 feet and have encountered water in such quantity as to require two force pumps to relieve the mine. A cyanide plant with a capacity of 150 tons a day is being constructed. There will be five tanks of thirty tons capacity. In the big bank of tailings are thousands of tons, from which approximately $2,000,000 was extracted during the original working. Preparations are being made for underground water storage and drainage, and when perfected further exploration of the mine will set in. The employes of the company constitute a payroll, amounting to about $9000 each month.——A. R. Fleischmann of Cleveland, O., has men at work repairing the old Senator mill in Lost Basin, Mohave county, and will soon make a trial run. Ore from the Senator mine will be worked and the property be developed to considerable extent.——G. Wores of Tucson sent two 10-mule teams to Red Rock to haul ore from the Doxology mine. He expects to load about a car daily. Several hundred tons of ore are on the dump.——At Mammoth in the Mammoth mine the 600-foot level has been reached and the mill and cyanide plant are in operation day and night.—— At the Mohawk preparations are being made to open up more ground.——The Commonwealth mine at Pearce has increased its large production. The shipments to the smelter continue and a 20-stamp mill has been added to the plant at the mine.——T. Ewing has bonded a group of mines on the Nevada side of the Colorado river, on which he put a force to work.——The Red Rock mine on Big Bug is being worked with three shifts with twelve men. T. Fleming is the owner of the property.——A body of ore has been uncovered in the Prosperity mine Todd basin. The Prosperity is an old producer.

Globe *Times*: The Goswell M. Co. of Tonto are prospecting their mine and have twenty-five men at work.——The Mammoth G. M. Co., on the San Pedro, are reducing 150 tons of ore daily and employ seventy-five men. The company will bring the mill to 100-stamp capacity. The cyanide works are giving satisfactory results. The improvement to be made is that of utilizing the Aravaipa stream for generating electric power for the mills, cyanide plant and hoists. This will be done by harnessing the water, fifteen miles from the works, which at its lowest supply exceeds 2000 miner's inches. It will be diverted from its channel two miles from the power plant and conducted by pipe or canal, whichever is more practical.

Prescott *Courier*: Upon the Shelton, one of the group known as the Clark properties, at Lynx Creek, the hoist is in position, and as soon as surface equipment is complete a start will be made to unwater the workings and begin extensive development of the entire group.——Trayler & Breslin have resumed work on the Star, and have already worked a profitable lot of mill ore.——Algert & Warren, who have a lease on the Pine Mountain, have developed a body of ore in the lower level and are also working over the old dumps.——It is locally reported that J. H. Costello has made a deal for the Milliken and Comer properties for $50,000, and that extensive development will be done on both groups.——A hoist is contemplated on the Amulet, with a view of sinking the shaft 500 feet.——The Favorite has started both levels from the 350-foot station, and also has at 300 feet a body of smelting ore carrying values near $100 a ton.——In the Pride of the West mine, in Washington camp, Pima county, thirty men are employed. The output is about fifteen tons daily. The average ore is 15% copper, 50 ounces silver and 1-10 ounce gold. Another mine in the group, a silver property, on which six men are employed, produces from thirty to forty tons per month. All the ore is shipped to reduction works. The Pride of the West has been a producer for twenty years.——One of the oldest mines of the county, the Belmont, is soon to start up after a shut-down for years. It is owned by the Bacon estate of San Francisco. ——F. Olesen is working the Double Standard and shipping a carload of copper ore a month. ——The Smuggler is operated by a small force. The ore runs about 15% copper.—— The Holland mine and mill, owned by Colorado men, has been temporarily suspended, but it is expected to be operated again shortly with a large force.

CALIFORNIA.

Butte.

Oroville *Mercury*: In the eastern portion of Oroville J. H. Leggett is operating a hydraulic elevator and hoisting gravel 8 feet into sluice boxes. The gravel is scraped into the elevator pit by horses and scrapers.——The dredger on the Mortenson place is nearing completion.

Oroville *Register*: The Gem M. Co. at Enterprise will soon resume operations.——A tunnel is being run on the Red Point mine. ——The Alm Bros. have finished a successful run in the Crystal Peak mine.——A small force is employed in the Denver mine.——In the Big Betsy mine there are men at work. ——In the Carlisle mine the pumps are kept running.

Calaveras.

Grading for the additional 40-stamp mill is completed at the Gwin mine, near Mokelumne Hill. The excavation is to be made large enough for the foundation of a 60-stamp mill, but only forty stamps will be added at present, making a total of eighty stamps.

Angels *Echo*: The Cherokee mine near Altaville, bonded recently to a San Francisco company, is being prospected by H. O. Potts, who has taken out several hundred dollars in specimens.——Improvements at the Gold Cliff mine at Angels continue. The sinking of the shaft goes on night and day, and the building of the car track to the Madison mill is completed.

San Andreas *Prospect*: At the Pine Log mine, near Copperopolis, work is pushed.—— At the Royal mine the shaft is between 700 and 800 feet, showing a ledge which varies in width from 5 to 20 feet.——With a sufficient amount of water, work is being prosecuted at the Green Mountain gravel mine on Tunnel Ridge, near Mokelumne Hill, under the superintendency of J. J. McSorley. To avoid the rim of lava a tunnel for the flume was run to the old works and an upraise run to the surface and the hydraulic plant installed. This gives a clear sweep of gravel, free from lava capping, for several thousand feet. The gravel pays well.——J. E. Burton has resumed drifting for crystals in another portion of the Green Mountain property.

San Andreas *Citizen*: The new mill has been completed at the Thorpe gold mine, near Fourth Crossing, and thirty stamps are dropping day and night. About sixty men are employed. W. L. Honnold is Supt.

El Dorado.

The Zentgraf mine, near Newcastle, is adding five stamps to the mill, making twenty-five in all. The shaft is down 900 feet, and the drifts from the 500 to the 900 levels are being extended.——Development work is in progress on the Francis mine, near Georgetown. A ledge has been struck which prospects well.

Placerville *Democrat*: At Slate Mountain, on the Independence mine, drifts have been run on the ledge, which is 24 inches wide and is said to yield $50 a ton.——J. C. Heald has commenced unwatering the old Montezuma mine at Nashville.——Wm. Lupold is running his mine at Brownsville steadily. The arrastra is going on high-grade ore.——J. Fuller, at Brownsville, has begun to rehabilitate the old Richmond and Syracuse mines. Men were put to work cleaning out and unwatering with a view to deeper workings.

Inyo.

The copper mine at Ubaheba has a tunnel 75 feet, all in ore. A shaft has been sunk 37 feet in the ledge. The ore is of good quality. Sufficient water can be had by piping.

Kern.

Randsburg *Miner*: The new mill on the Yellow Aster mine at Randsburg will be started up the 12th inst. The Yellow Aster people stopped shipping ore to Barstow on the 6th. More ore has been shipped this past month than any other previous one. The pipe line to carry the tailings from the new mill to the reservoir, 2700 feet, is being put in. It is a 5-inch, of capacity to perform the service of 100 stamps.——The Eureka mill made another cleanup of a month's run and shipped about $800 of bullion last week.——Bentley & Wynn bought a two-thirds interest in the Battle quartz mine at Randsburg and will soon erect machinery and develop the property. There are about 700 feet of development work, showing a large body of low-grade ore to pay expenses of development.——Last week a strike was made in the Annex mine of a 20-inch vein of $100 rock.

Madera.

In Coarse Gold district a good vein of quartz has been opened in the Washington mine, owned by Van Timmons & Lathrup. The ore carries gold in fair quantities and is free milling.——At Grub Gulch the Gambetta M. Co. have added to their force and are doing extensive work.

Mono.

At Bodie the Standard Con. Co.'s new mill was started last Thursday night and is working well.

Napa.

The quicksilver shipments from the local mines for January were: Napa, 601 flasks; Ætna, 300; Great Western, 89; Vallejo, 17; total, 1007—an increase of 46 over December.

Nevada.

The Cabbage Patch M. Co., composed principally of residents of Grass Valley, contemplate erecting a 10-stamp mill on their property soon.

Grass Valley *Union*: E. Creller will begin operations soon at the mine which he recently bought on Union Hill. He will thoroughly develop the property.

Nevada City *Transcript*: The dam being built to divert water into the Texas M. Co.'s ditch is nearly completed. It is built of rocks and logs and is 112 feet long and 8 feet high.

Placer.

The reservoir at the Big Dipper mine, in the Iowa Hill mining district, broke last Thursday night and carried away the mill, blacksmith shop and drying house. Five Chinamen and one white man, Joseph Farber, were killed. Their bodies were found several miles down the canyon. The loss to the mine will be $12,000.

Colfax *Sentinel*: At Dutch Flat the gravel in the Oak & Cedar tunnel, operated by S. C. Jordan, is showing some good prospects.—— The Polar Star mine, owned and operated by Wm. Nicholls Jr., started up last week with twenty-five men and two monitors with a capacity of 1000 inches of water each. The material washed is heavy and the dam in Bear river holds it all.——Work has begun on the Crandal mine near Auburn by Hartley & Freeman, and they expect to have a 5-stamp mill running March 1st.

Sacramento.

Near Walltown Mrs. Sinclair is developing a quartz claim in which the miners last week found some high-grade ore.—— The big dredger will be launched this week.——A. J. Smith has installed a pumping plant on Sacramento bar and is also sinking a number of prospect shafts. If the prospects prove favorable another dredger will be built by Colorado men.——Several hundred acres of gravel deposits have recently been bonded along the river, mostly on the Natoma grant, with the ultimate view of building dredgers thereon. It is locally reported that the entire Natoma vineyard has been bonded by a company with the ultimate intention of dredging the gravel deposits for gold.

San Bernardino.

The Anita M. & M. Co. at Ontario contemplates the installment of a stamp mill and other machinery on the company's property. (This company's property is in Sonora, Mexico.)

Los Angeles *Review*: Near Danby, A. W. Warwick is working ten men at his group of mines, developing water, preparatory to putting up a 10-stamp mill.——The Rosalind mine, owned by W. H. Gafford, has a 1½-foot ledge. He is developing the claim and has an 80-foot tunnel and a 40-foot shaft. Some good ore has been taken out.——The Brooklyn is owned by Sutter & McCarthy. It has a ledge 100 feet wide; the pay streak which is being worked is 2½ feet wide. The last assay of the rock was $42.50 in gold.——In the Pioneer mine, near Warwick's Camp, they are sinking. The ledge is 1½ feet wide and the ore assays $67.50 per ton.——The Chicago, at Sheep Camp, is having work pushed. The shaft is on an 18-inch ledge.——The Victoriales, owned by McGarry & Co., is worked by two shafts and a tunnel. Last week a pay streak was struck in one of the shafts which assayed $4.25 in silver and five ounces gold.——The Silver Wave, at Sheep Camp, owned by Smith & Jones, has four tunnels each over 100 feet long. The ledge is 3 feet wide. Considerable of its ore has been worked at Kingman, Arizona. Some picked ore from this mine ran 1200 ounces in silver and $60 in gold.——The Parowan mine, owned by R. McArdle, shipped three tons of ore which netted $300.——The Pandora, at Sheep Camp, owned by J. Huntsman, is now being worked. There is a shaft on it 30 feet deep. Two tons of ore shipped from this claim yielded $396 in silver and $97 in gold.——The Crystal Salt Co., which controls some 14,000 acres of a salt deposit on the salt marsh, thirty-three miles from Danby, has just finished assessment work on the property. The company has a macadamized road to the marsh on which they operate a traction engine, which hauls their output to Danby, their shipping point on the Santa Fe railroad.—— Shields, Burg & Jenkins are working the Goldstone group.——Work continues on the Winchester mine, at Gannous Camp.——The Daggett mine, in Bethune canyon, in Old Woman's mountains, is showing well.

San Diego.

The cyanide plant at the Stonewall mine is ready for work.—— Near Descanso G. W. Marsh and others are developing a vein of gold ore.——An option has been given English people on some of the Laguna property for $50,000.

Shasta.

Redding *Free Press*: Rich ore has been struck in the Sam Houston mine in Old Diggings district. It is owned by San Francisco people and is under the management of J. H. Morton.

Shasta *Courier*: At the Mt. Shasta mine, near Shasta, the station on the 200 foot level has been completed and drifts started north and south. Drifting and stoping are also being done on the 120-foot level. Sinking the shaft to the 300-foot level will be pushed and stopes opened on the 200-foot level. The last 50 feet of the shaft has been in 2 feet of high-grade ore, and the ledge at 14 feet from the 200-foot level shows 3 feet of ore. Six teams haul ten tons of sacked ore from the mine to the Keswick smelter. The property has recently been incorporated under the name of the Mt. Shasta Gold Mine, Ltd.

Sierra.

Downieville *Messenger*: The E. Lewis mine near Downieville has recently become free from all litigation and the company will begin development work with the opening of the season. The company owning this property was recently incorporated under the laws of Utah as the Otsego G. M. Co.

Siskiyou.

Yreka *News*: At the Eastlick & Wright mine at Oro Fino, owned by the Risdon Iron Works Co. of San Francisco, they are piping day and night.——The Blue Gravel mine at Greenhorn is running drifts.——The Salmon River Hydraulic M. Co. has fifteen men employed. They are piping night and day with two giants at the Kleine mine at Sawyer's Bar.——The Last Chance mine near Yreka will be unwatered within ten days.——The Montezuma river claim at Callahan's is being worked with a full force.——At the Hungry Hill mine twenty-five men are employed night and day.——Work is advancing on the Golden Star mine. The tunnel is in 600 feet.——The Aromas Co. has sixteen men employed.——Ten men are at work on the Knownothing mine at Forks of Salmon. Some fine ore is being stoped from the lower level. As a general average, the rock goes $40 a ton.

Yreka *Journal*: The Sheba M. Co. mill near Yreka was started last week and works well. The quartz is high grade.——A. Brokaw has started work in the old Campbell claim at Quartz valley with good success.——The Jillson & Co. quartz ledge near Henley continues to pay.——The Cherry Hill quartz mine at Cherry Creek, owned by Hunter & Co., is yielding high-grade quartz. The mill will be started soon.

Trinity.

Weaverville *Journal*: J. E. K. Lennox near Lewiston is developing a quartz ledge that is 6½ feet in width. The ore is free milling and also carries silver and copper, showing $31 in gold and $15 silver to the ton.

Tuolumne.

(Special Correspondence).—The Mack Con. G. M. Co., reported incorporated in your columns last week, is actively engaged in developing the old Mack and Wooten mines. The office of the company is Room 905, Claus Spreckels Bldg., S. F. Its attorney is Edgar D. Peixotto.

Boston information says that the San'a Ysabel mine near Quartz should earn $15,000 to $20,000 net per month, and after $100,000 has been accumulated in the treasury ($40,000 now on hand) dividends may be looked for.

Jamestown *Magnet*: Near Columbia, Smith & Jones purchased the Byer & Hastings claim and are pushing work.——Sinking continues on the Mountain Lily mine.——The Winnie claim, at Saw Mill Flat, has been bonded to Los Angeles people, who will begin work on it.——Dady & Harris, at Red Gulch, are developing a high-grade milling ore.——A tunnel is being run on the Standard mine and good ore taken out.——H. Gale is making good progress in his property on Union Hill, near Columbia.

Sonora *Democrat*: At the Big Oak No. 1 work is progressing, the heavily-sulphuretted vein holding its average width of 7 feet. The 10-stamp mill placed on this property recently is nearly ready to begin crushing. The old 5-stamp mill keeps at work, and soon the two, making the plant a 15-stamp affair, will be in operation. No. 2 is being developed by sinking, drifting and stoping.——At the Arbona work is confined to drifting at the 300 level, at which point the vein is large and a good body of ore in sight. In the bottom of the shaft, 335 feet deep, the rock looks well; sinking will be resumed shortly. Although having plenty of ore on hand, the company has decided not to start up the mill until certain of a full supply of water, so that the stamps can be kept dropping the entire year.——At the Lilian mine crosscutting is going on and considerable surface prospecting is being done. The rock mills satisfactorily, and in a few weeks drifting will begin. It has now a total length on the vein of 100 feet.——The Excelsior shaft is down over 180 feet.——At the Turner Flat gravel mine a full force is employed and the output is satisfactory.—— Driving the tunnel on the North Star will soon be resumed.

COLORADO.

CHAFFEE COUNTY.

From the Sedalia mine about ten tons of high-grade rock are sent daily to the Argo smelters and the same amount of lesser grade to the Buena Vista Smelting Co. Three new ore bodies recently discovered give employment to forty men.

CLEAR CREEK COUNTY.

W. P. Jennings, near Silver Plume, is developing a quartz property that carries high-grade values. Near Georgetown, B. C. Carton, Jr., expects to put in a plant of machinery on the Smuggler property and sink a shaft at the mouth of one of the adits. He has driven these levels on the vein for hun-

dreds of feet, and disclosed mineral bodies of 2 feet in width and entirely smelting ore. About 150 tons of the smelting ore is moved each month. He is also taking out 100 tons of smelting ore per month from the Dunderberg. The ores run in lead and silver.——The new ore strike in the Aliunde is 1000 feet below the surface. Shipments that are being made run $240 per ton, with 12% lead.

The Annetta Co. on the Griffith mine near Georgetown ships from 175 to 200 tons of ore a month. Four levels are being driven, three of which are in ore and the fourth soon will be. The ore body has been opened up 300 feet. It varies in width from 12 to 30 inches.

Idaho Springs *Gazette*: The 850 level on the Aliunde shows a vein 6 inches thick that is high grade. In addition there is a 3-foot vein carrying mineral, which is sorted. A recent millrun of the sortings returned over 400 ounces silver to the ton.——The Stevens mine is turning out galena that is seamed with ruby silver.——In the Dunderberg mine near Silver Plume the ore carries values in silver, gold and lead, the principal being silver. It is worked on the lease and contract system, the company paying to the lessee a certain amount of footage for driving the drifts, and then giving him a lease on the ground at a reasonable royalty. At present seventy-five men are at work, most of whom are on ore. The output will average 100 tons per month, all smelting ore.—— The Smuggler-Union, owned by B. C. Catren and B. C. Catren Jr., produces ore which carries gold, silver and lead, some ore having been mined that ran as high as eighty one-hundredths of an ounce in gold in a millrun of 10-ton lots. This is a new property. The owners are pushing development work and are opening up good bodies of ore. The present showing is sufficient to keep a force at work for several years. The owners intend, as soon as spring opens, to put a hoisting plant on the property and to sink below the present levels, which are all worked through a crosscut tunnel. They intend to put in a compressor and sink a shaft with power drills, from which levels will be run. They are working thirty-five men on the property. The output will average 150 tons per month. The ore is good grade.

EL PASO COUNTY.

At Cripple Creek it is stated that a local sampler last week paid the Isabella Co. $98,000 for ninety tons gold ore. Ninety tons were since sampled which will return practically the same values. None of the metallic gold found recently has yet been shipped.

The Pride of Cripple Creek mine, a full claim on Bull Hill, was sold to an Eastern company last week for $60,000, a partial cash payment being made. Several shipments of high-grade ore have been made from the property. It is fairly well developed. There is one shaft 300 feet and a number of smaller shafts, two of which have recently been started. It is the intention of the new owners to do a large amount of development.——A profit of $25,383.33 was earned during December by the Creston G. M. Co. of Cripple Creek from their lease on the Jack Pot.——The Vindicator mine will show a heavy increase both in tonnage as well as value in 1899 over 1898. The output last month from the company's workings and ore shipped by lessees averaged 100 tons a day, and this production will be increased. More ground is being opened up and the ore bodies are lengthening and widening. Keith & Grube are sending on an average of thirty tons per day from their block of ground, and when stoping is started in the second level the tonnage will be doubled.—— The output from the Last Dollar last month was twenty-three cars of cyanide ore and seven of smelting grade.——The Lillie is outputting at the rate of forty tons per day.

In January the Cripple Creek district's production was nearly 35,000 tons, with a bullion value of over $1,500,000. Returns from the smelters show that the output of $100 ore reached 8500 tons, making $850,000. The mills and reduction plants handling Cripple Creek ores treated 25,900 tons, with a bullion value of $658,000. The returns reported by the managers of these institutions are as follows: Gillett Reduction Co., chlorination process, treated 2600 tons of an average value of $30 to the ton; gross bullion value, $78,000. Colorado Ore Reduction Co., both chlorination and cyanide, treated 2300 tons of an average value of $25 a ton, representing gold values of $57,500. The El Paso Reduction Co. at Florence, chlorination, handled 3300 tons, with an average value of $25; total, $82,500. The Metallic Reduction Works, Florence, cyanide, treated 8000 tons, averaging $20 a ton; total, $160,000. The Brodie mill, cyanide, treated 2200 tons averaging $25; total, $55,000. Colorado-Philadelphia Reduction Co., Colorado City, chlorination, 7500 tons, averaging $30 a ton; total, $225,000. Stamp mills and small treatment plants in the district are put down for $15,000 in addition to the foregoing figures. Summarized, the production of the district is as follows:

	Tons.	*Value.*
District mills	7,100	$ 190,500
Florence mills	11,300	242,500
Colorado City mill	7,500	225,000
Smelters	8,500	850,000
Small treatment plants and stamp mills		15,000
Total	34,400	$1,523,000

Victor *Record*: C. Johnson, lessee on the Half Moon of the Matoa Co. at Victor, will produce ore from that property to the expiration of his lease, three months from Feb. 2nd, with an output of from thirty to fifty tons a day.——The Finn Leasing Co. sent out a 30-ton shipment last week from the Morning Glory No. 2, which ran from four to five ounces to the ton. The Boyd lease on the south end of the claim recently completed a 45-ton shipment of 2-ounce ore.——The May Queen Leasing Co. made a 15-ton shipment of 2½-ounce ore.——Graney & Cameron, leasing on the Blue Bird, shipped eleven tons of ore running thirteen ounces to the ton.——The Tanna lease on the Mary McKinnie marketed two cars of ore last week of two grades, seven and one-half and two and one-half ounces to the ton.——The Howard lease on the same property marketed two cars of 4-ounce ore this week.

FREMONT COUNTY.

The miners at Dawson City have formed a mining district called the Greenhorn Mining District, fixed the daily wage at $3, and agreed that no assessment work should be contracted under $25.

GILPIN COUNTY.

The Fisk mine, near Black Hawk, is giving employment to sixty men and continues to produce daily about fifty tons, which is nearly all milling ore. The mill ore runs a little over three ounces gold per cord, the concentrates netting from $15 to $20 per ton. The production of smelting ore from this property averages from thirty to fifty tons per month, of a desirable grade. The ore is taken out of the tenth and eleventh levels.——Sinking at the Cook mine has been stopped temporarily for want of water. The working force has been decreased to seventy-five men. Instead of twelve drills running, there are only four at work.—— For January the shipments of smelting ore and concentrates from the Black Hawk depot of the Colorado & Southern road were 276 cars, or 4868 tons—an increase of 36 tons over the same month last year.

GUNNISON COUNTY.

The Maid of Athens mine near Pitkin is but a year old, and with less than 1000 feet of development is said to have exposed a large body of ore. The vein is 7 to 24 feet wide, with 1 foot of the wall that is mineralized, which is shipped as ore, and all the crevice filling is shipped. Galena occurs running 60% lead and 700 to 1300 ounces of silver. The general run of the ore returns an average of $25 per ton, including a few dollars of gold. The property produces ten carloads a day.

The Lily and Silver Cord lodes, at Gunnison, are being operated under lease. About 300 tons of ore are on the dump which is being treated by the local custom mill.——The concentrating mill in Gunnison is treating about thirty tons daily. This mill has all it can do and saves most of the values in the low-grade ore of the camp.——The Lead King mine of Crystal River district was recently bonded to an English company for $100,000; $5000 was paid thereon last week.

The Denver *Record* says that the Venable M. Co. has begun operations on a group of claims in Goose Creek district. The ore runs from $13 to $37 in gold, and the company intends to develop to the depth of 500 feet.

LAKE COUNTY.

Leadville *Miner*: At the Moyer shaft of the Iron-Silver Co., Leadville, the station pump is making but fifteen strokes per minute. The January output of iron sulphides from the Moyer was above 6000 tons. One hundred men are on the payroll. The ore carries a heavy percentage of iron.——The recent discovery on the Hibernia mine shows indications of making a steady shipper. The output at present is twenty-five tons daily of high-grade silver-iron ore which carries thirty-four ounces silver and 45% iron excess, and the lessees are reaping their reward for their pluck and enterprise.

The Boreel and Marian deep sulphide mines, Leadville, worked through the R. A. M. shaft, will make an output this month of more than 6000 tons of iron sulphides. In addition to this a large amount of prospecting by drifting and diamond drilling is under way. Seventeen teams are employed moving this tonnage. The grade of the ore continues good, and the large iron excess in this material makes the smelter charges low.

MINERAL COUNTY.

Creede camp starts the new year by shipping 7580 tons of ore during January, and the mine owners predict that the month of February will see an increase over January.—— In the Bachelor mine, which is being worked in blocks by leasing companies, both the ore and employes are increasing.——The Nelson tunnel has been driven through the New York-Chance grounds and within 400 feet of the Last Chance shaft house, a distance of 6100 feet. The tunnel is being driven on the vein and will drain all of the large mines on Bachelor mountain without further connections. The water in the Last Chance is now sinking at the rate of 4 inches a day.

PARK COUNTY.

At Alma the Hill Top M. Co. recently bought the Fulton and Emily lode mining claims, which join their property, for $32,000. The money is to be paid at the rate of $1000 per month for thirteen payments, and the fourteenth payment of $19,000 is to be paid Jan. 1, 1900, or, if the Hill Top Co. fails in this, they are to have another year to finish paying an additional $8000. The first payment was made in December.

IDAHO.

Press dispatches state that a company headed by J. W. Mackay and E. J. Mathews have bought the White Knob copper claims. The capital of the company is $5,000,000, in shares of the par value of $100. The company is in operation and will push the sinking of the main shaft, which is down over 500 feet. The company is equipped with smelting facilities which can work fifty tons per day. During the summer there will be shipment of bullion from surface ores. The engineers' report shows this to be one of the finest prospects in the country. The outcroppings are large. They show 3% to 35% copper and carry gold and silver.

Press dispatches state that the Buffalo group of claims, in the Buffalo Hump camp, has been sold to F. L. Clark and C. Sweeny of Spokane for $650,000. The property is undeveloped.

W. H. Butters & Bros. have purchased the Red River meadows, near Elk City, and are putting in a chain-bucket dredge to handle the gravel.

At Hailey the agreement between H. C. Lewis and S. E. Rigg for the Crœsus group of mines is filed for record. Rigg paid $5000 cash and is to pay $10,000 June 1, 1899, $35,000 Oct. 1, 1899, and to make final payment of $30,000 May 1, 1900.——The Wildcat group of mines was leased last fall by Earhart & Co., who began work on a 500-foot tunnel to drain the workings and for cheaper development. This tunnel at 280 feet penetrated into quartz and tapped the lupper works. The shaft was free of water. At the bottom of the shaft they found a vein that assayed $90 in silver and 72½% lead per ton.

Wallace *Press*: C. Manley and associates, owners of the Black Horse mine, in the silver-lead belt near Murray, shipped two carloads of ore. They estimate that they have 900 tons of ore on the dump, mostly of a concentrating quality, which at the present price of lead will pay to ship without much sorting. ——The Standard M. Co. have begun the foundation for their new hoist, which will have a capacity of 2500 feet. The machinery cost $21,000.——A carload of ore was shipped from the Barton mine near Murray last week. ——Three pounds of gold dust were brought to Cœur d'Alene from Potosi last week.—— The Myrtle Co. will begin work as soon as the water starts this spring. The water will be plentiful for extensive placer mining.

Florence *Miner*: Two and a half feet of high-grade ore is reported in the Hiyu mine near Florence at a depth of 80 feet below the first level. The shaft is going down at the rate of a set of timbers for every two shifts, and is 100 feet below the first level. Sinking will continue to 200 feet below the first level.

MONTANA.

The Eclipse Con. M. & M. Co., operating near Saltese, is shipping ore of high grade. The company owns twelve claims. The depth reached is 165 feet. They have 38 feet of shipping ore which many tests have proved will average $45 per ton. The ledge is 180 feet wide on the surface, where it is iron-capped. The Northern Pacific is putting in a spur to accommodate the mines of the camp. The company is developing its properties with the proceeds of the sale of ore taken out in development.

The Bear Gulch M. Co. in Park county has been giving employment to fifty men all winter. It has been operating its 20 stamp mill and has arrangements completed to increase the number of stamps to sixty before spring opens. The company has been shipping concentrates to East Helena.——Mr. Schaeffer of Butte, who has a lease and bond on the Myhres mine in the Amazon district, has taken the water out of the 100-foot shaft and reports a 4-foot body of good ore, from which he expects to make shipments soon.

The tunnel on the Connon property is in 243 feet with the vein opened up for 92 feet. The vein is from 1 to 3 feet thick and gives assay values from $50 to $75 a ton in lead.

Burbach & Lueck, leasing on the Navahoe mine near Virginia City, recently encountered an 8-inch body of high-grade gold ore in the 90-foot level from which they are making a 12-ton shipment to Butte.

M. J. Miller of Chicago, has taken a lease on the Kennett mine near Ennis and proposes to do considerable development work. The Kennett is owned by W. B. Millard of Omaha, who constructed a 60-stamp mill and expended about $200,000 in development work. The Kennet has been worked from time to time for the past thirty years and is one of the oldest properties on the Tobacco Root Range.

Winston *Prospect*: D. Slavens made a shipment of two cars of ore last week from his recent strike on the Eclipse property near Winston. The mine is producing ore from a 14-inch vein at the rate of three tons a day.

Neihart *Herald*: At the Queen of the Hills mine near Neihart Supt. Nelson has been driving work for sixteen months, employing twenty-five men. They have averaged for 1898 about five cars of ore per month. A recent strike of good ore is reported in the 300 level of 18 inches.——After long idleness the Galt mine has opened up again. They are taking out ore, employing ten men.——The Moulton Co. at Barker owns four claims in one group. A tunnel 1232 feet in length has lately been completed on the Moulton, attaining a depth of 356 feet. This vein was last summer under lease by the United Smelting & Refining Co. of Great Falls, and over 3000 tons of ore were extracted. At places the ore body was solid galena 7 feet in width. About 900 feet from the entrance they found a ledge of oxidized iron 40 feet in width which contains some silver and gold.——The Wright & Edwards is working fourteen men. The shaft has been sunk 317 feet and at 300 feet a crosscut to the ledge is begun. This mine is under lease to the Great Falls smelter.

Philipsburg *Mail*: After several years of patient endurance, word has been received that operations will soon be resumed on the properties of the ill-fated Golden Scepter Co. J. R. McDonald, promoter of the Majestic M. Co., has been engaged for some time in an effort to float sufficient bonds to realize $300,000 —this being the amount required to complete and start the works—gives out the information that the necessary funds are secured and that work will resume not later than April 1st. It is believed that the mines at Quigley are among the valuable gold properties known, and, while the ore is of a low grade, it is free milling and exists in immense quantities, which permit operations on a large scale. The expense of mining the ore at the Jumbo mine is light, as it can be quarried without handling any waste. The entire works will be operated by electricity. The enterprise is among the largest undertaken in this State.

NEVADA.

Recently a force was put to work in the Star mine, at Cherry Creek, putting in place the air compressor and connections to work the power drills. When completed a big force will be put to work in the mines.——The total bullion output of the DeLamar mines in '98 was divided as follows: DeLamar, $6,141,834; April Fool, $517,968. The DeLamar property, from a prospect when bought by Capt. DeLamar up to the present time, has placed millions of pounds of machinery, building material and piping, which was hauled from the railway at Milford, 160 miles, for putting in the mill, which has a capacity of 350 to 400 tons a day, and for several pumping stations and pipe lines from ten to thirty or more miles each. Fuel has added great expense to the plant.

From the Golden Eagle mine, near Winnemucca, the hauling of ore, which had ceased because of bad roads, began last week. The mine has considerable shipping ore exposed, while ore of good milling quality has been followed all the way down the shaft. During the past ninety days over 300 tons of good milling ore has been added to the large amount already on the dumps.——The deal for the Ophir property, near Stateline, has been closed to B. Springer and associates of Salt Lake, who take possession immediately and put on a full force. It is stated that the purchasers propose to put in a mill to treat the ores of their property, as also the other silver ores of their camp.——The Young America, at Tuscarora, has passed to Heinrich, Brown & Dern. The estimated price is $60,000.

The bill fixing the State tax levy at $1 on the $100 for all taxable property, including mines and mining claims, has passed the Legislature.

The directors of the Con. Cal. & Va. M. Co. have authorized Supt. Kervin to start work to flood out the fire smouldering in the stope timbering on the 1650 level. He will lay a line of iron pipe to convey the water from the discharge column of the Risdon hydraulic plant to the seat of the fire and its ultimate conveyance to the drain flume in the north lateral branch of the Sutro tunnel. The Risdon plant will raise at least 10,000,000 gallons of water every twenty-four hours, in addition to the 100 inches required to operate the plant. The area to be flooded is 900 feet long by 200 or more in width, and extending 200 feet or more downward.

On the Comstock last Sunday the Risdon pump was lowered into the C. & C. shaft. The pump was attached to the hoist cable and lowered in that way, about 70 feet of the cable being doubled over to make the lowering safe.

The Risdon Iron Works now expect to start pumping the water into the drain flume of the north lateral branch of the Sutro tunnel by next Wednesday. The heavy valve part of the machinery is in place, the elevator has been lowered into the water and the discharge pipe leading up to the Sutro tunnel connection laid.

The following ore shipments were made from Eureka the week ending Feb. 3:

Mine.	*Pounds of Ore.*
Altoona Mining Co.	30,200
Diamond	34,750
Eureka Con.	89,530
Jackson	96,310
Richmond	38,180

At the Searchlight, Lincoln county, in the Hopkins group of mines fifteen men are employed; they have on the dump 500 tons of gold ore that will average $25 per ton in gold. It is the intention to put up a mill on the west side of the Colorado river, about ten miles from the mines; the haul is down hill. F. W. Dunn is Gen. Mgr.

The DeLamar *Lode* says that work on the Boston and DeLamar group, formerly owned by Nichols & Griffiths, embracing fifty-two acres in Ferguson mining district, will be carried on in an extensive manner.——A contract has been let to San Francisco people to resume work in the Numa mine, near Winnemucca. The shaft is down 220 feet and will be sunk to greater depth. At the same time a drift will be run above water level. When operations ceased twenty-five years ago it was claimed that the hanging wall contained an 8 inch streak of high-grade ore.

Winnemucca *Silver State*: H. H. Beck has sold the Reno Reduction Works to people of Boston, represented by C. Williams. The transfer is to be made as soon as the matter of detail can be arranged. The purchasers paid part cash. They will operate the reduction works in connection with a group of mines they own near Oreana, in Humboldt county. The shipment of ore will begin soon. The mines are gold, silver and lead.

NEW MEXICO.

At Santa Rita Gilchrist & Clark are working thirty miners on their leased ground at the Cortez mine, and large bodies of high-grade ore are extracted.——Jones & Dawson have ten miners employed on their leased ground on the Rita mine and are taking out good pay ore.——F. P. Jones has twenty-five men employed on his lease on the Romero mine. He is taking out good copper ore.—— H. W. Dawson, on the Iturbide, is working under lease. His ore runs 24% copper and 20% iron.——A. E. Dawson, Gen. Mgr. Santa Rita Copper & Iron Co.'s mines, is shipping five cars of iron ore per day to Pueblo, Colo.——At Central, in the Texas mine, the drifts on the 500-foot level are showing good bodies of ore, and the mill is turning out high-grade concentrates every day.——A. L. Shaw has bonded the St. Helena mine for ninety days for $25,000. This mine shows a vein of gold ore which yields $30 a ton.

The Garfield & Butler claims, at Hillsboro, are making regular ore shipments to the smelters. The property is operated through a 450-foot tunnel, which shows a vein varying from 4 to 7 feet in width, with a pay streak that yields $50 per ton.

At Kingston the Illinois mine is being worked by six sets of leasers, who are shipping ore.——The property shows 6000 feet of development.——The Kangaroo, which has been idle a number of years, will soon be reopened. It is developed by a 300-foot shaft. ——The Calamity is a constant producer and is being worked under two sets of leasers. The values range from 28 to 200 ounces in silver.——J. Hurst is working the Maplewood. The vein is 3 feet thick and the values run

25 ounces in silver, $3 in gold, 5% lead and 3% copper.——The Cumberland will soon resume work. Kansas City capitalists have the property under bond.——The Black Colt property is worked under lease and high-grade ore is being taken out. The mine shows 2000 feet of development.——The Gipsy group of seven claims is a silver property. It is a comparatively new mine and the development work consists of a 200-foot shaft and about 500 feet of drifts. The vein is 20 feet in width. The high-grade ore which is shipped returns 150 ounces in silver and from $8 to $10 in gold. The low-grade ore will be concentrated. It returns from 20 to 35 ounces in silver per ton. One car recently shipped ran 363 ounces in silver and $18 in gold.

OREGON.

(Special Correspondence).—A vein of lignite coal has been opened on Powder river, near Sparta, twenty miles from Baker City, and on the line of the Baker City & Seven Devils Railroad. The coal has been satisfactorily tried for heating and blacksmith work.

Baker City, Feb. 6th.

The Columbia mine, near Baker City, is employing twenty-eight men, doing extensive development work and shipping concentrates.

The Cable Cove properties, the Owl and Elephant claims, near Baker City, owned by K. P. Plowman, have been bonded to the Twin Springs M. Co. for $70,000, and extensive development of the mines has been arranged. The Twin Springs M. Co. is backed by the Stetson Hat Mfg. Co., and is the same company that recently purchased the Deer Lodge mine, Baker City, for $100,000, and upon which large development operations are under way.

Baker City *Democrat*: The Golconda mine at Susanville, in the 600-foot tunnel, has a pay streak ranging in width from 4 to 16 feet carrying values from $10 to $70 per ton.——A second run of thirty tons of ore from the Carroll B mine, in Pleasant Valley district, owned by Johns & Baisley of Baker City, will soon be made at the Virtue mill, preliminary to extensive development of the property and the early erection of a mill if ore values warrant.——In the North Pole mine has been found a ledge about 6 feet in width of high-grade ore. They are in on the tunnel 1300 feet. As they can only treat twenty-two tons per day, a larger plant is contemplated.——The Baisley-Elkhorn mine employs sixty men; most of the work is at the 500 and 600 foot levels and seventy-five tons of good ore is daily taken out.

Grant's Pass *Journal*: Near Cottage Grove a new strike has been made in the Helena mine, which is said to be of good values.——Near Grant's Pass, Mr. Sturgis has struck a quartz ledge 2½ feet wide that assays $24 a ton.——A. W. Sturgis, near Jacksonville, is piping off considerable ground.——The Black Butte quicksilver mines, near Bohemia, made their first shipment of quicksilver last week to New York. The shipment contained thirty flasks.——At Althouse the Hickox mine is running night and day.

Jacksonville *Times*: The Hansen mines in Althouse district will soon be in operation.——California people have taken charge of the Hammersly mine in Jump-off-Joe district and are unwatering the property.——The placer mines of Pleasant Creek precinct have a fair supply of water. About twelve mines are operated with hydraulic plants.——Four mines are operated with hydraulic plants on a large scale in Wolf Creek district.

SOUTH DAKOTA.

The Portland & Clinton M. Co., operating at Portland, is shipping eight cars of ore per day from the Portland mine, and the Clinton ships three cars every other day, making the daily output of the two mines nearly 100 tons. About fifty men are employed in the two mines.

UTAH.

The shipments of ore and concentrates from Park City last week were 2,291,150 pounds.——At Vernal, it is locally stated that negotiations are pending for the sale of the Bromide mine and smelter to New York capitalists who have secured an option on the property for $75,000.——At Tintic in the White Star mine quartz has made its appearance which is of good value in gold.

The report recently submitted by Mgr. Dern for the Mercur M. Co. shows the receipts from the sales of ore and all other sources for the year reached a total of $481-161.23, with the expenditures amounting to $280,766.97, leaving net earnings in the sum of $200,394.26. On Jan. 10th there was a balance of $178,972.10, making a total of $379,366.36. Of this amount $355,000 was distributed in dividends, leaving a balance on hand Jan. 12th of $24,366.66. The production during the year reached a total of 105,188 tons gross that, less the moisture, showed 90,461 net tons. The net saving was $5.31 per ton in gold, with the cost per ton of $2.23. Of this latter item $1.16 was expended for mining, $1.72 for milling, and 35 cents for transportation. —— In the strike in the Star Consolidated at Tintic last week over 5 feet of ore has been exposed, the samples from which show 38% copper, twenty-nine ounces silver and 80 cents in gold.—— The Mammoth at Tintic found ore that shows four ounces in gold in addition to other metals per ton. The find was made last week in the 700-foot level.

Tribune: The Monitor mine near Milford this week shipped 200 tons of gold-bearing ore to Salt Lake.——A new cave was opened in the old Cave mine at Minersville recently in which it is reported a body of high-grade carbonate ore is exposed.——In Beaver county more activity is visible in mining than has been in many years.——Near Park City, the Superior Con. groups, held under lease by E. P. Le Compte, are being developed by eight men. Before Le Compte took the property there had been driven a tunnel 1300 feet in length, which at 1000 feet cut a vein 5 feet in width, which was never prospected. The ore assays from twenty ounces silver, 32% lead, to ninety-eight ounces silver, 60% lead and $6 in gold.

Salt Lake *Tribune*: The shareholders of the Daly-West M. Co. last week agreed to the amendment looking to a consolidation of the long divorced interests. The property is at Park City. The number of shares are increased from 75,000 to 150,000; the capitalization from $1,500,000 to $3,000,000. Recent proceedings will now be followed by a meeting of the board of directors representing the parent company, which will pass on the title to the outstanding half of the property which proposes to come in. If the title proves sound the secretary will issue 75,000 shares of stock to J. B. Haggin et al. Upon the execution of deeds conveying to the company their one-half interest in the twenty-eight mining claims in the possessions of the Daly-West. In the meantime preparations all point to the active resumption of work by March 1st. It is reliably stated that within a few days of the start-up the property would be providing employment for 325 persons between the mine and the mill and that the value of the milling ore blocked out is $3,000,000 and of the shipping ores now in the bins and started in the drifts underground at $150,000.——Last week John Dern and associates acquired the Nora group of mining claims at Mercur. The purchasers will at once undertake its systematic exploration.——At Mammoth recently on the 500-foot level in the Lower Mammoth the ore chute that was encountered originally at a depth of 300 feet has been broken into which gives over 200 feet of stoping ground. The shipping of ore was resumed last week. ——The Red Wing mine of Bingham made another strike of ore that runs well in copper, with silver and gold.——At Diamond a strike in the Joe Bowers Extension shows an ore body off the 270-foot level, where 8 inches of galena is exposed.——Operations will be pushed on the properties of the Butler Co. at Bingham in which G. S. Peyton and S. L. Boggs have recently become heavily interested. The Butler has a tunnel 250 feet long and another 500 feet long. In one of these was encountered a vein 18 inches wide carrying gold, silver, copper and iron. Four hundred and fifty feet in the tunnel was struck a 4-foot vein of gold, silver and lead. These veins afford high-grade shipping ore and it is expected that shipments will soon be made. The 500-foot tunnel is to be extended.

In the Old Jordan separated from the silver-lead chute by a sheet of limestone is a ledge that will average 5% copper and $5 gold. The values contained in the galena ore will afford a margin 40% greater than is to be derived from the copper body.——The Petro M. Co. of Bingham will resume operation of the property. This is another of the number that were driven out of the business when the slump came in the metal market, and while the owners have since added largely to their ore reserves, practically nothing has been sent to market for years. The lead bodies are said to be among the largest that have been uncovered in the State.

The Malvern M. Co. will continue further development of its ground at Sunshine and work is to be resumed as soon as it is possible to organize a force and reach the camp with supplies.——Several carloads of first-class ore were last week shipped from the Saratoga, of the Boston Con. group at Bingham.——The Tiewaukee group of fourteen claims, having recently passed to the control of W. S. McCornick, was last Saturday leased to A. D. Beeman, who is now putting the property in shape preparatory to doing a large amount of development work in new ground.——Copper ore is being produced from the lower workings of the Maxwell group.——The Old Telegraph shipped eight carloads of ore last week from Roman Empire, Grecian Bend and Carpenter Shop tunnels, leasers' ore.——This week the Dewey mill handled about 200 tons of ore from the Red Wing.——Since the 13th, 600 tons of average grade lead ore has been marketed from the Spanish mine at Bingham.

The Northern Light mine at Mercur last week marketed ore showing 409.6 ounces silver, 12.5% lead and $8 in gold, amounting to $5100.——The Galena M. Co. of Fish Springs last week made a shipment of ore that showed 81 ounces silver, 48.5% lead and 60 cents in gold. Another car of similar quality is en route.——Lower Mammoth last week shipped a car of ore giving a percentage in copper in addition to the other metals, of which assays show 109 ounces silver. The output will be 100 tons a month.

WASHINGTON.

Illustrating the activity in the formation of mining companies, etc., the following list is published of the new mining incorporations at Olympia for last week, an average six days: Republic Giant G. M. Co., Spokane, $100,000; Karchers M. Co., Tacoma, $1,200,000; Elaine M. & M. Co., Spokane, $9000; Columbia M. Co., of Buffalo Hump, Spokane, $100,000; Northern Lode of Buffalo Hump Mines Co., Spokane, $100,000; Spokane Copper M. Co., Spokane, $100,000; Republic Iron Mask G. M. Co., Spokane, $100,000; Gold Crown and Gilt Edge Con. M. Co., Spokane, $25,000; Alpine G. M. Co., Spokane, $100,000; Buffalo Clearwater Con. M. & M. Co., Spokane, $75,000; Jubilee G. M. Co., Spokane, $100,000; Little Tom Thumb M. Co., Spokane, $50,000; Windfall G. M. & M. Co., Spokane, $100,000; The South Half M. Co., Spokane, $100,000; Cumberland G. M. Co., Spokane, $100,000.

A carload of ore shipped to the Selby smelter from the Sapphire, Slocan district, runs 160 ounces silver and 70% lead. Regular shipments will be made.

Wm. Pinnell, formerly an employe at the Everett smelter has been adjudged insane. He stole about $500 worth of silver and gold, combined in one brick of bullion. He had an idea that he knew a secret process by which he could separate the metals. He was arrested for grand larceny, but the officers became convinced that they had an insane man instead of a thief to deal with. One of his pet schemes is to build a smelter in Everett. He says he is going to be a rival of John D. Rockefeller.

The Twin and Lily K. claims on Pass creek near Grand Forks have been bonded to C. D. Porter and associates of Spokane for $50,000, upon which $ has been paid down. These claims have a large surface showing, the width of the ledge being from 80 to 100 feet. The pay chute, where uncovered by surface cuts, measures from 25 to 30 feet. The values run from $ to 10 copper, $4 to $10 in gold and some silver. Some assays have gone as high as $64 in gold per ton. Contracts for two 50-foot shafts have been let, one to be sunk on each claim. The price to be paid for these two claims, practically undeveloped, is on account of their surface showing. —Near Republic the Georgie Reed has a body of ore that assays $27 per ton. The ledge is 30 feet wide

At Republic the Republic mine last week in No. 3 tunnel found 4 feet of ore that assays $225 per ton. A drill on various properties for miles along the ridge is boring through the porphyry and country rock prospecting for ledges.— —The Mountain Lion tunnel has been driven 800 feet. At a distance of 750 feet the ledge was cut. The average assay runs $60. The ledge matter is about 43 feet wide.

At Republic the Butte & Boston tunnel is in 213 feet. The rate of progress is 3 feet per day of three shifts.——The Golden Harvest tunnel is in 456 feet. A winze has been started in the ore chute. The ore shows uniform values.

FOREIGN.

BRITISH COLUMBIA.

The Deer Park mine at Rossland has opened a large body of ore from which two carload shipments have been made. The dump of shipping ore contains over 1000 tons. This is being added to merely in the course of development. —— The Canadian Pacific is handling eight carloads of silver-lead ore a day from the mines of the Slocan.——Two concentrators will be built at Sandon in the spring, one for the Ruth and one for the Ivanhoe. —— The Vancouver M. Co. and the Waverley, both near Silverton are erecting concentrators. —— Shipments of ore from the mines of the Rossland camp for the week ending January 28th were: Le Roi, 1500; War Eagle, 600; Iron Mask, 20; total, 2120. —— The Darby M. Co. recently bought the Swansea property in East Kootenay for $30,000. The principal values are copper and gold. Work will be commenced as soon as conditions are favorable.

The Cariboo mine in Camp McKinney, head office at Toronto, owns a group of seven claims and is developed by a shaft 360 feet, with levels at 70, 175, 255 and 355 feet. Most of the stoping has been done between the second and third levels. The new company is driving development. The equipment consists of a new 10-drill compressor, two 60 H. P. boilers and a 60 H. P. hoist capable of sinking 1000 feet. The mill is of 20-stamp capacity and crushes forty tons a day, and the ore plates $17 in gold and yields $2 in sulphurets. The concentrates run on an average about $80 per ton, they have on hand over 200 tons of concentrates; the company employs fifty men. ——The Anarchist, Explosion, Dynamite and Success mines were recently bonded for $25,-000 to Toronto people. Numerous surface cuts on the lead expose it for 4000 feet. The ledge shows a width of 6½ feet and at the bottom 5¾ feet. The values run $16 a ton.

The Porto Rico mill, near Nelson, is turning out $20,000 a month, and it is locally stated that the capacity of the mill will be doubled.

The Gertrude mine at Rossland is to be equipped with a new power plant. Work in shaft has been hindered by the rapid flow of water and to carry on development without delay the management has decided to install machinery. A pump and a hoist will be utilized and perhaps drills. The shaft on the Gertrude is down about 150 feet and it is to be carried to 200 feet, when crosscutting in both directions across the claim will be undertaken.

The deepest shaft ever sunk in Caribco for placer mines was put down last summer by R. H. Campbell of California in what is supposed to be the old ancient channel of Horsefly river at the head of Beaver Lake valley. This shaft was bottomed on rim rock at a depth of 450 feet with good prospects, $2 and upwards to the pan. The company is now sinking a three-compartment shaft, 5x15 feet, more in the center of the channel.——The Cariboo Con. Hydraulic Co., Ltd., did some more ditch work last year, constructing another one ten miles in length from Morehead creek at a cost of $125,000. The company has now about thirty miles of ditching to its mine which will give in the future sufficient water to last the season. This company cleaned up for a short season's run last year $110,000, and expects to double that in '99.——The Golden River Dam Co. on the south fork of Quesnelle river completed its dam to hold back the water of the South Fork lake.

On the Molly Gibson property in the Slocan a body of ore at 150 feet depth, from 1 to 6 feet wide, said to average 550 ounces silver and 50% lead per ton, has been struck. Six carloads of Molly Gibson ore have already been shipped, giving a net return of over $125 per ton.

The ore shipments from McGuigan, in the Slocan, for '98 were 934 tons.——The Bosun shipped 120 tons in January.——Five carloads of ore were shipped by the Dardanelles last month.——The Ymir mine has a combination 40-stamp mill concentrator and will soon be treating 100 tons per day.—— The Le Roi mine at Rossland has shut down shipments for ten days, pending the completion of the skip from the 700 to the 800-foot level. The shaft between these levels is practically completed. There is merely a pillar of rock left under the skip at the 700-foot station. Ore chutes, pumps, rails and air pipes are being put in. After the completion of the shaft full work will be resumed and shipments will continue at the rate of 200 to 300 tons a day. The shaft will be deepened to 900 feet. An electric hoist will be erected. The size of this new plant is not decided on It will probably be not less than 100 H. P.

The Hall Mines, Ltd., expect to start treating lead March 1st.

MEXICO.

A newly discovered vein of iron, lead and silver, in the San Lorenzo Sierra, near Cuencame, will be opened up and known as the Parida mine.— A vein of zinc, silver and gold ore was discovered recently near Zacapoaxtla, and work is progressing on the property. The new 100 ton furnace erected by S. A. Barron, in the Magistral district, is in operation and smelting 130 tons every twenty-four hours.

During 1898 there was done in the Creston mine at Minas Prietas about one and three-fourths miles of new development work.

The Susie is a new mine of antimony and the Maria one of copper denounced near Tlacotepec, in the State of Guerrero, by F. C. Burgdorfer. —The gold mine of Kraft & Anderson, near Chihuahua, is a heavy shipper. The ore goes to the smelter at the rate of 100 tons per day; it is manganese oxide and carries gold.

THE PHILIPPINES.

A California miner, now a soldier in Manila, writes of the mineral resources in the Philippines, saying: "Nearly the whole island of Luzon contains minerals of many kinds, gold, silver, copper and coal being chief among those found in appreciable quantities. So far the greater part of the work done on quartz has been on the small veins, carrying rich pockets and yielding indifferent general results. Some spasmodic attempts have been made by stock companies to mine quartz, but as yet I have been able to learn of no proposition that has been free from the stock gamble and where the mining was capably and honestly carried on. The Indians (Igorotes) sell yearly a large amount of placer gold of fair quality to itinerant traders. I am credibly informed that with wooden bowls they produce about $500,000 yearly from the sands of the provinces of Cayagan, Ilocos, Abla, Boutoc and Benguet. Many idols and ornaments of pure gold, of native manufacture, have been shown me. But the excessive greed and corruption of Spanish officials of these islands have made everything like continuous mining, even by the wild tribes, precarious and well nigh impossible. It is my honest belief that if American occupation holds, many profitable ventures may be made in placer mining, for nearly all of the streams of the northern part of Luzon are auriferous and have an abundance of water and wood and effective fall."

Commercial Paragraphs.

JEANESVILLE IRON WORKS CO, Denver Branch, A. Middlebrook manager, received an order this week from St. Louis, Mo., for one of their improved sinking pumps, No. 9 B; also shipped one of the same size to New Mexico. Their shops are very busy on mine pump work.

MESSRS. E. H. BENJAMIN, mining engineer; A. M. Hunt, mechanical and hydraulic engineer, and Wynn Meredith, electrical engineer, have formed a copartnership with headquarters at 331 Pine St., San Francisco, and are prepared in their respective lines to make expert examinations, furnish advisory reports or supply competent construction supervision.

THE Vulcan Iron Works Co. of Seattle, Wash., expect to be settled and ready for business in their new quarters by the 15th inst., and state that after that date they shall be pleased to receive all interested at the new plant, which will be by far the most complete and best appointed and equipped in the Northwest. It will be thoroughly equipped with new machinery of all classes, and its capacity more than five times larger than at the old plant. The Vulcan Iron Works Co. of Seattle propose to make a specialty of mining machinery and engine building and will also be prepared to manufacture all other classes of machinery.

Recently Declared Mining Dividends.

Pennsylvania, California, 5 cents per share, $3000; payable immediately.

Swansea, Utah, $5000; Feb. 10.

Gold King M. Co., Colorado, 1 cent per share, $10,000; payable Feb. 20.

Deer Trail No. 2, Washington, $2500; payable immediately.

Ruth mines, British Columbia, 22½% per share; Feb. 1.

Recent Mining Incorporations.

California M. Co., San Rafael; capital stock $100,000, subscribed $160; T. W. Tompkins, M. Gottschalk, W. M. Byrnes, H. Wilkius, J. W. Cochrane.

Tiger Fork Placer M. Co, San Jose; capital stock, $17,500—subscribed; S. P. Sanders, J. H. Miller, J. F. Jury, W. B. Sanders, N. A. Sanders.

Longfellow M. Co., S. F.; capital stock, $100,000; subscribed, $2500; E. Anderson, R. W. Dron, C. P. Eells, H. L. Atkinson.

Obituary.

At Trail, B. C., Jan. 31st, J. E. Boyden, master mechanic for the Trail smelter and superintendent city electric plant, was killed by a shock received while working at the switchboard; 500 volts passed through his body.

Industrial Notes.

—The Northern Pacific Railroad is advertising Hawaii.

—Spokane, Wash., made half a million barrels of flour in '98.

—New and important oil strikes are reported at Summerland, Santa Barbara, Co., Cal.

—During last month 1406 passengers and 6160 tons of freight went to Alaska via San Francisco and Seattle.

—The Mexican Coast Steamship Co. is announced ready to ply between southern California ports and points on the west coast of Mexico.

—Approximately, the total area of the railway belt in British Columbia is 10,985,738 acres, and the area of the part of the belt surveyed by the Dominion Government is 834,140 acres.

—The world's shingle packing record was broken recently by H. Tritz of Pilchuck, Wash. He packed 1000 in 8 minutes and 5 seconds. The record heretofore was held by F. Tocbed of Wisconsin.

—The Copper River & Yukon Railroad Company ask Congress to grant them $16,000 per mile subsidy, rights to incorporate for fifty years, and right of way for a railroad and telegraph line from Valdes Inlet, Alaska, to the Klondike.

—At Colon several of the strikers have returned to work as a result of the railroad's notification of an increase of 25 cents silver in the rate of wages. The strikers at Panama still refuse to go to work and the deadlock there still continues.

—Internal revenue receipts at San Francisco for January amounted to $249,706, about double the sum received during the same month of last year. The customs receipts for the port during January amounted to $541,212, as against $499,268 for the preceding month.

—The U. S. shipping interests of the Hawaiian Islands have greatly increased since annexation. There were last week at San Francisco loading for or on the way to the Islands fifty vessels, of which thirty-five fly the American flag, five British, three Norwegian and two German.

—Baker City, Or., has planned to bring water from mountain streams by a ten-mile gravity system to cost $140,000, to raise which the city would have to be bonded. In one of the 200-foot artesian wells, having a 6-inch pipe, 85 feet of 1-inch pipe was inserted, and, by a small air compressor, the flow from this one well was increased one-third.

—Over $1,000,000 of the recent issue of $1,500,000 State of Jalisco, Mexico, 6% gold bonds have been sold since the bonds were brought out at par and interest about a month ago, showing how radically the recent war has changed sentiment in respect to securities outside the United States. The price of the bonds has been advanced to 102.50 and interest.

—J. A. Scrymser, president of the Pacific Cable Co., arrived from Hongkong and Yokohama, thinks that no American cable could land in the Philippines or on the Asiatic coast without the consent of the English companies, which have controlling contracts with the different governments, some of which run till 1949. The Japanese Government is willing to go into the proposition under certain conditions.

—Tacoma, Wash., reports the purchase of the Tacoma street railways for nearly one million dollars by a New York syndicate, the consolidated street railways of that city, to be operated by the Tacoma Railway & Power Co., now being organized with $2,000,000 capital, about half of which is to be used for the construction of a electric power plant, water power to be derived from the White, Puyallup or Nisqually rivers.

—Los Angeles, Cal., hears of two banking firms which have formed an American company, contemplating the purchasing of all the beet sugar plants west of the Mississippi river; capital stock, $20,000,000. It is thought there that the beet sugar plants which the company will take are those at Grand Island, Neb.; Norfolk, Neb.; Chino, Cal., and Huename, Cal. The last named is the big factory at Oxnard in Ventura county.

—The three steamship companies sending vessels from San Francisco across the Pacific are giving present preference to freight waybilled through from the East, and local shippers find it difficult to get any freight space at all. Having worked up the trade they now find themselves virtually excluded. The remedy, of course, is to establish another line. The business justifies it.

—C. N. Sterry, the solicitor of the Santa Fe in California, is essaying the passage of a law to permit the Santa Fe Pacific—from Albuquerque to Mojave—to consolidate with the Southern California railroad and the Valley road. It is considered to be the intention of the Santa Fe to combine all of its lines west of Albuquerque into one company, with general headquarters in San Francisco. Officials of the Atchison Co. deny the report from San Francisco, which states that a deal has been concluded between the Santa Fe and the North German Lloyd Steamship Co., by which the latter will operate a Transpacific line before the first of next year.

—The following, in reference to the food supply in South Africa, is taken from the report of J. G. Stowe, U. S. Consul-General, dated Cape Town, November 30, 1898: "It was stated in a recent debate in Parliament here that in America wheat was $1.86 and flour $2.61 per 100 pounds; that a large fall in prices was expected, and that American flour was being adulterated. As an example of the present high cost of living here, it was said that an employee of the railroad, married and with three children, draws £12 ($58.40) per month; that he was obliged to expend for food not less than £7 10s ($36.50) per month, and for rent a minimum of £4 10 ($26.50) per month, thereby using up all his wages, leaving nothing for clothing or education. Flour is coming now from the United States. This latter article, now regularly imported, is in heavy demand, with inadequate supplies. Shipments on the sea are sold, and this month's imports are large. Quotations are 18s ($4.59) per sack of 196 pounds.

—The U. S. Treasury and War Departments will build a trail and wagon road from tide water to the Yukon river, entirely upon American territory. The southern terminus of the road, an all-land route to the Yukon valley, will be Valdez, on Prince William sound. From that point the road will pass to the west of the glacier of Copper river, following the contour of the country to Montasta pass, at the head of Tanana and Forty-mile rivers, 1600 feet high. Thence the road will follow Forty-mile creek and end at Eagle City, on the Yukon, just inside the American line. This route makes the road 400 miles long, all on land.

—An experiment concluded recently at Marysville, Cal., by Dr. F. A. C. Perrine of Leland Stanford University, utilizing the electrical power line of the Yuba Power Co., from its power house to Brown's Valley, a distance of ten miles, is said to have demonstrated that 36,000 volts may be transmitted over a copper wire, using glass insulation, against 16,000, which has been the maximum in power transmission heretofore. Such a commercial result would effect a saving of half in the cost of wire in the construction of electrical transmission plants in the future. As it is now, the cost of wire is about half the entire cost of the plant.

—At Vancouver, B. C., it is stated that the banks have shut down on twenty-eight canners in British Columbia owing to their inability to carry on business under the present Dominion regulations. Three bank managers are quoted as saying that with the present regulations canners cannot can and all the smaller concerns must go to the wall. It means a loss to the province of $4,000,000, and to Vancouver alone of $500,000. G. I. Wilson, the largest individual canner on the Fraser, is quoted as saying: "I have sold two of my canneries in Canada and am looking for a site in the United States. About twenty of the fifty canneries will move to the States should the blundering Canadian Government insist upon enforcing the regulations with the idea of barring American fish and fishermen. The rest will go out of business."

—The Anglo-American commission, laboring for reciprocity between this country and Canada, find coal, lumber, wood pulp and agricultural products all serious stumbling blocks. The Canadian representatives of lumber interests say the Americans have offered to reduce the tariff on lumber to one dollar, but that their commissioners are stoutly holding out for absolute free trade. The Canadian commissioners have disavowed the British Columbia parliament action and agreed to give the Americans the same privileges in the Atlin district as Canadians are given in American territory. Should there be no convention as the result of the commissioners' labors, then the American Government will ask the Dominion Government to set aside the obnoxious British Columbia alien mining law, which might create trouble between Americans and Canadians in the Atlin district.

—Consul Thackara at Havre, France, writes: "In conversation with an American lumber broker of Havre, J. N. Chrystie, 57 rue St. Quentin, he informs me that he has made several attempts to sell cargoes of California redwood for foreign account in France, but so far has been unsuccessful. Three difficulties stood in the way: 1. The price wanted by the American exporter has always been a little higher than the French importers could afford to pay. Twelve pounds ($58.39) per St. Petersburg standard (165 cubic feet)—say, $29 per 1000 square feet—is as much as the importer could offer this year c. i. f. Havre. 2. The voyage from the Pacific being a long one, the terms—2% discount for cash, payment on date of arrival (freight deducted)—were held out for by the French importer, the American exporters' terms being four months from date of bill of lading. 3. The smallest vessel which could be chartered was of a capacity of about 60,000 square feet, and this seemed too much for a trial shipment. Fifty thousand square feet would be ample, as the wood is not generally known. If these difficulties could be surmounted, Mr. Chrystie is under the impression that a market for California redwood could be built up. The sizes wanted are 8 inches full in thickness (as wood of this thickness and above is admitted free of duty), 14 feet and upwards in length, and 12 inches and upwards in width—the wider the better. If the wood is 1 centimeter less than 8 inches in thickness, it most certainly will have to pay customs duties; so I say 8 inches full. It should be clear stuff."

Catalogues Received.

Catalogue "A," issued by the Vulcan Iron Works, 505 Mission St., San Francisco, Cal., illustrates and describes the Vulcan single and double tramway system, the single-carrier trolley lines, the double-carrier reciprocating gravity tramway, and, in general, surface haulage plants and rope-power transmission. Especial attention is given to detailed description and illustration of the Vulcan double-rope tramway, and on pages 27 and 28 is a series of questions upon the answers to which can be given estimates of what such work would cost in any special case. Catalogue "B" is specially devoted to description of the single-rope system. Those interested in aerial transportation can secure a copy upon request.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DESIGN FOR HORSESHOE PAD.—Edward D. Flint, Oakland, Cal. No. 30,095. Dated Jan. 31, 1899. This invention comprises an improved design for elastic pads to be used in conjunction with horseshoes and provides a better and more convenient support between the shoe and the hoof of the horse.

ADJUSTABLE HINGE WINDOW.—Wm. McCall, San Francisco, Cal., assignor to the McCall Sliding Hinge Window Co. No. 618,608. Dated Jan. 31, 1899. This invention relates to windows and is applicable in part to ordinary windows having slidable sashes, but is especially adapted for use upon that class of windows in which the sashes are hinged upon one side to a strip which is slidable on vertical guides. It consists of a hollow metallic parting strip having outwardly turned edge flanges, similar flanged plates secured to the frame exterior to the line of travel of the sashes and plates fixed to the edges of slides to which the sashes are hinged, these plates traveling beneath and being guided by the flanged plates and parting strip.

ADJUSTABLE FAIR LEADERS.—Wm. F. Murray, San Francisco, Cal. No. 618,607. Dated Jan. 31, 1899. This invention relates to that class of gear known as "fair-leaders," which are designed for the change of direction of ropes so that they may lead in any direction and retain the directing pulley fairly or in direct line in both directions therefrom. It comprises a globe having a slotted central opening for the pulley, a pin passing through the globe and forming an axis or shaft upon which the pulley is turntable and a two-part socket partially enclosing the globe having the periphery of the globe fitted within it and means by which the parts of the socket are adjusted with relation to each other to clamp the globe and thereby fix the position of the pulley.

SIGNAL CONTROLLING TRACK INSTRUMENT.—E. A. Holloway, Gilroy, Cal., assignor of one-half to F. U. Reeve. No. 618,604. Dated Jan. 31, 1899. The object of this device is to provide a means for giving a signal such as is required when trains approach railroad crossings or other points where it is desirable to notify a distant point of the approach of the train. It comprises insulated track sections over which the train passes successively, wires connecting said track sections with a battery and with electro magnets, which are successively energized by the passage of the train, latches whereby metallic connection is made through the magnets one after the other, an electrically controlled signal apparatus which is energized after the second electro magnet is energized and its connections made, and a third electro magnet and disengaging bar, the whole device being acted upon by the passage of the train over the track sections so that the magnets, being successively energized, will first operate the signal and lastly restore the parts to their normal condition in readiness for the passage of another train.

FISHING REEL TENSION APPARATUS.—A. V. Chapin, Ferndale, Cal. No. 618,599. Dated Jan. 31, 1899. The object of this improvement is to provide a varying tension upon the reels used by fishermen so that the line may be allowed to run out more or less freely as desired. It comprises a connected pawl and ratchet mechanism by which the reel is turnable to wind or unwind a line and an intermediate device by which the tension upon the unwinding line may be varied independent of that upon the line when it is moving in an opposite direction.

TRUNK LASHING.—Jas. Cameron and W. E. Link, San Francisco, Cal. No. 618,598. Dated Jan. 31, 1899. The object of this invention is to provide a lashing for trunks which is cheap, readily applied and effective, and which will present no especial incentive to dishonest persons to take it off and steal it in transit. It consists of ropes passing respectively longitudinally and transversely across the bottom, their junction being connected, thence up the ends and back strap, loops through which the meeting portions of the ropes are freely movable at points where they are contiguous to each other upon the top of the trunk, flat wire links to which the ends of the ropes are secured, and straps fixed to one pair of the links adapted to pass through the other pair over and over, whereby a purchase is provided to tighten the lashing.

APPARATUS FOR EXTRACTING METALS.—Philip Somerville, Bishop, Cal., assignor to the California Agitating & Leaching Machine Co. No. 618,622. Dated Jan. 31, 1899. This invention relates to an apparatus for extracting metals from their ores, and it is capable of being used for separating coarse from fine material. The invention comprises essentially a frame or support, one or more rotatable barrels mounted therein having spiral flanges fixed to the interior extending from one end to the other, the screen extending longitudinally through the flange, an inlet at one end of the barrel and an outlet at the opposite end, and devices at the inlet end for feeding material and fluid matter to the barrel. This applies to the uppermost when two barrels are employed, and with this construction a device serves to deliver the material from the discharge end of the first barrel by gravitation into the receiving end of the other barrel, by which it is again returned to the front by the spiral of this barrel.

Personal.

J. GRIFFITH becomes Gen. Mgr. Boston & DeLamar Co., at DeLamar, Nev.

WM. MCKINLAY, Supt. Providence mine, Nevada City, Cal., is in San Francisco.

J. F. WEBB of Placerville, Cal., will make his future headquarters in Denver, Colo.

T. E. SCHWARTZ becomes Gen. Mgr. Moyer mine, of the Iron Silver Co., Leadville, Colo.

F. E. WARE, San Francisco, Gen. Mgr. Mt. Shasta mine, Shasta, Cal., has returned from the mine.

DAVID SWICKHEIMER and A. J. Clark of the Japan Mines Co., Telluride, Colo., are spending the winter in Los Angeles, Cal.

G. A. RICE of Denver, Colo., has returned from New York to Esmeralda county, Nev., where he is sampling a copper property that he has had under development for some months.

THE California State Senate has granted Lieut.-Gov. Neff, president of the California State Miners' Association, leave of absence from the State for six months. It is his intention to make a visit to the Hawaiian Islands.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JANUARY 31, 1899.

618,556.—BOILER—A. Bink, Stockton, Cal.
618,598.—TRUNK LASHING—Cameron & Link, S. F.
618,599.—FISHING REEL—A. V. Chapin, Ferndale, Cal.
618,405.—BOTTLE—S. Erstad, Bisbee, A. T.
618,669.—POP CORN GEM MACHINE—J. E. Harvie, Los Angeles, Cal.
618,462.—WINDOW—E Hipolito, Los Angeles, Cal.
618,604.—TRACK SIGNAL—E. A. Holloway, Gilroy, Cal.
618,691.—BICYCLE GEAR—C A. LaGrave, Carson, Nev.
618,608.—WINDOW—W. McCall, S. F.
618,426.—CAN OPENER—E. D Middlekauff, S. F.
618,515.—MOP WRINGER—Emma E. Miller, Sac'to, Cal.
618,607.—FAIR LEADER—W. F. Murray, S. F.
618,724.—SAND PAPERING MACHINE—A. A. Pelton, Spokane, Wash
618,481.—FEATHER RENOVATOR—W. W. G. Reed, Los Angeles, Cal.
618,622.—EXTRACTING METALS—P. Somerville, Bishop, Cal.
30,095.—DESIGN, HORSESHOE PAD—E. D. Flint, Oakland, Cal.
30,113.—DESIGN, ESCUTCHEON PLATE—B. Phelps, Seattle, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

POSITION WANTED by experienced cyanide man as superintendent of a mill or as assayer and chemist. Technical graduate. Will take charge of a cyanide proposition for a small salary with a percentage of the profits. Address S. C. M., care of Mining and Scientific Press, San Francisco, Cal.

WANTED — POSITION BY A CHEMIST, ASSAYER and MINING ENGINEER.
Cyanide a specialty. Speaks Spanish. First-class references. Address Box 28, this office.

WANTED — ASSAYER AND ANALYST DESIRES POSITION.
Experienced and reliable. Excellent references. Address COMPETENT, care of Mining and Scientific Press.

PRACTICAL ASSAYER
WANTS POSITION. Many years experience in mill work in wet and dry mills, and in gold and silver amalgamation. Address J. C., Assayer, Mining and Scientific Press Office.

WANTED.
Capital to Handle Extensive Gold Mines.
JAMES ARTHUR, Cornucopia, Oregon.

WANTED.
Position as Superintendent or Assistant Superintendent of Copper Mining and Smelting Works.
Competent Smelter, Assayer, etc. Understands handling men; speaks Spanish; willing to go to Mexico or South America; best references. Address COPPER, this office.

WILL PAY CASH ON ACCEPTANCE AFTER EXAMINATION.
COPPER PROSPECT—No development required other than surface cuts, showing width of ledge between walls. Address No. 26, 320 Sansome, S. F.

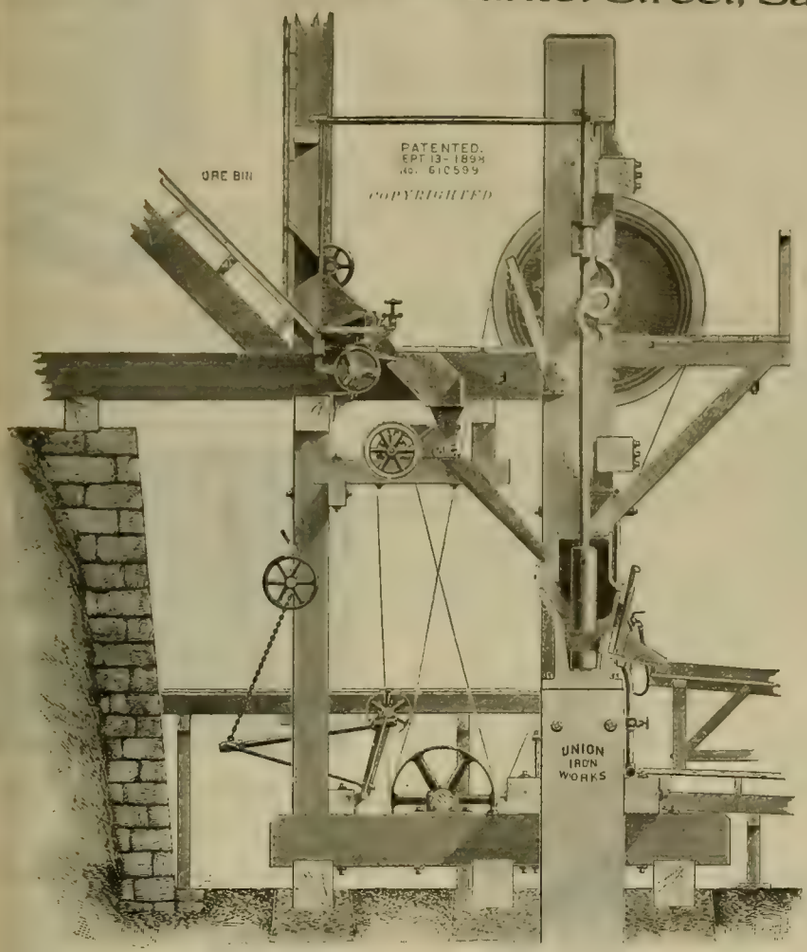
E. H. BENJAMIN, Mining Engineer.
A. M. HUNT, Mechanical & Hydraulic Engineer.
WYNN MEREDITH, Electrical Engineer.
EXPERT EXAMINATIONS. ADVISORY REPORTS. CONSTRUCTION SUPERVISION.
331 Pine Street, ... San Francisco, Cal.
Telephone Main 1870. Cable Address "Edben."

DIAMOND DRILL
FOR SALE,
OR CAN BE HIRED, TOGETHER WITH EXPERT TO OPERATE IT.
Apply to J. A. MURRAY, care of Risdon Iron Works, San Francisco.

..CRIPPLE : CREEK..
FOR SALE—CYANIDE PLANT,
100 tons daily capacity; in first-class condition to handle Cripple Creek ores.
Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

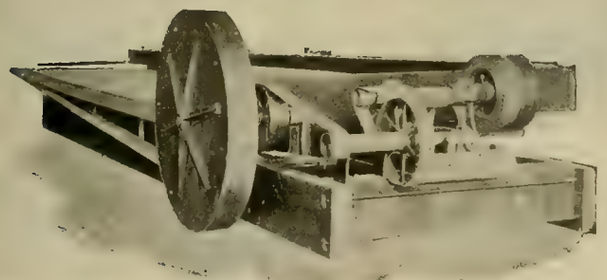
WHITE, ROGERS & CO.,

Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

3

JONES HAND POWER ROCK DRILL.

The ONLY SUCCESSFUL and Practical Hand Drill Ever Offered.

THE EDWARD P. ALLIS CO.

DESCRIPTIVE CATALOGUE SENT ON APPLICATION.

Milwaukee, Wis.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

Professional Cards.

R. A. Perez, E. M., Mgr.
124 South Main St., - Los Angeles, Cal.

ALMARIN B. PAUL, M. E.,
ROOM 27, CROCKER BUILDING, SAN FRANCISCO.
Will act as AGENT for the sale of RELIABLE Mining Property. Miners having mines sufficiently developed to warrant works, and disposed to convey interests, for machinery of class and capacity as mine will justify, may be benefited by submitting propositions, with description of property.
Will act as agent for Eastern parties owning mining interests in California.

W. J. ADAMS, E. M.,
Mining Engineer and Metallurgist.
Graduate of Columbia School of Mines.
Twenty years' practical experience.
Specialty, Gold Ores.
Address, Room 15,
132 Market St., San Francisco, Cal.

O. H. PACKER, E. M., Mgr. Heald's Mining School.
F'm'ly Asst. U. S. Govt. Chemist at World's Fair.
MINES EXAMINED FOR OWNERS AND BUYERS ONLY.
Reports guaranteed correct. Have personal surveying, chemical and assaying outfits.
24 Post Street.....San Francisco, Cal.

JOHN W. GRAY,
Mining and Hydraulic Work.
Prospecting Operations and Exploration Work.
Examinations, Surveys, Development, Equipment of Mines, Gold-Bearing Gravels, and Water Supplies.
923 Linden St.,.....Oakland, Cal.
Cable "Espra." Correspondence invited.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Expert in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

ABBOT A. HANKS,
CHEMIST AND ASSAYER.
Successor to Henry G. Hanks, est. 1866. The supervision of sampling of ores shipped to San Francisco a specialty.
—718—
Montgomery Street,
San Francisco.

F. H. STEVENS,
MINING ENGINEER,
U. S. DEPUTY SURVEYOR,
IDAHO SPRINGS,.....COLORADO.

HORACE F. BROWN, M. E.
Mechanical Roasting, Cooling and Conveying of Ores. Automatic Milling Plants for Standard Process of Extraction.
Present address, Victor, Colo.

WM. VAN SLOOTEN,
Consulting Mining Engineer and Metallurgist.
Cable address: "Yadoplata."
25 WALL STREET .....NEW YORK, N. Y.

E. E. BURLINGAME'S ASSAY OFFICE AND Chemical Laboratory. Established in Colorado, 1866. Samples by mail or express will receive prompt and careful attention. Gold and silver bullion refined, melted and assayed or purchased. Address 1736 and 1738 Lawrence Street, Denver, Colo.

E. A. STEVENS.
Mining and Consulting Engineer,
VICTOR, COLO.
Reference: J. F. Burns, president and late general manager Portland Gold Mining Co.
Seven years' experience in Cripple Creek district.

EXPERT EXAMINATIONS OF ORES
Etc., as to their adaptability to
CYANIDE TREATMENT.
Analyses, Assays, Advice about Methods, Plants, and all Expert Work relating to the subject.
Instruction Given.
THE KEITH
Electro-Cyanide Process
Avoids the Labor, Wastes and Expense incident to Zinc Precipitation and to other Electrolytic Methods. Only slight alterations to existing plants necessary to enable the use of this process.
Correspondence Solicited.

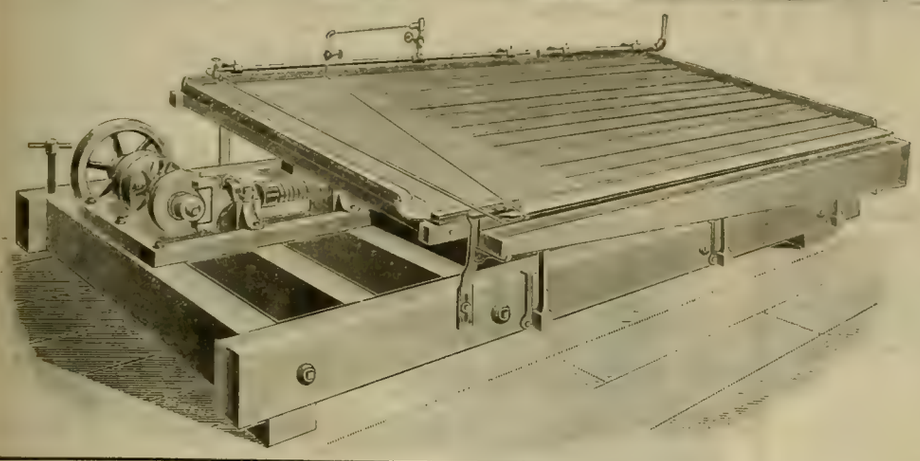
(Successors to WM. AINSWORTH.)
Denver, Colorado, U. S. A.

THE RISDON HAMMERED SHOES AND DIES

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

THE RISDON IRON WORKS, SAN FRANCISCO.



WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

GEORGE E. WOODBURY,

Send for Catalogue. No. 141 First St., San Francisco, Cal.

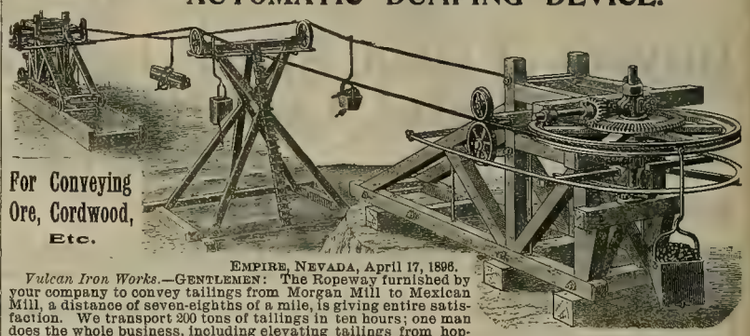
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the dumper requires no attention whatever. The Vulcan loader I consider Ropeway, making it possible for one man to load 200 tons in ten hours. Ropeway generally. The self-the best feature in the whole

Yours very truly, J. P. WOODBURY, Supt.

RIGID. SIMPLE. DURABLE. EFFICIENT. ECONOMICAL.

Effect a Saving in Friction Losses. No Trouble to Install. No Alterations of Mill Necessary. No Keys or Wedges to Adjust.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.

Manufacturers of All Classes of Mining Machinery. Estimates Furnished.

OFFICE OF WILDMAN GOLD MINING COMPANY. SUTTER CREEK, CAL., June 28, 1898.

Globe Iron Works, corner Main and Commerce Streets, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far **do not show any wear either on the Guides or the Stems.** They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. **It is our intention to replace all of our Guides with those of your make,** and I cheerfully recommend them to any one desiring a good, serviceable and economical Guide. Very truly yours, JOHN ROSS, JR., Superintendent.

THE BEST (MINE PUMPS) IN THE WORLD.

OUR SPECIALTY.

We carry in our Denver store a stock of Improved Pattern Sinkers and Duplex Station Pumps, with duplicate parts for repairs.

These goods are pronounced of a very superior quality by the large number of consumers who are now using them.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark

Our German drawing instruments bear only the trade marks or

We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Paragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 9, 1899.

SILVER. — London, 27¼d; New York, 59½; San Francisco, 59½; Mexican Dollars, 47½@48. New York exchange, sight, 17½; telegraphic, 20 cents premium.

Gold continues to arrive from Australia. On the 11th ult. the Mariposa brought $2,434,300; last Wednesday the Moana arrived with $2,190,870.

LEAD.—New York reports "dull" $4.57½ bid, $4.62½ asked. The firm naming the settling price for leading miners and smelters at the West quotes Lead at $4.30.

Local, pipe, 6@6¼c; sheet, 6½@7c; pig, 5¾c; bar, 6c.

COPPER.—Still booms: New York reports Lake "strong," $17.75 bid, $18 asked. Local bar 21c per lb.

New York reports: "After some small sales at 18c, it is very uncertain that any more copper of the lake brands could be picked up at this figure. Manufacturers have advanced the price of sheet copper to the case price of 21½c—an increase of 2½c per pound."

At Chicago last week Lake copper was quoted in carload lots 18c, small lots 18¼@18⅜c. Casting was 17¼c carloads and 17½@17⅝c for small quantities. Tin was higher at 26@26½c. Lead 4.45c in car lots, small quantities 4⅜@4¾c. Spelter 5.65c, carloads, 6c in small lots. Antimony is 10¾@10⅞c in small quantities. The selling prices of dealers were as follows: Copper, heavy, $16.50; copper, bottoms, $14.50; heavy red brass, $15.50; heavy yellow brass, $11; light brass, $8.50; lead, $4; tea lead, $4.40; zinc, $4.10; pewter, $15.50.

IRON.—American, soft, $22@24 per ton; Scotch, $25. Local bar, 2¼c per lb.

SPELTER.—10½.

TIN.—Pig, 23c per lb.; Bar, 26c. New York reports "easier," $23 bid, $24 asked.

ANTIMONY.—16.

BABBITT METAL.—No. 3, 8c.

QUICKSILVER.—An advance in export is reported. Local, $42; export, $39.00@39.50; carload lots, special rates.

The price of quicksilver has advanced in London to £8 15s 6d per flask (76½ pounds), equivalent to about $44 in our market. This is an advance of £1 during the past month. The visible supply of quicksilver in the United States is placed at 6500 flasks. Advancing prices continue to be predicted, based on the improvement in the industrial demand. There is no manipulation connected with the advance.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13⅜c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd..	14 50	Welsh Anthracite.	12 50
Scotch	8 00	Rock Springs	7 60

COKE. — Foreign, $13; domestic, $12 per ton.

CHEMICALS. — Cyanide of potassium, jobbing, 30 @ 31c per lb.; carloads, 29c; in 10-lb. tins 37c; sulphuric acid, 2¼c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2¾c per lb.; blue vitriol, 4¼c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9¼@10c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French. 2¼@2½c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 15c; chlorate of potash, 25c; caustic potash, 12c.

CANDLES.—Electric Light Candles—6s, 16 oz., 7½c; 6s, 14 oz., 6¾c; 6s, 12 oz., 5¼c; 6s, 10 oz., 4½c; Granite (Mining) Candles—6s, 16 oz., 8¾c, 6s, 14 oz., 7¾c; 6s, 12 oz., 7¼c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6, 12s, white, 8c; colored, 9c.

NAILS.—List per keg: No. 20 to 60d, wire, $2.40; cut, $2.25; 10 to 20d, wire, $2.45; cut, $2.30; 8d, wire, $2.50; cut, $2.35; 6 and 7d, wire, $2.60; cut, $2.45; 4 and 5d, wire, $2.70; cut, $2.55; 3d, wire, $2.85; cut, $2.70; 2d, wire, $3.10; cut, $2.95. In carload lots, 10c per keg less.

The American Steel Wire Co. has advanced the price of wire and wire nails $2 a ton, making the price $1.45 a hundred base at mills to jobbers, and wire nails $1.60 a hundred.

San Francisco Stock Board Sales.

SAN FRANCISCO, Feb. 9, 1899.

The week's business was of larger volume at an average of unchanged prices. It is in the East the big business is now being done in mining stocks. Boston and New York are doing tremendous business. A New York man says:

"Take the total transactions of a week ago to-day, for instance, which were published as being anywhere from 1,600,000 to 1,800,000 shares. As a matter of fact, the aggregate for that day was 250,000 to 500,000 shares in excess of the 2,000,000 mark. The market was so congested on that day, and also on other days of last week, that the clerks and reporters were unable to get a record of anything like an accurate total. Brokers were too busy to stop to tell of transactions, and the result was that the published totals, as large as they were, were away off from the mark. There is a dearth of good brokers' clerks in Wall street at the present time, and some of the houses are advertising for help in bold-face type. So great is the demand for well-equipped brokerage help that the men can practically name their own salary. I know of one house that pays a head clerk $400 per week. His duty is to keep the other clerks in line so that they can keep up with the business of the concern. Many of the active houses have day and night shifts, and practically all of them have to pay fines daily for not getting their stock sheets into the Exchange on time. One commission house recently played a mean trick upon one of its associates by buying up its entire clerical force. The firm made an offer of double pay, and practically the entire force went over to the enemy. Commission brokers and floor specialists are holding their heads high nowadays, and their customers in many cases are congratulating themselves if their orders are executed."

Assessment Notices.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of January, 1899, an assessment (No. 20) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 21st day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Rooms 15 and 17, San Francisco California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of January, 1899, an assessment (No. 17) of 1 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office -217 Sacramento street, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1899, an assessment (No. 115) of Twenty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on TUESDAY, the 21st day of February, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 13th day of March, 1899, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14 Nevada Block, No. 309 Montgomery street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1899, an assessment (No. 15) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of February, 1899, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 11th day of March, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of February, 1899, an assessment (No. 23) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of March, 1899, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 3rd day of April, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

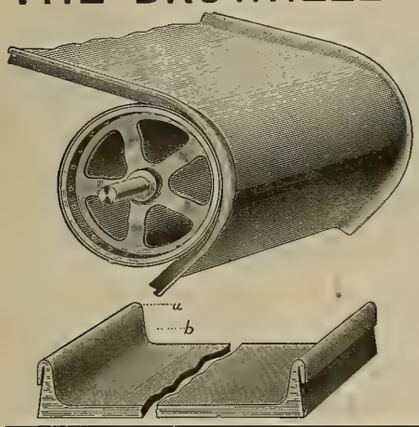
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 2015.—VOLUME LXXVIII. Number 7. SAN FRANCISCO, SATURDAY, FEBRUARY 18, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A California "Horseless Carriage."

In the issue of December 24th, '98, an illustrated page was devoted to the present status of motor road locomotion, with mention of the recent Paris exhibition where were exhibited twenty-six "horseless carriages," of which sixteen were electric and ten gasoline. The subject is one that is attracting world-wide attention, and in few departments of industrial progress is there greater advancement than in that of furnishing suitable vehicles that dispense with the horse on ordinary streets and roads. Several California mechanicians have given the subject intelligent application and in two or three instances have produced vehicles that have answered all practical requirements; in all cases gasoline supplying the motive power. The success that has attended the manufacture of the road engines built by the Best Manufacturing Co. of San Leandro, Cal., for freighting purposes, naturally makes prominent any production of that firm along the line of supplying the traveling public with a device suitable for passenger traffic, and recent trials of a gasoline motor carriage built by that enterprising concern have demonstrated ability to make as great a success of such a motor as has been made in the manufacture of the Daniel Best 50 H. P. traction engine which is now successfully used in freighting, hauling 35-ton loads over roads with a grade of 25 inches to the rod.

Herewith is illustrated the latest creation of the San Leandro establishment, one engraving representing the motor carriage at rest: the other a snap shot of the vehicle carrying seven people on a pleasant January afternoon.

DANIEL BEST'S LATEST PRODUCTION.

This gasoline motor carriage is the first effort of the Best Manufacturing Co. of San Leandro, Cal., and they are so well pleased with its performance that they contemplate manufacturing them for the market. The weight of the vehicle with water and gasoline aboard for a trip of 150 miles is 2570 lbs. It is propelled by a 7 H. P. horizontal motor having two cylinders with the crank set at 180 degrees, thus avoiding disagreeable vibrations. Ignition is by an electric spark, and the motor is started by a crank the usual way, the starting being assisted by an arrangement for low compression. All speeds from four to twenty miles an hour may be obtained by means of a lever on the left hand side of front seat, controlling a system of friction clutches with belt and chain transmission; also has a speed for climbing hills, enabling it to ascend as much as a 10% to 15% grade with load of passengers. A varied speed can be obtained by changing the speed of engines; this carriage has attained a speed of eighteen miles an hour, carrying a weight of 1800 lbs. The pivoted hub is employed for steering, the lever being placed in the center of the front seat convenient to the operator. The wheels are fitted with solid rubber tires, wooden hubs, spokes, and steel rims, and are provided with roller bearings; differential gear on countershaft to facilitate turning, the lubrication being entirely automatic. It is also provided with a grip brake on the wrought rim sprockets which are bolted to the rear wheels, which is powerful enough to bring the carriage to a sudden stop. The main frame of the carriage body is made of channel steel and the frame for the running gear, of pipe. The entire carriage is made of the best material and in the best manner that mechanical skill can suggest to give it strength and durability for hard work. This vehicle is especially designed for family carriages, stage coaches for carrying mail and passengers.

BEST'S GASOLINE MOTOR CARRIAGE IN MOTION, CARRYING SEVEN PASSENGERS.

The New York City exhibit of automobiles closed on the 28th ult. Like its Paris predecessor, electricity and gasoline were the motive powers; of the former kind one was exhibited by a Connecticut firm that could make a distance of thirty-five miles on a hard, level road with one charging of the accompanying chloride storage battery: the gasoline motors were mostly small affairs, one being capable of carrying two persons at a speed of fifteen miles per hour. The California automobile herewith portrayed can carry eight, with a speed of eighteen miles per hour on the level.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent

Office, No. 330 Market Street, San Francisco, Cal.

Telephone Number, Davis 771.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

J. F. HALLORAN.....Publisher

San Francisco, February 18, 1899.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Daniel Best's Latest Production; Best's Gasoline Motor Carriage in Motion, Carrying Seven Passengers, 173. The Plate Battery Screens, 176. C. E. Motor; C. E. Motor, Wall Suspension; C. E. Armature; C. E. Motor Armature Without Coils, 177. A Chart for Sunrise and Sunset, 178. Latest Mining and Metallurgical Patents, 179. The Bryan Quartz Mill, 182.

EDITORIAL.—A California "Horseless Carriage," 173. The Mineral Land Bill; The Unusually Cold Weather at New York; Prices of Copper; Advertisement for the Union Iron Works; Convention of the Late Miners' Association; A Colorado Decision; Electric Power Transmission; Railroads and Interest Rates; An Act Before the California Legislature; Increased Taxation on Mines, 174.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 183-84-85.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 198.

MISCELLANEOUS.—Concentrates, 179. U. S. Gold and Silver Coinage, Worth, Ratio of Gold and Silver, Etc.; The Plate Battery Screens; Machine Work; The Lead Interest; Ice Storms; Location of the Soul; Tusk of a Mastodon, 176. Some Experiences of a Working Miner; Details of the New C. E. Motor; The Advance in Copper, 177. The "Electro-Zinc" Process and Experimental Researches Which Lead to Its Development; A Chart for Sunset and Sunrise; Struck Against a Live Copper Wire; The Largest Steamship in the World, 178. Latest Mining and Metallurgical Patents, 179. Latest Progress in the Application of Storage Batteries; An Improved Safety Explosive; The Automobile, 180. Notes on Experimental Metallurgy; Secret of Casting Copper Again Discovered; Patent Office Statistics, 181. A Notable Victory for the Bryan Quartz Mill; The Genesis of Petroleum and Asphaltum in California, 182. Personal; Obituary, 185. Industrial Notes; Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 186.

IN the California State Senate, Senator Davis of Amador Co. urges a joint resolution earnestly commending to Congress favorable consideration of the mineral land bill—a commendable effort and one that deserves immediate approval by reason of the magnitude of the interests involved.

AT Brooklyn, N. Y., last Saturday, the unusually cold weather incited constructing engineers, when the thermometer was —3° F., to take measurements of the Brooklyn bridge, trusses and other parts, to find out how much the contraction had been. In comparing these figures with those taken last July, when the thermometer was 90° F., it was found that the difference was 14½ feet.

SELLING prices of the Con. Cal. & Va., in old Comstock boom days, are recalled in the news from Boston that Calumet & Hecla stock sells at $800 per share. Of course, such a price, as 18 cents for copper, must occasion tremendous activity in production. One broker puts a column into three lines in saying: "People appear to forget that copper will sell harder at 18 cents than 10 cents, but will be produced a great deal more easily at 18 cents than at 10 cents."

SOUTHERN CALIFORNIA papers oppose the Act now before the California Legislature, entitled: "An Act authorizing the location and sale of mining claims upon public lands of the State," and declaring that "all the lands owned by the State of California, by virtue of its sovereignty, or acquired by grant of the United States, other than the 16 and 36 sections, and land for public use, containing placer, or other deposits of the character subject to location and sale under the laws of the United States relating to mining lands, were the same situated upon public domain of the United States, are hereby declared to be free and open to exploration and location by citizens of the State of California, to the same extent, and in the same manner, and upon the same terms and conditions, as are by the laws of the United States, and not of the State of California, provided for the location and working of mining claims upon public lands of the United States." The bill provides that a patent can be obtained for any such lands by any person, association or corporation, "claiming land by location or purchase from locators thereof," by filing in the office of the State Surveyor General application for a patent, and this can be on unsurveyed lands, if the applicant ask that it be surveyed and pay the expenses, the purchase price of the land from the State to be $2.50 per acre.

A Colorado Decision.

In the appeal case of the Mount Rosa M., M. & L. Co. vs. J. S. Palmer, the Colorado Supreme Court last week rendered a decision.

The Mount Rosa Co. located a placer claim in the townsite of Victor. While the company was still in possession, but before it had applied for a patent, two lode mining claims, 300 by 1500 feet each, were located by other parties who afterward sold them to Palmer, the defendant. Afterward the Government granted the patent for a placer claim to the Mount Rosa Co. Suit was brought by Palmer against the company to quiet his title to the two lode claims. The El Paso Co. court decided for Palmer and gave judgment to him for 20.3 acres, the full extent of his two claims as lode claims. The decision of the Supreme Court is that Palmer is entitled to 100 by 1500 feet, instead of 600 by 1500 feet, as the lower court awarded, holding that the law regulating the taking up of placer claims provides that if a lode or vein is known to exist on the land prior to the time patent is applied for, the locator of the placer claim may also locate the lode, and that this lode claim shall be 50 feet wide, 25 feet on either side of the vein. If the locator of such placer does not locate a lode known to exist on the placer claim before he applied for patent, the United States law is that he abandons such lode and it may be taken up by anyone else. The contention of the Mount Rosa Co. was that as the two lode claims had been located by the grantors of Palmer prior to the time the company applied for patent, the company had not abandoned the lode claims. The Supreme Court holds that Palmer had the same right to locate a lode claim on the placer claim that the United States law provided the Mount Rosa Co. had; namely, two claims 50x1500 feet each, or 100x1500 in all. Neither of these two points—whether a person may locate a lode claim on placer ground before patent for the placer is applied for, nor the extent of such lodes, has ever been decided before in Colorado.

The Colorado Supreme Court has evidently based its decision not on the U. S. statutes but upon the ruling of the Secretary of the Interior, in the case of the Shoubar Lode, 1 L. D. 551, 3 L. D. 388, where he ruled that where a lode claimant has failed to adverse a placer application he will not be permitted to acquire more than 25 feet of surface on each side of the lode. In the case of Aurora Lode v. Bulger Hill and Nugget Placer, 23 L. D. 95,348, it was further held by the Secretary of the Interior that where a lode claimant adverses and is defeated in the suit upon such adverse claim he shall be limited to "so much surface as is reasonably necessary for his use in connection with the located lode." The subject is one of interest and has been elaborately argued and repeatedly decided in California and Montana courts.

Electric Power Transmission.

The progress of practical electrical development is illustrated by comparison of the statement a few years ago, from then authoritative sources, that a 25-mile transmission was "an interesting possibility," with the fact that this month a southern California power company has completed a high-voltage long-distance transmission line from its power house in the San Bernardino mountains to Los Angeles eighty miles away, capable of carrying 33,000 volts for transmission.

This is not the limit of possibility in that direction, but to date marks the maximum reached. In these matters California occupies prominent place. During the present week a contract was let at Visalia, Cal., for a long-distance transmission electric light and power line sixty-two miles, the source of power being the Kaweah river thirty miles distant. Minor enterprises are of numerous occurrence and are of prime importance in connection with the industrial development of the State. There are several very large long-distance electric transmission plants now in successful operation in various parts of California, the San Antonio plant of Pomona being the world's pioneer in high potential.

Washington State presents another example of progress therein. The Snoqualmie Falls Power Co. announce the virtual completion of a remarkable hydro-electric project, of which considerable has already appeared in these columns. This company takes the water of Snoqualmie Falls—a height of 268 feet—generates a high-potential electric current and carries it thirty miles on aluminum wire to supply light and power. This service is over two separate pole lines, carrying four independent 25,000-volt circuits; 6000 H. P. is the initial capacity of the plant.

Railroads and Interest Rates.

Illustrative of the decline in current rates of interest and the changes in value of railroad stock as an investment is cited the case of stock of the New York Central Railroad, of which several years ago Wm. K. Vanderbilt sold 300,000 shares for $130 a share with the promise that it should pay 8% dividend. The dividends have fallen steadily until they are now but 4%, yet the stock is selling to-day at $140, or more than when the rate of interest was double what it is to-day. It is figured that about $300,000,000 worth of railroad bonds are now outstanding in this country, paying 7% interest and representing sixty-five different issues. Nearly all of these bonds will mature within the next ten years and those roads will thereafter refund them with issues paying a much lower rate of interest. There are twelve issues bearing 3½% interest, eleven paying 3% and one 2½%.

In connection therewith, it is of further interest to note the railroad feature as affecting loans and rates of interest. The downward tendency of interest rates is universally noticeable. One of the reasons for such lowering is thought to be the manifest fact that the railroads of the country are reversing their former methods and are lending money instead of borrowing it. Time was when big railroad corporations borrowed extensively for improvements and extensions; now they devote their surplus earnings and profits to supplying the immediate monetary requirements of the men who formerly looked to banks for such accommodation. In this they are in line with leading industrial corporations throughout the country. Then, too, the West is not in need of borrowing from the East, but has money of its own to lend. These, with gold imports and generally higher prices, are among the causes for the present scramble for securities or insecurities that, though paying but 4%, command a higher price than when they paid 8%.

AT the last annual convention of the California State Miners' Association Gov. Budd jocosely suggested in his address to the delegates that at the next legislative session the California miners take measures to sequestrate the $250,000 appropriated by the State five years ago in conjunction with a national appropriation similar in amount, and which is unexpended in the general fund. He pointed out that the usual legislative raid on the State general fund might make a minus quantity of that amount. Acting on the pointer, Senator Davis of Amador this week introduced bill No. 302, creating a State debris fund of $250,000, and having transferred thereto the sum of $250,000. It was at once favorably reported by the committee to which it was referred, and will doubtless become a law.

PROBABLY the greatest advertisement ever given to any American manufacturing concern is that received by the Union Iron Works of San Francisco, builders of the battleship Oregon. Her great run around Cape Horn, her immediate readiness thereafter for active duty and her glorious Santiago record have been the theme of countless columns in every publication in every language on earth. The same firm will now receive plaudits of additional fame in the successful completion for the Japanese Government of the Chitose, the fastest war cruiser afloat. Last Saturday's official trial on San Francisco bay gave that vessel an official speed of 23.76 knots, exceeding the Minneapolis by .69 of a knot.

INCREASED output always occasions renewal of suggested legislation levying increased taxation on mines and their products. Arizona's Legislature is now discussing a bill providing for the levy and collection of a tax of $2 on each $100 of the net proceeds of mines in that Territory. The Michigan Legislature has before it a bill placing a tax of one cent per pound "on copper ore that goes into the market at 14 cents per pound." Up to '91 Michigan mine output was thus taxed.

Concentrates.

TO RAISE 2200 cubic feet water per hour from a mine 378 feet deep would require 26.25 H. P.

THE Idaho Legislature last week "indefinitely postponed" a bill making eight hours a legal day's work for a miner.

CYANIDE results from the Cigale, West Dip region of Utah, indicates that in that section at least it pays to roast the ore.

A DREDGE weighing 30,000 pounds, with a daily capacity of from 600 to 1200 cubic yards, would require a motor of 25 H. P.

INCREASING membership and a higher price therefor exemplifies the present prosperity of the Salt Lake, Utah, mining exchange.

"MUNDIC" is a Cornish term for iron pyrites, or arsenical pyrites. It occurs in auriferous quartz, having a bright, scintillating luster.

IN the British Columbia Parliament a bill has been introduced repealing the recent law excluding "aliens" from placer mining in that province.

ZINC was never higher than at present, which with the comparatively good figure for lead will tend to develop the zinc-lead properties of Colorado and Utah.

ON the New York Stock Exchange, Colorado has thirty-three of the eighty-eight mines which are dividend payers; Utah, twelve; California, eleven; Montana, ten.

A SUBSCRIPTION to the stock of a corporation can not be varied by parol testimony as to a contemporaneous understanding to accept payment in property instead of money.

AN agent who represents both buyer and seller, without their knowledge of such double representation, their interests being antagonistic, cannot recover commissions from either.

TO FIND the weight of water in a pipe, square the diameter in inches, divide product by 3; the result will be the weight of water in pounds for each foot of pipe. The same rule applies to circular, vertical tanks.

AN unpatented mining claim cannot be "jumped" if its original locator, before Jan. 1st of the year succeeding its location has begun the necessary "assessment" work, and by consecutive days labor completes it.

AT 18 cents per pound for Lake copper, it is only necessary for the companies to sell 8¼ pounds of the metal in order to net $1 clear profit, as it is understood that the cost of production does not exceed 6 cents per pound.

A CUBIC FOOT of cast brass will weigh 504 pounds; rolled, 524 pounds; of rolled copper, 548 pounds; of 24 carat gold, 1204; of platinum, 1342; of steel, 490; of silver, 655; of cast iron, 450; of mercury (32° F.) 849; of quartz, 165.

MINERS back from the Klondike say that there has been a most unusual period of mild weather at Dawson. To such an extent was this the case that many of the shafts upon which the men were at work have been filled with water.

A TANK containing 6000 pounds of water at a temperature of 60° F., to be heated to the boiling point will require 909.272 pounds steam at a pressure of 100 pounds per square inch, the steam discharging directly into the water.

IN the rush of water consequent on the recent bursting of the reservoir at the Big Dipper gravel mine, Iowa Hill, Placer Co., Cal., a 1600-pound shaft was carried three-fourths of a mile down the canyon. The mill will be rebuilt.

BRITISH COLUMBIA wants the Canadian Government to appropriate $50,000 for a mineral exhibition at Earl's Court, London, this year, and at the Paris Exposition in 1900. Such an exhibit would be a good investment for any mining region.

A CLASSIFICATION of electricity according to its statics or dynamics would be: 1, electricity at rest, or static electricity; 2, electricity in locomotion, or current electricity; 3, electricity in rotation, or magnetism; 4, electricity in vibration, or radiation.

LEAD pipe will weigh per foot, according to diameter; ¼ in. 1 lb; ⅜ in. 1 lb. 5 oz.; ½ in. 2 lbs. 3 oz.; ¾ in. 2 lbs. 11 oz.; 1 in. 3 lbs. 7 oz.; 1¼ in. 3 lbs. 11 oz.; 1½ in. 5 lbs. 3 oz.; 1¾ in. 5 lbs. 5 oz.; 2 in. 6 lbs. 11 oz.; 2½ in. 10 lbs.; 3 in. 11 lbs. 10 oz.; 3½ in. 15 lbs.

THE Western Chemical Co. of Denver, Colo., are credited with success in manufacturing what is practically chemically pure sulphur worth $22 per ton. The sulphur was produced from iron pyrites taken from the Vulcan mine of Gunnison county, unusually rich in sulphur.

"A MICHIGAN copper mining company, about to begin sinking two big shafts, proposes to make one power house and hoisting works simultaneously serve, using two drums." So says a Marquette, Mich., exchange. Details of such an arrangement would be interesting.

DENVER papers again assert that, with two exceptions, the Colorado smelters have joined in "an ironclad combine to so control the price of silver as to force it up," and, incidentally, to raise the smelting rates. The present smelter rate for lead is about 38 cents per 100 pounds less than the market quotations.

CONCERNING the recent rich find in the Crowned King mine in Bradshaw basin, thirty-five miles south of Prescott, Arizona, a feature of the strike is the abrupt change of the ore from basic iron pyrites to free gold. In that region, as elsewhere, many of the mines are free milling on the surface.

AT the Tamarack mine, Calumet, Mich., last week, E. Hawkins, a laborer, fell down the shaft, from the surface, a distance of over 5000 feet. A few fragments of the body were found. He was doubtless unconscious before he had fallen 500 feet, and dead before he was 1500 feet down. The fall occupied eighteen seconds. This from a column of local chronicle.

"DELTA METAL" is an alloy whose first manufacturer was one Dick. It is compounded of zinc, holding a little iron in solution, and melted copper. The statement is made that the iron is so intimately combined in delta metal that no magnetic effects are traceable to the alloy, which recommends it for mathematical and optical instrument making—though on doubtful grounds. There is certainly considerable resistance to corrosion on the part of the alloy in question; and its toughness and strength are qualities of special value.

IN looking over the books of the Virginia, Nev., Miners' Union from Jan. 1st, '89, to Dec. 31st, '98, the *Enterprise* estimates that 168 members in good standing died within the time specified; the cause of death in seven-tenths of the cases was miners' consumption. One hundred and sixty-eight deaths at $82 50 each, aggregates $13,860 paid in cash by the union in the decade.

FROM every part of the region east of the Sierras come accounts of unusually severe weather. Throughout Colorado—especially in Boulder, Clear Creek, Gilpin, Lake, Summit, San Miguel and Eagle counties—the drifting snow and cold weather have occasioned serious loss, and in parts of Utah, Nevada, Idaho and Montana the low temperature and great snowfall caused temporary cessation of considerable outside occupations.

THE output of gold from the Klondike and British Columbia has raised Canada to the fifth place in the list of gold-producing countries. While the United States shows a greatly increased output for '98, it is second to the Transvaal, South Africa. The five leading gold-producing countries for '98, according to figures recently published, are: Transvaal, South Africa, $73,476,600; United States, $64,300,000; Australia, $61,480,768; Russia, $25,186,994; Canada, $14,190,000.

AT the Golden Jubilee Miners' Exposition in San Francisco one year ago, several suggested an idea that, put into execution, would have been an interesting and valuable part of any mining exhibit. It would look well in any State mining display at the Paris Exposition, viz: a complete quartz gold producing and milling plant in miniature, from the extraction of the ore to the gold bar. Men who are familiar with the process sometimes forget that to many others a representation of how it is done would be of interest. Were such a device on a scale as small as could be practically operated to be exhibited anywhere where multitudes congregate, it would be a continual center of attraction.

OF course, it is "possible" that a ton of gold "ore" would "run" $500,000, as claimed in the Denver daily's excerpt regarding Isabella, though the "ore" would not be greatly in evidence. Our Colorado correspondent need waste little time on figuring on the value of a "ton" of gold, though correct in asserting that a "ton of pure gold at $20.67 per ounce would only be $496,080," if two things be allowed—one that there is such a thing as a "ton" in troy weight. There does not appear to be, and if a "ton" is talked of it is necessarily in sole connection with avoirdupois weight; this would necessitate the use of that system of weight in which the denomination "ton" appears, and, according to such use, a "ton of pure gold" would be worth $602,875.

ALUMINUM BRONZE is likely to come into general use. It is an alloy of 90% to 95% of aluminum and 5% to 10% of copper, of golden color, and keeps well in the air, without soon becoming dull and changing the color. It can be cast excellently, can be filed and turned, possesses unusual hardness and firmness, attains a high degree of polish, and is malleable and forgeable. The technical working of the material is not essentially different from that of iron; the metal is, especially in a warm condition, worked like iron on an anvil, with hammer and chisel, except that the temperature to be maintained in forging lies between dark and light cherry red. In case the articles are not forged in one piece, and the putting together of separate parts is a necessity, riveting and, in particular, soldering have to be resorted to, with soft or hard solder. Besides forging, the bronze is well suited for embossing. After finishing the pieces the metal can be toned in different ways, as may be desired, by treatment with acid.

C. T. G., RED ROCK, ARIZONA, wants "a cheap binding material for manufacturing briquettes from fine ores to be used in smelting," and to know how a reasonably hard briquette is made. Answering the first part of the question, generally, burned lime is used as a binding material, but in some places—for instance, at the El Paso, Texas, smelter—rich clay is used. A high authority on this subject writes to the MINING AND SCIENTIFIC PRESS: "I personally prefer lime." A leading smelting works uses about ¾% lime in the Chilian mill, where the ore and lime are moistened and mixed. From the Chilian mill the mixture is discharged into a conveyor and disintegrator of very simple design. This conveyor drops the mixture into a hopper and from here it drops by gravity into the feeder of the moulding press. From this mixture is made bricks of fine ores, lime and water, 8x4x2¾ inches. The bricks are put on edge on shelves and allowed to dry and set, which requires in warm, dry weather about four days, in damp weather as much as eight days, after which the bricks are ready to be fed into the blast furnaces.

TO DETERMINE whether fine gold in fine tailings is amalgamable by a more effective system than copper plate process is only worth while in cases where exhaustive tests show that there is a profitable commercial advantage in adopting a more complicated process; for in all things the laboratory question of perfectness always gives way to the practical question of profit. Where the loss is very high in the fine tailings or slimes it will doubtless be found also high in the coarser sizes of tailings, and, as a consequence, it becomes really a question of another system of treatment for the original ore, not solely of the slimes, and is therefore to be treated under the head of "gold in a condition not susceptible of amalgamation on copper." Probably the best test of the highest amalgamation obtainable is by use of an amalgamation pan, either large or small. Small laboratory pans are made which can be run either by hand or from any small running shaft, and will take a charge of three to five pounds of ore. These small pans, if properly constructed and run, will give results closely approximating mill work by pan amalgamation.

A PATENT for any land claimed and located for valuable deposits may be obtained as follows: Any person, association or corporation authorized to locate a claim, having so claimed and located a piece of land for such purposes, and complied with all legal requirements, may file in the proper land office an application for a patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the United States Surveyor-General, showing accurately the boundaries of the claim or claims, distinctly marked by monuments on the ground, and post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat, previous to the filing of the application for a patent, and file an affidavit of at least two persons that such notice has been duly posted, and file a copy of the notice in such land office, and thereupon be entitled to a patent for the land in the manner following: The register of the land office, upon the filing of such application, plat, field notes, notices and affidavits, publishes a notice that such application has been made, for a period of sixty days, in a newspaper to be by him designated published nearest to such claim; and he also posts such notice in his office for the same period. The claimant at the time of filing the application, or at any time thereafter, within the sixty days of publication, files with the register a certificate of the United States Surveyor-General that $500 worth of labor has been expended or improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnishes an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant files his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during such period of publication. If no adverse claim shall have been filed with the register and the receiver of the proper land office at the expiration of the sixty days of publication, it is assumed that the applicant is entitled to a patent, upon the payment to the proper officer of $5 per acre, and that no adverse claim exists; and thereafter no objection from third parties to the issuance of a patent can be heard, except it be shown that the applicant has failed to comply with the above terms.

PROF. HOFMAN'S description of the daily collecting of amalgam and dressing of plates at the 120-stamp mill of the Golden Star, S. D., is as follows: "When the plates are to be cleaned, the water supply of the one battery is shut off, the stamps are hung up and the splashboard removed and washed at the head of the apron plate with water through a hose. It is then placed at the lower end of the plate and the hose is turned on to the screen and apron to remove all the sands that have collected there. The plate, if normal, is now clear and bright, except for occasional spots, so-called blisters, resulting from iron and copper salts. These are removed with a scrapper (a blunt, double-edged chisel). Then the two men loosen the amalgam with heavy whisk brushes, beginning at the top and working downward. When this is done the amalgam is swept in the opposite direction and collected at the head of the apron. There it is brushed into the amalgam scoop with a rubber scraper (a small, sharp-edged piece of belting) and emptied into a small iron receiver. After this the plates are brightened by brushing them with a whisk broom, using tailings moistened with a dilute solution of potassium cyanide, the men working from the head of the plate downward. If necessary, a little quicksilver is sprinkled on the plate from a bottle, over the neck of which a piece of canvas is securely tied. After being brightened, the plates are smoothed with soft paint brushes passed transversely over them, beginning at the bottom. This finishes the operation, which requires four hours for the twenty-four plates. The amalgam contained is contaminated with impurities. To remove these it is placed in a Wedgewood mortar and diluted with quicksilver. The amalgamator then adds water and works the amalgam to bring all impurities to the surface. These are in part washed off (the sands) with a hose, in part removed with a sponge or wet cloth (the base-metal amalgam) until the amalgam is perfectly bright. It is then passed through a small strainer and the residual pasty amalgam is transferred to a piece of linen, where the excess of quicksilver is pressed out by wringing. The ball of hard amalgam obtained is locked up in a safe and kept until the next clean-up. All the sands are returned to the battery; the waters go to waste, and the quicksilver goes back to the main stock."

IN the Munktell chlorination process a chloridizing roasting is preferred. If the material after roasting and washing is found to contain gold in somewhat large grains, these may be conveniently separated by washing; or by some other mechanical means the heavy metals are removed. The material, after being reduced to a sufficiently fine powder and freed from protoxides—whether roasted and separated from the coarse grains of gold or not, as circumstances may require, is subjected to the following process: (The ore when pulverized should not be too fine, so as to allow liquids to percolate through it.) A small quantity of hypochlorite of lime, or some other salt in which the acid consists of chlorine combined with oxygen, is dissolved in water or in some suitable liquid, such, for instance, as a solution of chloride of sodium, when the raw material contains silver. Instead of chloride of sodium, chloride of calcium or some other substance capable of dissolving chloride of silver may be employed. The solution contains about 1% or less of hypochlorite of lime. This solution, before it enters the running tanks containing the auriferous material meets with a highly diluted solution of some acid, such as muriatic acid, sulphuric acid, carbonic acid or some other acid, the solution being of such strength that equal volumes of acid and the hypochlorite of lime will just suffice for the decomposition of the hypochlorite of lime. The mixed liquids now percolate through the material, whereby the chlorine produced by the mixture, partly in a nascent state unites itself with the gold, which is thereby dissolved, and is continually allowed to run off at such a rate that only a small excess of chlorine remains in the solution. This solution is led into the precipitation tanks, where the gold, and any silver present, is precipitated by one of the usual methods. This method of extracting gold can be carried out without the escape of any considerable quantity of chlorine. The solution may also be stronger and be mixed beforehand, and then, after a longer or shorter time, be poured over the crushed raw material prepared in the manner described. In this case, however, not only does much chlorine escape, which has a very detrimental effect on the carrying out of the process, but also, larger quantities of the solution are required. By allowing the chlorine in a very diluted solution to act on the auriferous substances, and by producing this chlorine at the same moment the solution is used, the process becomes convenient and comparatively inexpensive. The process can be carried out with simple apparatus. A convenient arragement consists of tanks having a layer of filtering medium above a false bottom. Over each tank are two vessels by which the quantities of the solutions are measured. They are filled by means of pipes or conduits and discharged into other conduits leading to the tanks. Other pipes or conduits carry water or other liquids to the tanks for dissolving and carrying away the protoxides, if any.

U. S. Gold and Silver Coinage; Worth; Ratio of Gold and Silver, Etc.

CROWN KING, ARIZONA, Feb. 3, '99.
TO THE EDITOR:—Is there absolutely $20 worth of gold in a $20 gold piece, or a fraction less?

BUTTE, MONTANA, Feb. 1, '99.
TO THE EDITOR:—How is the 16 to 1 gold and silver ratio figured out, and at present prices what is the ratio?

TELLURIDE, COLO., Jan. 25, '99.
TO THE EDITOR:—What are the gold and silver coins of the U. S., their weight and amount of alloy? What does each contain in pure metal?

GRANT'S PASS, OR., Jan. 20, '99.
TO THE EDITOR:—How much fine gold is there in a $10 gold piece?

SEATTLE, WASH., Feb. 2, '99.
TO THE EDITOR:—What are the San Francisco mint charges for coining gold, and what does the mint pay for gold?

It often happens that when several questions almost identical in point of inquiry are received, a few lines in "Concentrates" suffice for the lot; but in the case of the above five inquiries the subject is deemed of sufficient general interest to make complete and detailed answer in the manner following:

THE MINT OF THE UNITED STATES AT SAN FRANCISCO, SUPERINTENDENT'S OFFICE.

TO THE EDITOR:—In answer to the inquiries submitted as to the number of grains of fine gold in a gold dollar, and whether or not there is really twenty dollars worth of gold in a $20 piece of U. S. coinage, etc., the following may be said:

A $20 piece is worth exactly $20 in gold, and if melted and nothing lost in melting this will be shown to be the fact. The alloy therein neither adds nor detracts from the actual value of the coin.

In $1 U. S. gold coin there are 23.22 grains of fine gold and there are 464.40 grains of this pure gold in a $20 piece. One grain of gold 1000 fine is worth .0430663. The gold unit of value is the dollar which contains 25.8 grains of *standard* gold 900 fine; but the amount of *fine* gold in the dollar is 23.22 grains, the remainder of the weight being an alloy of copper. While the gold dollar is the unit and standard of value, the actual coinage of the $1 gold piece was discontinued in 1890.

An ounce of pure gold—that is, 1000 fine—is worth exactly $20.671834625, and a grain of gold 1000 fine is worth .0430663. Fine gold is 1000 fine and standard (or coin) gold is 900 fine. The Government pays for gold at the rate of $20.67 per ounce fine, or $18.60 per *standard* ounce 900 fine.

The Government makes no charge for coining gold if it is presented at the mint of standard fineness—that is, containing .9 gold and .1 copper. A charge is, however, made for preparing it for mint purposes—that is, when the bullion deposited is not suitable for coinage, as is usually the case, and therefore requires parting and refining. Charges are made for these operations equal to the expense incurred in taking out the base metals and parting the silver from the gold. A small charge is also made for the copper used in the alloy.

The accompanying table will show the actual fine gold and silver in U. S. coins, the weight of alloy and total weight:

GOLD.

Denominations.	*Fine Gold Contained, Grains.*	*Alloy Contained, Grains.*	*Weight, Grains.*
One dollar ($1)	23.22	2.58	25 80
Quarter eagle ($2.50)	58.05	6.45	64.50
Three dollars ($3)	69.66	7.74	77 40
Half eagle ($5)	116 10	12.90	129.00
Eagle ($10)	232 20	25.80	258.00
Double eagle ($20)	464.40	51.60	516.00

SILVER.

Denominations.	*Fine Silver Contained.*	*Alloy Contained.*	*Weight.*
Standard dollar	371.25	41.25	412.50
Half dollar	173.61	19.29	192.90
Quarter dollar	86.805	9.645	96.45
Dime	34.722	3 858	38 58

CHAS. G. YALE, Statistician U. S. Mint.
San Francisco, Feb. 8, '99.

The "16 to 1" gold and silver ratio is determined in two ways. Our Butte inquirer will note above that a gold dollar contains 25.8 grains *standard* gold (900 fine); a silver dollar contains 412.5 grains standard silver. The larger number divided by the smaller gives a quotient of 15.988372+ —practically 16. Again, an ounce of fine gold being worth $20.671834625, and an ounce of silver for coinage purposes being reckoned at $1.2929, the former number divided by the latter gives a quotient of 15.988+. Again, the alloy in both gold and silver coins bears the same relation to each other. Though the first and second ways cited illustrate on what the "16 to 1" ratio is based, yet it is further interesting in this connection to note that the same result can be worked out from similar comparison of the proportions of alloy used in coinage. It will be noted from the tables furnished by Mr. Yale that the alloy in the gold dollar is 2.58 grains and in the silver dollar amounts to 41.25 grains. Dividing the smaller number by the larger, as before, gives the same result as in the other two cases—viz., 15.988+.

Answering the inquiry of the Butte, Montana, reader, in a general and extended way, it may be said that, taking the number 20.67 as a "constant," and the current silver quotation as a divisor, the ratio may be easily figured for any year. For instance, forty years ago the London value of an ounce of fine silver at average quotation for that year—1859—was $1.36; the ratio that year was 15.29; in 1869 the same silver value was $1.32 per oz., making a ratio of 15.60; in 1879 silver's average was $1.123, being a ratio of 18.40; in 1889 it was $0.93512—ratio 22 10; so far in '99 silver is similarly quoted at 59½, which gives a present ratio of 34 744+.

Tin Plate Battery Screens.

TO THE EDITOR:—In your issue of January 14th, in his valuable contribution to the science of stamp milling, Mr. W. J. Loring of Angels, Cal., mentions two plate battery screens. Although a prominent mining engineer has referred to their adoption as being a retrograde step, the writer believes they are an improvement in principle upon those usually sold by the manufacturers. This I will attempt to show by the accompanying magnified sketch, in which *a*,

Fig. 1.

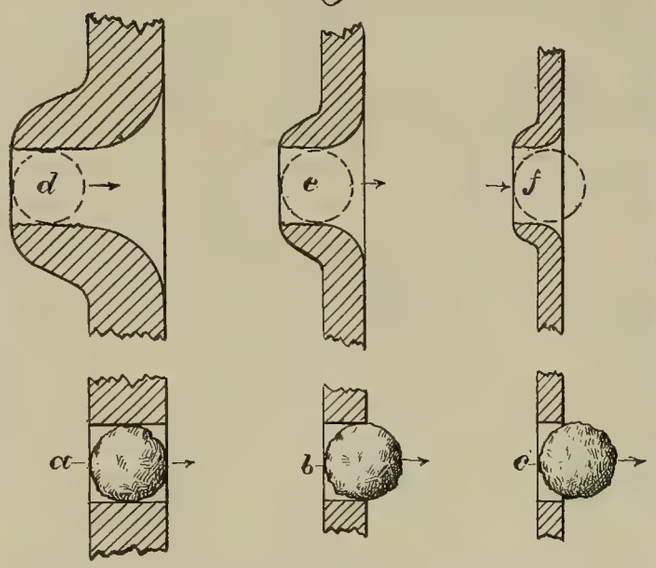

Fig. 1, represents a grain of sand lodged in the hole in the screen, whose thickness is equal to the diameter of the hole. At *b* the thickness is reduced one-half. At *c* it is but one-third that at *a*. Assuming that the splash of the pulp will force or hammer each grain of sand so lodged through the hole until its inner surface is flush with that of the screen, it will be observed that the thinner screens have much the advantage over that at *a*, where it is likely to remain lodged, while at *c* it is free to drop out. Herein I think lies the principle that permits the tin plate screen to hold its own where once used. Holes tapered from the outside are intended to obviate the difficulty, but they are expensive to make, and, if tapered enough to work well, the size is soon enlarged beyond the desired limit.

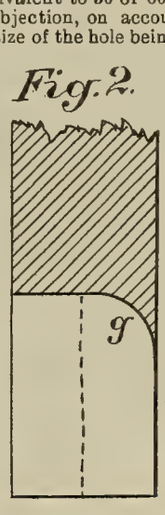
Although larger sizes of the burr punched screen, shown at *d e f*, run longer without clogging, those of No. 10 or 12 (equivalent to 50 or 60 wire mesh), are open to same objection, on account of the ratio of thickness to the size of the hole being usually greater

Fig. 2.



than with the Nos. 6 or 7, thus increasing their tendency to clog. I venture the conclusion that the punched screen of a thickness of about one-third the diameter of its holes has come to stay. Wire screens give too much trouble from clogging and breaking. Given a sufficiently strong and tough metal, round holes may be punched so close together as to be almost equal to the wire screen in issuing capacity, and without its tendency to clog, if made thin as above indicated. The same principle applies to trommel and other screens, a fact which I commend to the attention of screen manufacturers.

While on the subject of screens, it may be mentioned that some twenty years ago the writer adopted the plan of rounding the lip edge of the screen frame, as shown at *g*, Fig. 2, which causes the pulp to hug to it, following it down to the lip of the mortar. This removes the necessity of a splash-board or curtain, unless, perhaps, when using screens coarser than usual. MILLMAN.

Baker City, Oregon, Jan. 20th, '99.

Machine Work.

There are many people now living who can remember when joiner work, including even flooring and ceiling, was nearly all planed by hand—a laborious process that did not in most cases include thicknessing, and was consequently an inferior method, except perhaps as to finished surfaces; and even this exception is not to be in comparison with the fixed knife planing machine employed in Europe and, more notably, with smoothing machines invented in the United States.

Measured by manual energy, which may be taken as 2500 foot-pounds, or one-thirteenth of a horse power, for a strong man, it would take 130 men to equal the planing machine before named; but there is a difference in favor of the machine in the guidance and application of the cutting edges that justifies the ratios before named.

These comparisons convey an idea of the extraordinary economic results of machinery attained in the principal processes of wood conversion. They seem incredible, but there are no longer means of comparing, because values are now adjusted to the machine product alone, and handwork no longer exists.—John Richards, in the Engineering Magazine for February.

A WASHINGTON special says: "The lead interest will not suffer by reason of the negotiation of the treaty between Canada and the United States. Republican friends of the lead interest in this country have been especially active, and Senator Shoup of Idaho says that, after careful investigation, he believed there was no fear whatever of the incorporation in the treaty of any clause which would unfavorably affect the lead mining industry of this country. The knowledge of strenuous opposition in the Senate to any such proposition will, it is believed, be sufficient to prevent its incorporation in the treaty, which must subsequently be ratified by the Senate. Senator Shoup has been actively engaged during the past week in running down the rumors of action adverse to the lead-mining interests, and is satisfied that, if they ever had any basis, they have no standing before the joint commission."

ICE STORMS are commonly believed to be due to rain falling on surfaces cold enough to freeze it. The fact that the objects iced are often comparatively warm makes this simple theory insufficient, and observations during a remarkable ice storm last October, in Germany, have proven to Dr. W. Meinhardus that the phenomenon is one of the singular condition of liquids, known as "superfusion." In this state the liquid has a freezing temperature, but is kept from solidifying by some special circumstance. In the storm observed, reports from elevated stations showed that the moisture was condensed in an upper air stratum above freezing point in temperature, and that the rain fell through a colder stratum, becoming chilled to freezing temperature, but remaining liquid until the drop was deformed by striking a resisting body.

"THE SOUL," meaning the highest intellectual faculties, is located by the new phrenology in the posterior cerebral lobes. Dr. C. Clapham offers proof in the facts that the posterior lobes are most highly developed in man, and that the development is especially notable in men of great ability and in the highest races. The lobes are imperfect in idiots.

C. M. O'LEARY writes from Dawson that he discovered Dec. 8th on his claim on Hunker Creek the tusk of a mastodon. The tusk was imbedded in the snow and ice 30 feet deep. It was 9 feet long, 26 inches in circumference and weighed about 500 pounds. This would be an interesting specimen for the Mining Bureau Museum in San Francisco.

Some Experiences of a Working Miner.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS

As I came down the mountain road leading into T——, I had just reached the outskirts of the town when there occurred a terrific explosion, followed by a shower of rocks of all sizes, which fell all over the place. One large boulder crashed through the roof of the mill, narrowly missing the machinery. When I had waited long enough to feel reasonably sure that there would be no further demonstration of the kind, I continued on my way into town. On inquiry, I learned that the boss of a gang of men who were working in a large open cut had "sprung" three deep holes an hour previous and charged them with both nitro and black powder. They were "fired," and, although they had shaken up the ground considerably, had failed to do material execution. The boss, Mr. B——, then determined to break those holes, if it took all the powder in the magazine to do it, and he used plenty, with the result above stated, exemplifying in a most forcible manner the maxim: "Where there's a will there's a way." The common impression about town was that the magazine had exploded. Mr. B—— went to the office, explained the occasion of his experiment and drew his time, there being no objection.

Transportation of ores from mine to mill, or, rather, from stope to mill, is always an important matter and should receive careful consideration. At one of the largest mines in California, having a 60 stamp mill, the ore, after being broken down in the stope, is loaded from ore bins in the stopes into cars holding one ton each. These cars are trammed through a long tunnel and dumped into a large ore bin at the surface, from which it is reloaded into cars holding three tons each. These are made up into a train of six or eight cars and hauled to the mill on a "down grade." The ore is dumped into a large bin back of the mill, reloaded into small cars, trammed into the top of the mill and dumped onto the grizzlies, after which it passes through the mill automatically. The cars which haul the ore from the mine to the mill could as well be run into the mine, loaded there and then hauled to the mill and into it, and dumped with a single handling.

Another "trick," and *not* one worth knowing, is that of placing the ore breaker 18 to 24 inches, and even more, above the level of the ore floor. The only reason I could ever conceive for this foolish arrangement is that otherwise the men whose business it is to feed the breaker might have a chance to rest. I have in mind an instance where one man in ten hours put 200 tons of quartz through a single breaker every day in the week for months, and he had no grizzly, either. In this case the breaker was of a style and size suited to the work, and it is needless to say the breaker was not set above the floor level. I also have in mind another instance where, in a 10-stamp mill with grizzly, the rock-breaker man was kept constantly busy shoveling the entire shift to keep enough rock in the bins to feed the mill twenty-five tons daily. This breaker was too small for the work and it was set about 2 feet above the floor level, and every pound of ore that did not pass the grizzly had to be shoveled into the jaws of the breaker and the ore broken so coarse that a great deal of it had to be broken with a sledge before it would go into the crusher at all. It pays to think about all these things when building a mill.

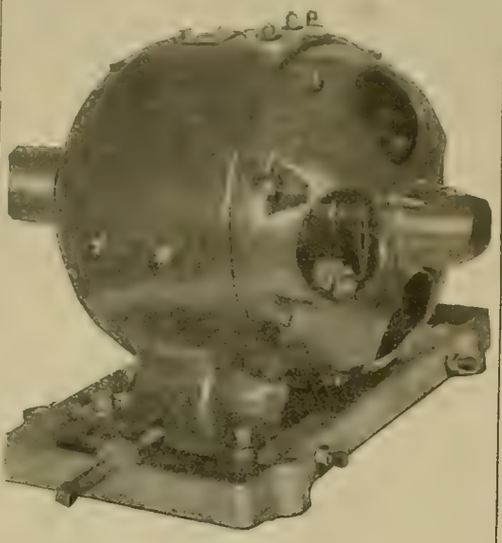
Speaking of mill construction recalls a large mill in a prosperous camp in this State, in which some improvement might have been made. The battery posts do not extend down alongside of the mortar blocks to the bottom of the pit, but are set on a saddle, or cross piece, which reaches transversely across the mortar block at the ends, resting on heavy timbers placed back and front of the mortars. Of course, this construction is calculated to furnish a firm foundation for the battery posts, but it does not, and the cam shafts jump and rattle at such a rate that the boxes require frequent rebabbiting.

Johnnie and Jimmie B—— owned a pretty good prospect that promised to become a mine some day, and a big one, too. They had opened it by a large, open cut, exposing the vein 30 feet wide. The cut was 20 to 30 feet wide at the face. They sold the mine for more money than they could count, and they took a contract from the purchasers, when they had completed the 60-stamp mill, to deliver 180 tons of ore daily at the head of the tramway leading to the mill. The price was 35 cents per ton. Johnnie and Jimmie hired three or four other men and they began operations by drilling about twenty holes, each 3 or 4 feet deep, and firing them. It sounded like Fourth of July, and tons of gold ore filled the air, but very few tons fell in the big timbered chute built to receive it. Then the boys commenced gathering up ore all over the cut and on the hillside beyond, but after getting it all in the bins at the head of the tramway, and after firing a good many more blasts of the same sort, at the end of three days they quit, admitting there was no money in it at that price. The company sent up to D—— and got a *miner* to come down and figure on the same layout. He came, looked at the ground, sized up the situation and offered to break all the ore the company could crush at 33 cents per ton. He went to work, and, hiring Johnnie's and Jimmie's men, put down some deep holes, chambered them, and then charged them properly, and the result was the great mass of red gold-bearing rock simply slid down into the chute and was trammed to the ore bins as fast as it could be used at the mill, and faster. In another letter I must tell you of some timbering I have seen.

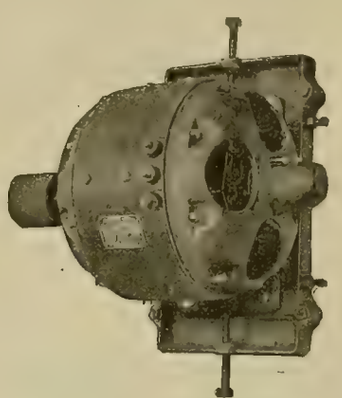
MINER.

Details of the New C. E. Motor.

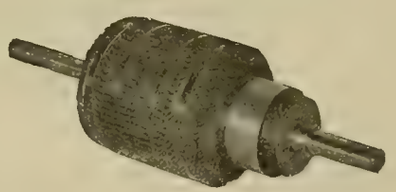
To meet a demand for larger direct current stationary motors as compact and efficient, motors of the type C. A. which range from ½ H. P. to 2 H. P.,



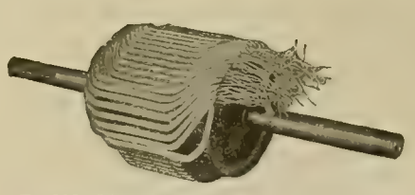
C. E. MOTOR.



C. E. MOTOR, WALL SUSPENSION.



C. E. ARMATURE.



C. E. MOTOR ARMATURE WITHOUT COILS.

the General Electric Company has still further improved a line of motors known as the type C. E., in which the motor frame, which is also the magnet yoke, is of soft steel of high permeability. It is cast in the form of a hollow cylinder with projecting feet on the outside and seats for the pole pieces on the inside. The short magnetic current which this arrangement gives and the use of the best material contribute to make the new motor efficient in all its capacities. To obviate eddy current losses the pole pieces are built up of iron laminations, and are secured to the yoke by through bolts with nuts on the outside. The field coils are held in place by the extended lips of the pole pieces and as the face of the pole piece covers a large surface of the armature, without increasing the size of the filed coils, the efficiency of the motor is materially augmented. The armature coils of copper wire, form wound, insulated and tested, are placed in the core slots, the ends of the coils lying along the flanges. This arrangement constitutes the cylindrical armature winding, providing a large ventilating surface for the conductors, reducing the length of wire necessary with consequent decreased resistance, and is thus conducive to coil running and high efficiency as well as to ease of removal and replacement of any coil. The insulation employed is that used with all G. E. railway motors and is tough, impervious to moisture and practically indestructible. The coils are securely held in a rigid position and injury to the insulation from sliding or vibration is impossible.

The bearings are supported by cast iron end shields. This method of support is lighter, but not less rigid, than pillow blocks; and, while affording protection to the working parts, does not lessen the compactness of the motor.

Slow speed in motors means diminished losses by wear and friction of belting, bearings and commutator; but as decrease in speed necessitates a corresponding decrease in output in motors of a given design, a reduction in speed requires a heavier and more expensive machine to give the same output.

The C. E. motors are built in capacities of from 2 H. P. to 10 H. P. in slow speeds and from 3 H. P. to 15 H. P. in moderate speeds. They are conservatively rated and will run under full load at an unusually low temperature. The standard type will deliver the rated output continuously without rising in temperature above 40° C. above the surrounding air. With the wire screens over the hand holes this will be slightly exceeded. The motors will carry a temporary overload of 40% without injurious heating. Following its usual practice the General Electric Company makes all parts of these motors to gauge, and duplicate parts can thus be obtained without delay.

The Advance in Copper.

The doubling of value of stock in the big copper producing companies is only a surface indication of the tremendous activity in copper mining everywhere. A product selling in open market for 18 cents and costing 6 cents per pound to produce is in active demand, and the world is being ransacked for this metal that electrical development has made so permanently valuable. Nothing but excessive production can check the present demand, and nothing (except prohibitory and extortionate figures) can quickly check the advance in price.

For nearly seven years increasing foreign consumption has sustained the American copper market; now that domestic requirements have been augmented, the price mounts still higher. Since '94 the American copper production increased from 160,000 tons to 234,000 tons; in the same time foreign production decreased from 90,000 tons in '94 to 85,000 tons in '98. Meanwhile exports of American copper have risen from 77,000 tons in '94, and 65,000 tons in '95, to 145,000 tons in '98, thus leaving for domestic consumption 83,000 tons in '94 and 106,000 tons in '95, and in '98 but 89,000 tons.

In addition it is to be noted that when the big French syndicate went to pieces just ten years ago it left 170,000 tons in the hands of the sub-syndicates of the bankers. Lake copper then fell to below 10 cents, and the bankers called for a conference with the leading American producers. The Calumet and Hecla people told them that if they wished to market their copper the price would be about 5 cents per pound, and they would be found willing to meet the market at that figure, with the Anaconda also in competition for the market. This was bitter, but resulted in an agreement that there be no restriction as to the price of copper, but the Calumet and Hecla and the Anaconda agreed not to increase their output in consideration of the bankers agreeing to market only a limited amount per annum for their accumulated supply.

That visible supply of copper in March, '89, has come down from 170,000 tons in the hands of the bankers' syndicate to a total world's visible to-day of 26,000 tons, and the world through a dull industrial period the past ten years has been absorbing 15,000 tons of copper per annum more than the world has been producing. Now on both sides of the Atlantic there is increased consumption, the smallest visible supply ever known, and little probability of new copper fields now being opened becoming immediate important factors in production. Meanwhile those who are trying to corner the market are taking a lesson from the dear-bought experience of the French syndicate, and, instead of trying to control the product, are attempting control or ownership of the mines themselves.

THE Pump Manufacturers' Association, in session in Chicago, has resolved to raise the prices of all pumps from 15% to 20%. The reason given is that the cost of material has considerably advanced.

The "Electro-Zinc" Process, and Experimental Researches Which Led to Its Development.

By W. BETTEL, Johannesburg, S. A.

Before describing my method of precipitating gold and silver by the "electro-zinc" process, permit me to refer to experimental work in connection with slimes treatment which led up to its development. As some of you will remember, I devised in 1892, a system for treatment of deposited slimes, where the separation of gold solution from the solid was effected by means of a washing filter press of special design, which in conjunction with Dr. A. Simon, I patented in this State in 1893. The first trial for percentage of extraction took place on December 14, 1892, at the Robinson Gold Mining Company's cyanide works in the presence of Capt. Mein, G. A. Darling, Dr. A. Simon, E. H. Johnson and others. The slime, selected by the cyanide works manager, Mr Darling, as being—in his opinion—the most difficult to treat, was mixed with a cyanide solution of about 0.2% strength in the proportion of 1.25 tons solution to one ton of dry slimes. To the solution was added potassic-manganic cyanide, in the proportion of 0.1 pound per ton of dry slime. As soon as the mixture was thoroughly pulped, it was pumped into the filter press (one of Johnson & Co.'s 24-inch frame machines with a washing attachment). The machine was so worked that the safety valve did not act until a pressure of 100 pounds per square inch was indicated, which took twenty minutes. The valve was then reversed, washing with water started, and continued until red litmus paper ceased to show alkalinity in the wash water; the pump was then stopped.

There being no facility for precipitating the gold from this cyanide solution it was decided to take the difference between the assays of orginal and residual slimes as proof of extraction. Eight assay tons of originals and the same quantity of residues were taken and assayed with the following results, which were checked by Mr. Darling: Originals 7 dwts. fine gold per ton; residues 3 grs. fine gold per ton: showing an extraction of 98.2% (theoretically).

Several trials were subsequently made, the total amount treated amounting to 3½ tons, and the lowest extraction (without washing) was 89.8%. An experiment with rich vanner slimes, containing ferrous and ferric sulphates and free acid, equivalent to a cyanide consumption of ten pounds per ton of dry slimes, was then tried, lime being mixed with solution for neutralization of acidity, and two pounds potassic-manganic cyanide added per ton of dry slimes, to oxidize ferrous hydrate and to facilitate solution of the gold and silver.

The mixture was agitated for 1½ hours, taking care to keep the solution alkaline (a previous experiment with part of the same slime had given unsatisfactory results, and nearly all the cyanide in a 0.2% solution was decomposed after five minutes agitation). The slimes were finely divided, 98% passing through a 10,000-mesh screen, and contained 30% pyrites.

The assay value of the original slimes was:—(dry weight) 7 oz. 13 dwts. 6 grs. fine gold per ton and of the residues 3 dwts. 12 grs. fine gold per ton: showing a theoretical extraction of 97.7% with a consumption of two pounds oxidizing agent and 3¼ pounds cyanide per ton. (The value of the oxidant was at that time, 1s. 9d. per pound).

A trial of half a ton of finely ground black sand from the Rietfontein Gold Mines, which had been treated by amalgamation in a Chilian mill, assaying gold, 2 oz. 17 dwts. 9 grs., gave a residue of gold, 1 dwt. 9 grs., equal to a theoretical extraction of 97.6%; 96.2% of this fine sand passed through a 10,000-mesh sieve.

In all the experiments, a small quantity of coarse sand was left in the agitator, from which not more than 20% of original contents of gold had been removed. No notice was taken of this residue, as it was assumed that in treatment on a large scale it would be removed if present to the extent of more than 2%, and treated as sand or concentrates.

The value of such a process, whereby, with the use of a moderate amount of solution, a high extraction of gold was readily obtained, using the ordinary zinc process for precipitation, did not however appeal to engineers in this country, none of whom had had experience in the separation of liquid from solids by filter-press treatment, and they were therefore disposed to exaggerate the cost of handling by the filter-press process.

It is true I recommended that only slimes of over 4 dwts. assay value should be treated by the filter-press process, as no means were then known whereby a rapid discharge of the pressed cakes of slime, by simultaneous separation (by a mechanical contrivance) of all the frames, became feasible. Such a drawback no longer exists, for after nearly six years' study of the mechanics of the filter-press process I have discovered a simple means of opening presses of any size, so that by one movement each plate (or as many as required) is separated from its neighbor a sufficient distance to enable the cakes of slime to be removed with great rapidity.

I anticipate, by this modification of the filter-press process, to be able to treat deposited slimes at a cost of 4s 6d per ton of 2000 lbs. dry weight, obtaining a 90% extraction, the plant being considerably cheaper than a current-slimes plant of equal capacity. This, however, is a matter for future consideration.

In the course of my experiments I found that although strong solutions of cyanide and alkalies effected the settlement of slimes, and ensured clarification of the solution, yet the same slimes, in dilute solution of these substances, refused to settle completely, the solutions remaining muddy for a considerable time. One sample examined did not clarify completely in three months.

Being desirous of obtaining a rapid clarification of solutions for purposes of decantation, I undertook a series of experiments with a view to finding a cheap flocculating agent which would not decompose cyanide. I found that soluble hydrated oxides which formed insoluble compounds with silica, such as hydrates of lime, strontia and baryta, to be the most suitable, but, for commercial purposes, lime could only be used, the others being too expensive. I thereupon tried a weak solution of cyanide, lime in excess and an oxidizing agent, and found that such weak solution would readily clarify, leaving the gold in solution. This pointed out means whereby poor slimes, deposited in dams, might be readily treated.

It then occurred to me to try the effect of flocculating of slimes by lime for co-precipitation of "float" gold. I will ask you to remember that when gold is finely divided, so as to cause it to remain in suspension in water for months, ordinary chemical precipitates fail to bring down more than a fraction of the gold.

From the rapidity with which the gold in slimes dissolved in weak cyanide solutions I concluded that the state of division of the finer particles of gold in slimes approximated to that of the particles which, prepared chemically, cause a pink coloration in water, or, as is suggested by R. Zsigmondy, is in actual solution as so-called "colloidal" gold.

I thereupon made a solution of gold containing 5 milligrammes of gold per litre and added thereto a reducing agent in sufficient excess to separate metallic gold in the pink state.

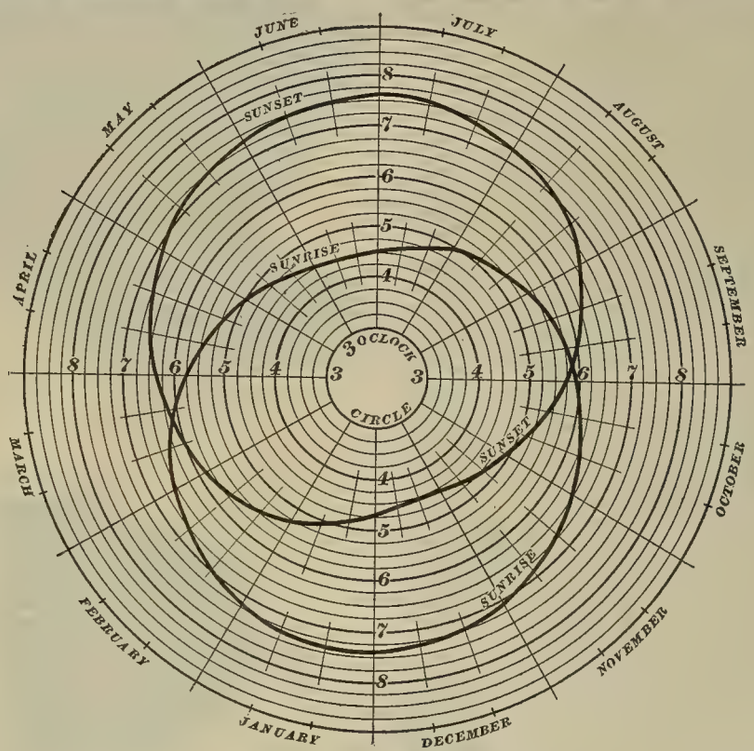
This represented the amount of gold in an actual slimes pulp, carrying 3% of slimes assaying 5 dwts. fine gold per ton. In this solution was diffused some slimes residues from my filter-press treatment containing no free cyanide and only 3 grains fine gold per ton, in the proportion of 30 grammes per 10 litres (= 2 2 gallons), and then 22 grains of lime finely ground—the lime was white and well burnt—the slimes precipitated carrying with them practically all the gold. The clear fluid filtered through Pasteur-Chamberland filtering candles showed, by assay, one grain of soluble gold per ton, the unfiltered liquid, perfectly clear, assayed only 1¼ grains gold per ton. I, therefore, felt sure that if slimes were flocculated with lime the gold would be co-precipitated, and many subsequent experiments on flocculation of slimes with lime confirmed me in this belief. Up to that time it was thought that float gold could not be precipitated by any means, and all who saw my experiments on slimes flocculation and made guesses as to the chemical agent used were always wide of the mark, for although lime had been used for neutralizing acid slimes, its flocculent effect when used in excess upon slimes effluents from dams had never previously been observed and noted.

At the time I made my experiments on treatment of current slimes the Molloy-Simon process, using electrolytically prepared sodium amalgam, was the only method likely to yield good results on dilute solutions, but the enormous area of the precipitant seemed then (as it does now) an insuperable obstacle to its employment.

(*To be continued.*)

A Chart for Sunrise and Sunset.*

The accompanying chart, by which, at a glance, the time of sunrise or of sunset for any day in the year can be quickly ascertained, is of interest. Those who understand the use of diagrams in general will appreciate its handiness, while an explanation will serve a double purpose with those who are not fully cognizant of the usefulness of such diagrams, showing not only how to use this particular chart, but illustrating one of the simplest methods of representing to the eye the rate and manner of change of a varying quantity.



SUNRISE AND SUNSET CHART.

Suppose it is desired to know at what time the sun will rise on the 10th of May: first find the slice of the chart marked *May*: the line dividing the April slice from the May slice is the last day of April. The 10th of May will, therefore, be one-third of the way over the May slice—reckoning thirty days to the month. The sunrise curve is marked *Sunrise*; concentric circles struck from the center of the chart are marked *3*, *4*, *5*, *6*, *7* and *8*; these represent hours; the space between every adjacent pair, as between the 4-o'clock circle and the 5-o'clock circle, is divided into four equal parts, each small space representing a quarter of an hour, or fifteen minutes. That is all there is to the chart itself. On the 10th of May, that is one-third of the way over the May slice, a radial line will intersect the *Sunrise* curve at a point just beyond the third quarter past the 4-o'clock circle, indicating that on that day the sun will rise at about 4:47 A. M. The short radial lines every third part of a slice help to locate any intermediate date.

*Condensed from Mechanic Arts Magazine.

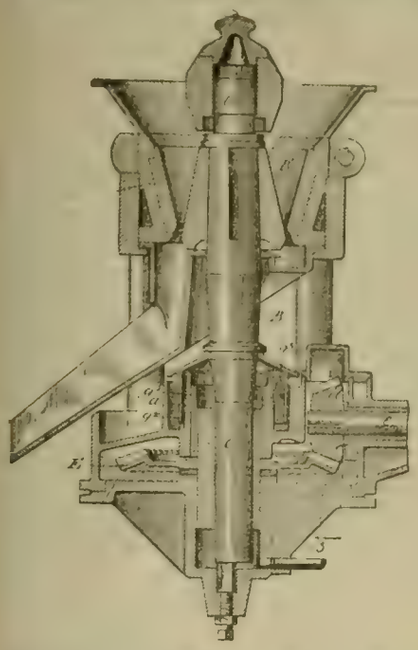
AT the Vulcan shipyards, Stettin, Germany, is now building the largest steamship in the world, "Die Deutschland." She is 622 feet long, 67 feet beam and 44 feet depth of hold. With bunkers and ballast tanks filled she will draw 29 feet of water. Her coal bunkers will carry 5000 tons. She will have two six-cylindered quadruple expansion engines of an aggregate capacity of 33,000 H. P. Twelve double and four single boilers will supply steam at 210 pounds pressure. The contract calls for a speed of 23 knots per hour, and it is expected that she will make 25 knots, or about 28½ miles per hour on her trial trip. Five dynamos will supply the necessary current for lighting.

Latest Mining and Metallurgical Patents.

Patents Issued February 7, 1899.

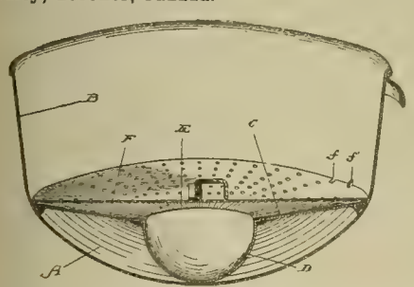
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK AND ORE BREAKER.—No. 618,860; P. W. Gates, Chicago, Ill., assignor to Gates Iron Works.



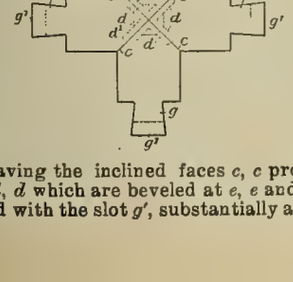
A combination of a gyrating shaft, a bevel gear provided with a hub in and by which the shaft is journaled and gyrated, a bevel pinion meshing with and adapted to drive the bevel gear, a frame portion surrounding the bevel gear and pinion providing a main oil reservoir beneath the bevel gear into which the bevel pinion dips, a portion of such frame surrounding the hub of the bevel gear and extending above the same so as to form a cup-shaped oil recess around the gyrating shaft, an oil reservoir adjacent to the bevel pinion into which the oil may be thrown by the bevel pinion and a channel leading therefrom to the oil cup surrounding the gyrating shaft so that the impact of the oil thrown on the oil in the oil reservoir forces it into the oil cup surrounding the gyrating shaft, and a channel leading from the oil cup to the main reservoir so as to promote the circulation of the oil, and a removable cap for the bevel pinion chamber provided with narrow end portions to concentrate the flow of oil to the vertical reservoirs.

PAN FOR WASHING GOLD.—No. 618,918; S. G. Stoodley, Toronto, Canada.



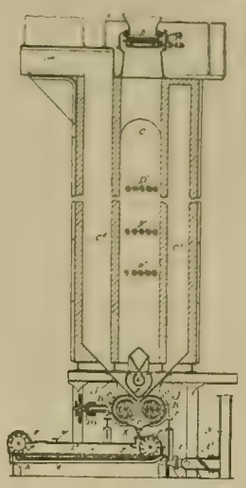
Consisting of a substantially semispherical-shaped bottom, a rim or side united to the bottom, the bottom gradually curving into the side, a concaved false bottom within the pan, a bowl located centrally between the false bottom and the true bottom, a central opening through the false bottom into the bowl, and a perforated plate or strainer supported above the false bottom.

DIE FOR MANUFACTURING OR SHARPENING STAR-BIT ROCK DRILLS.—No. 619,087; H. O. Palmer, Bolton, Eng.



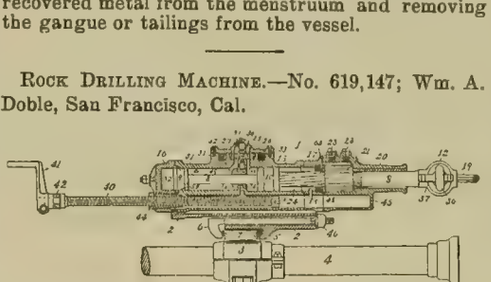
A die having the inclined faces *c*, *c* provided with recesses *d*, *d* which are beveled at *e*, *e* and the shank provided with the slot *g'*, substantially as described and illustrated; of a dolly-tool comprising a block or body with a suitable shank and having two V shaped grooves crossing one another, of four dies each having a beveled working face formed of two surfaces at right angles to one another and each surface having a recess which gradually dies away from its maximum depth at the outer end of the die, the deep end of the recess being beveled.

APPARATUS FOR EXTRACTING METALS FROM THEIR ORES.—No. 619,094; J. J. Shedlock, London, Eng.



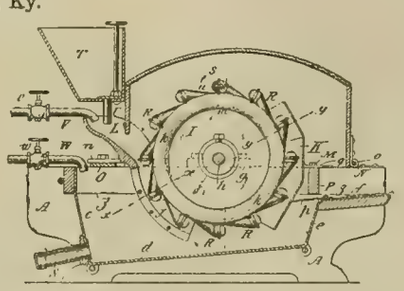
A process of treating ores consisting in delivering finely divided ore in a shower into a calcining chamber, heating the ore to the required degree as it falls and also subjecting it while descending to the action of successive fluid sprays issuing at varying points from top to bottom of the chamber between grinding and feeding rollers, then delivering the ore into an absorbing vessel containing a menstruum in which the metal to be removed is absorbed, separating the recovered metal from the menstruum and removing the gangue or tailings from the vessel.

ROCK DRILLING MACHINE.—No. 619,147; Wm. A. Doble, San Francisco, Cal.



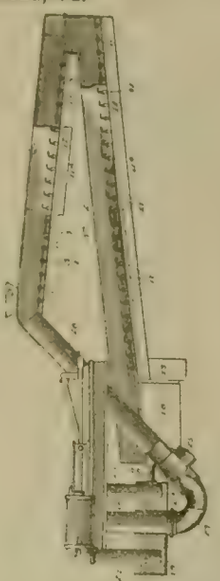
In this machine a main actuating cylinder is divided into two chambers by a midway partition, a piston in each chamber, these pistons being connected by a common piston rod passing through the midway partition, direct ports 28, 29 admitting steam or like expansive fluid to the inner ends of the pistons, a balanced valve controlling admission of such expansive fluid to the ports, an exhaust way 30, a parallel chamber 45 communicating with the exhaust way, and ports 58, 59, between the parallel chamber and chambers 57. There are a drill stem 8 and pistons 9 and 10, the slide distributing valve 25 with ports and passages to supply and exhaust air or steam from the inner ends of the pistons, ports 51 and 55 in the sides of the main cylinder and passages 53 and 56 leading to and supplying air or steam under direct pressure at the ends of the slide valve at predetermined points of and reversing the piston's stroke.

AMALGAMATOR.—No. 619,199; J. N. Marion, Louisville, Ky.



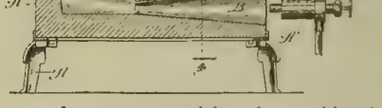
A combination of a quicksilver reservoir; a feeder tube through which the mass of combined liquid and solid matter, to be submerged in the quicksilver, is fed; a rotary wheel, or disk, provided with peripherally arranged piston-like devices that force the contents of the feeder tube downwardly through it and thence out into the mass of quicksilver in the reservoir, as specified, of the tubular housing, or tunnel, K, having its lower end submerged in the mass of quicksilver, having the diameter of its bore materially greater than that of the peripherally arranged devices, and having its upper end some distance above the top of the mass of quicksilver: through which housing the peripherally arranged piston-like devices of the said wheel, or disk, travel.

AMALGAMATING APPARATUS.—No. 618,938; V. Hanson, Richmond, Va.



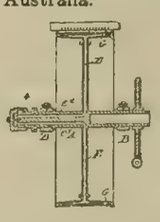
Comprising upper and lower oppositely inclined riffle boxes, transverse troughs having discharge nozzles outside of the boxes, strainers located outside of the boxes and extending longitudinally of the same at an inclination and arranged beneath the discharge nozzles, a collecting chamber located at the lower end of the lower strainer, a vat receiving the water from the lower riffle box, a dead-water tank having an overflow pipe connected with the vat, a pump having a depending take-up pipe extending into the tank, a feed pipe depending from the pump and a lift pipe extending from the feed pipe to the upper riffle box.

ASSAY FURNACE.—No. 619,044; Wm. Hoskins, Chicago, Ill.



An assay furnace comprising, in combination, a shell *A* divided into a rear crucible chamber *C* and a combustion chamber *B* and a muffle chamber *D*, in front of and communicating at their rear ends with the crucible chamber and the one with the other through an opening *r*, an opening *m* and an opening *m'* respectively near the front and rear ends of the top of the muffle chamber, a chimney *F* leading from the opening *m*, a tube section m^2 depending in the opening *m'* and a draught flue *F'* connecting tube section with the chimney.

FILTERING APPARATUS FOR SEPARATING GOLD AND SILVER BEARING SOLUTIONS.—No. 619,211; A. M. Nicholas, Bulong, Australia.



In a filtering apparatus, combination with a revolving wheel having peripheral closed compartments and provided with a circumferential covering of filtering material, of an exhaust pipe having one end open to a portion of the wheel shaft and successively communicating with separate longitudinal passages in the shaft as the wheel revolves, a series of hollow spokes leading from the shaft passages to the peripheral compartments, means for feeding the substance to be filtered upon the filtering material on the upper side of the wheel as the latter revolves, and water supply pipes to spray water upon the substance.

Latest Progress in the Application of Storage Batteries.*

NUMBER II.

By Joseph Appleton.

The weight of each cell is 6,200 pounds complete, and the total weight of the battery is, exclusive of copper conductors, 1,092,200 pounds. The battery is installed in the basement of the Adams street building. It has a capacity of 22,400 ampere hours at the eight-hour rate; the maximum rate of discharge being 11,000 amperes for about 1½ hours. Thirty of the eighty-three cells on each side of the three-wire system are end cells and are connected to three end cell switches on each side, so that, if desired, the battery can discharge at three different pressures. These switches have capacity of about 3,000 amperes each, so that they will fully take care of the maximum discharge of the battery; the connections between the end cells of battery and these switches are made by copper conductors 6″ x ½″, and the main connection of the battery of copper conductors, 6 x 1, giving a sectional area of 6 square inches.

The end cell switches are located near the battery and are operated from the distributing switchboard room by small electric motors, so arranged that when it is desired to cut in or out any number of cells it is simply necessary for the switchboard attendant to press a button, which will operate the motor and move the switch over from one contact to the next, the switch stopping automatically when it is in a proper position on any contact.

Both the short and long feeders running from the distributing board at Adams street can be supplied with the necessary voltage, 120 to 140 volts, to utilize their full capacity, making a large saving in the cost of the feeders. The charging of this battery is done over the tie line from the Harrison street station, no boosters being used. When charging, a pair of generators in the Harrison street station are disconnected from the system and connected to a portion of the tie line for charging the battery, the necessary voltage being obtained by speeding up the generator.

The battery carries about 11,000 amperes during the peak of the load, or about 26% of the total load. The advantages of batteries under these conditions will be readily seen, as they will take care of the maximum load during the short time it occurs, and will increase the load on the generators during the remainder of the time when they have to be charged.

This battery is used in addition to carrying the peak of the load for maintaining a constant pressure on the system, and relieves the switchboard attendants at the generating station from constantly watching and regulating the pressure, the battery taking care of any fluctuations automatically.

The use of large water powers as a motive power for generating stations from which electrical energy is transmitted and distributed over extended areas is growing. The power from such a plant is largely sold for manufacturing purposes, and is charged for at so much per horse power per annum, the power being available twenty-four hours per day. While the mills and factories using this power do not usually run for more than ten hours per day, therefore, a man who requires a maximum 100 H. P. for ten hours a day, or 1,000 H. P. hours, really has to pay for 2,400 H. P. hours, while be uses only 1,000, and probably less, for the average rarely, if ever, exceeds 70% of the maximum.

With a storage battery capable of supplying 50 H. P. for ten hours, or 500 H. P. hours, he need only pay for one-half the amount of 50 H. P. for twenty-four hours, and the battery will furnish the remainder, and can be charged during the fourteen hours he is not using the power. In addition to this, the battery will take care of any fluctuation above the average, and enable the man to buy the average amount of power he requires instead of the maximum.

Such an installation has been made by the Buffalo Street Railway Company. Before describing this installation I would like to mention the different methods of installing storage batteries in connection with railway plants. These may be divided into two classes:

First—Where the battery is installed at the power house to take care of the peak of the load and the fluctuation of the of generators.

Second—Where the battery is installed at the end of a long feeder to keep up the pressure at that point, and to obviate the necessity of sending the maximum amount of current over the long feeders from the power house.

We will consider an installation of each kind and their respective methods operation.

The Buffalo Street Railway Company's plant is of the first class, and is especially interesting inasmuch as it is operated in connection with the Niagara Falls power. They operate practically all the cars within the city limits, and have a steam plant capable of delivering 7,000 electrical H. P., in addition to which they take 2,000 H. P. from the Niagara Falls power, this current being transmitted in the form of high tension alternating current from the falls to the power house, and being then transformed by rotary converters to the ordinary 550-volt direct current.

The storage battery is installed at the main power house and is connected directly in parallel with the steam plant and rotary converters.

When a storage battery is installed at the power house, and is connected directly in parallel with the generators on the bus bars some means has to be provided for regulating the voltage of the battery to suit the generators. As you know, railway generators are over-compounded, the voltage rising as the load increases, while with the storage battery the reverse is the case, the voltage decreasing as the discharge increases. In order to make the battery work properly in parallel with generators of this type and take fluctuations of the load, keeping the generators constantly loaded, some means of compounding the battery has to be adopted. This is done by using a compound wound booster in series with the battery, which is so designed as to increase its voltage in proportion to the increase of load.

The battery discharges during the morning and evening peak, and is charged between times, also at night, from the Niagara Falls power. By the aid of the battery they are enabled to make very much more use of the Niagara Falls power. Before they installed the battery they were only able to shut down their steam plant from 11:30 P. M. until 5 A. M., during which time the rotary converters carried the entire load, which averaged about 600 H. P., while they were paying for 2,000 H. P. With the aid of the battery they are enabled to shut down their steam plant from 7 P. M. to 7 A. M., and about eighteen hours on Sunday.

An illustration of the second method of using storage batteries for railroad work is seen in the case of the battery installation of the South Side Elevated Railway Company of Chicago. This company operates an elevated railroad about nine miles long, all the trains being equipped with the Sprague multiple unit system. The power house is located approximately at the center, and the two storage batteries near each end of the line, and are connected directly across the system without a booster. The charge and discharge of these batteries are controlled by the drop over the feeders from the power house to the batteries, this drop varying according to the load on the system from 10 to 80 volts. When the load on the system is light, the drop in the feeders is small, and there is voltage enough to charge the battery. When the load becomes heavy, the drop on the feeders is increased; this consequently causes the batteries to discharge into the line. The method of operating is entirely automatic.

From a number of load curves it was ascertained that when the power house was operating without the battery during the peak of the load the maximum load was 7500 amperes, with sudden fluctuations of 5300 amperes, while with the batteries in operation the maximum load at the power house, under exactly the same conditions, was 5700 amperes and the fluctuations only 2000 amperes. Thus the batteries had increased the capacity of the power house by about 2000 amperes, and steadied the load on the generators to the extent of nearly 3000 amperes.

Those acquainted with the operations of railway plants will appreciate such results.

The switchboard is simple. Each battery is connected to the power house by two special feeders in addition to the general system of conductors, so that the proportion of charge and discharge can be regulated according to the conditions of the load. If it is found that a battery is being discharged more than it is being charged, an extra feeder is connected between it and the power house so that it will be relieved of a portion of the load. By this means a very complete control can be obtained of the battery from the power house, and the most efficient method of operation secured.

A battery installed at the end of a line in this way not only increases the capacity of the power house, and saves the investment in copper by making it only necessary to transmit over the feeders the average amount of current required instead of the maximum, at the same time maintaining the proper voltage at the end of the line, thereby enabling the motors to run at the point of highest efficiency. A variation in voltage at the end of the line between conditions of maximum load and minimum load of 10% is ample to make the battery self-regulating and take care of the fluctuating load without a booster. Statistics show that a storage battery installation of this description has much to recommend it from a commercial point of view.

One of the most interesting and important storage battery installations recently made is that in connection with the underground trolley system of the Metropolitan Street Railway Co. of New York. Their system covers a large area, and they have utilized storage batteries in sub-stations. Two are now in operation, one at the foot of West Twenty-third street, and the other at Thirty-second street and Fourth avenue.

I will briefly outline this plant and method of operation: The battery consists of 540 cells, each containing 51 plates, 15″ square. The dimensions of the cells are 4′x 21″x 24″. The battery is divided into two sections, 270 cells in each, which are operated in parallel. This is done to keep the size of the cells within practical limits and to enable them to be more easily inspected and cared for. A cell 8′ in length, which would be the size if only one battery were used, is too large to be satisfactory. The capacity of the complete battery is 8000 ampere hours, with a one-hour rate of 4000 amperes.

The function of this battery is to take care of a portion of the morning and evening peaks, and to take up the fluctuations of load at all times. The method of operation is as follows: Sufficient cells are provided so that the voltage of the battery just balances the average voltage of the system; consequently when the battery is connected to it it acts as an equalizer and does not charge or discharge except as the fluctuations occur. When the battery discharges on a peak and is being charged during the hours of light load, a booster is connected in series with it to regulate the amount of charge and discharge. The output of the booster and, consequently, the charge and discharge of the battery, is controlled by varying the strength and polarity of the shunt field. The daily work of the battery is about as follows:

From 7 to 9 A. M. it discharges on the peak. From 9 to 12 it floats on the system as an equalizer. From 12 to 3 or 4 P. M. it is charging. From 4 P. M. to 8 P. M. it discharges on the peak. From 8 to 12 midnight it is floating on the system, and after midnight the battery is given its principal charge, this being continued until the battery is full.

*Condensed.

An Improved Safety Explosive.

An improved safety explosive is reported from Germany. The *Revue Technique* says that according to the specifications of his patent O. Frank of Berlin proposes to employ permanganates in conjunction with ammoniacal saltpeter and carbonaceous matter for the production of safety explosives. He takes a smaller quantity than usual of the carbonaceous matter and substitutes for the loss about 10% of permanganate, the resulting explosive then having, it is stated, the same disruptive force as usual, but affording absolute security from ignition of the mine gases. A previous inventor employed bichromates for the same purpose, but it is now claimed that the permanganates are superior to the salts just mentioned. For instance, if two explosives be taken, the one containing eighty-nine parts of ammonium nitrate, seven parts of dinitrobenzol, and four parts of potassium permanganate, whilst in the other the same quantity of potassium bichromate is used instead of the permanganate, it will be found on explosion that for thin cartridges a No. 1 cap will suffice to fire the permanganate explosive, whilst for the bichromate cartridge a No. 6 cap will be necessary. With the permanganate explosive the leaden testing cylinder—Trauzl type—will be enlarged in volume by the explosion by 450 cc., the increase with the other explosive being only 3 80 cc. In point of safety the permanganate explosive is still more decisively superior. Thus 437 grammes of bichromate explosive suffice to produce the ignition of a 7% mixture of fire damp and coal dust. On the other hand, with permanganate no ignition is caused even with a charge of 600 grammes. If the same results are obtained on a large scale in practical work, the new explosive should prove very useful in dusty and fiery mines.

The Automobile.

On the front page of this issue appears further illustrated notice of the latest in motors. In every part of the world where roads or streets admit of such style of conveyance these electric and gasoline motors are finding their way; in some cases steam and compressed air furnish the motive power. During the present month incorporation has been effected of the New York Auto-Truck Co., with a capitalization of $1,000,000. The successful operation of the plans of this new concern means the displacement of the horse on large trucks, it being claimed that the use of compressed air motors, made especially for work of this nature, will produce more satisfactory results, and in the end be cheaper than horses. Compressed air motors, unlike horses, have no appetites. It is understood that these motors are to be manufactured at the works of the American Wheelock Engine Co., New York. Joseph Leiter, W. C. Whitney and the Rothschilds are interested. The motors will be built under the Knight-Hoadley patents. Experiments in this direction were first undertaken at the suggestion of a large New York mercantile concern that desired to replace its horses with some such device.

Notes on Experimental Metallurgy.*

By J. E. CLENNELL, Salt Lake City, Utah.

The cyanide process on the Rand has now become such a cut-and-dried affair that the field for experimental work appears to have been reduced to very narrow limits. Except in the department of slimes treatment, the opportunities for improved practice seem to be few indeed. This condition of affairs is in part due to the surprising uniformity of the material which presents itself for treatment, and partly also to the concentration of a very large amount of talent and experience on the same problems.

It is far otherwise, however, in a district where the ores to be handled vary from place to place, and where the difficulties encountered even in adjoining mines may be of a totally different character. As even in Johannesburg some of your members may occasionally be called upon to decide on the best system of treatment for a given ore, some account of the experimental methods which we have been led to adopt in this country may not be without interest.

If some of you find little or nothing new in what I have to say, I hope at least that points will be raised the discussion of which will prove valuable and interesting.

When the question arises, "How is the ore from a certain mine to be treated?" there are two preliminary enquiries which in America, at all events, must unfortunately be made in every case before it is safe to proceed a single step with the metallurgical problems:

First—Is there any ore to be treated?

Second—Is there anything of value to be extracted from it?

If either of these questions be answered in the negative, which I am sorry to say is only too frequently the case, the problem is naturally much simplified. It is much to be desired, however, that some means could be devised for rapidly solving these preliminary queries, if possible at the expense of the mine owner or promoter at whose instigation the examination is undertaken in the first instance. This is a promising field for research which has so far been but little exploited. Some time since a California mining paper published a formula which professed to give the relation between the statements made by the prospector, the distance and inaccessibility of the locality, the price demanded by the owner, and the real extent and value of the ore body, but I am afraid the "personal equation" enters too largely into such a computation for it to be of much practical value.

Let us suppose, however, that we have satisfied ourselves that there is something to be treated, and something to be got out of it; we have next to consider the general lines on which we are to go to work to extract these values in the most profitable manner possible. It has been well remarked that practical metallurgy is not the science of getting metals out of ore, but the science of getting money out of ores. Hence a process which may be complete and admirable from a scientific point of view may be worthless when it comes to a question of satisfying the importunities of stockbrokers.

So great is the interest in the cyanide process displayed throughout the whole world, and so touching the faith in its powers and possibilities, that the first question in nine cases out of ten asked by the person or persons interested in the real or alleged ore under examination is, "Can the ore be treated by cyanide?" In the remaining tenth case it is usually assumed without question that the ore can be so treated. If you begin to express doubts or suggest difficulties a certificate is often triumphantly produced, affirming that the ore was treated in such and such an assay office and an extraction of 99% or upward obtained by this universal solvent. Subsequent enquiry generally fails to elicit any information as to how that 99% was obtained, such details as fineness of crushing, strength of solution, time of contact, and proportion of solution to ore treated, being beneath the notice of that class of metallurgical experts from whom the certificate referred to is obtained. By dint of much cross questioning and considerable patience it may, however, sometimes transpire that the result in question was obtained on perhaps two ounces of material, shaken in a large bottle with about ten times its weight of 1% cyanide. The assay of the original is probably "guessed" from the supposed average of the mine, in which case it is hardly necessary to remind you that the wish is frequently father to the thought. The assay of the residue is obtained on a charge which never exceeds half an assay ton (*i. e.*, 14 58 grammes), and when the quantity of gold finally obtained is too small to be easily weighed, the eye is often the instrument used in determining its quantity. Here, again, there is fine scope for the personal equation. From these two data the extraction is then "calculated."

Where such methods are in vogue it is hardly surprising that experimental metallurgy is somewhat discredited, and that much disappointment and loss has frequently arisen when an attempt has been made to realize these laboratory results in practice. Indeed, it has happened pretty frequently that a mine owner will spend $100,000 or $200,000 in erecting a plant for treating his ore by a plant utterly unsuited to it, rather than risk $100 or $200 in systematic laboratory tests to ascertain whether the ore can be treated by that or any other process.

Those of you who have had the pleasure of investigating ores from the Leydenburg or Zoutpansberg districts will hardly require to be told that there are even some gold mines which are not "cyanide propositions." Where the problem is complicated by varying proportions of silver, arsenic, antimony, copper, zinc, lead, etc., in almost infinite combinations, it is evident that a solvent exhibiting more or less partiality for each of these ingredients is hardly likely to give such satisfactory results as when applied to a mixture of finely divided gold with practically inert material, such as silica and ferric oxide.

Roughly speaking, we may classify ores according to the system of treatment best adapted for them, as:

1. Smelting ores.
2. Concentrating ores.
3. Free milling ores.
4. Cyaniding ores.

Of course, the same ore may belong at the same time to two or more of these classes, as, for example, the Rand conglomerate, which is both free milling and cyaniding; but I propose to restrict the descriptive term to the process whereby the greatest percentage of the value is obtained, so that all ore from which 66% of the value is obtained by amalgalation, and 35% by cyanide treatment of the tailings after amalgamation, would be described as free milling.

The term "smelting ore" would be applied only to such ores as can be smelted direct without previous concentration.

"Concentrating ores" will be defined as those in which at least 50% of the total value can be obtained by concentration in a comparatively small percentage of the original weight.

Such a classification as the above is, of course, not scientifically exact, but some such preliminary division must be made to determine the lines which the subsequent treatment is to follow.

Naturally the first operation necessary will be to obtain a correct average sample—by no means so simple a matter as might appear to the uninitiated. The "average prospector" may be safely trusted to pick out a sample far above the average of the deposit which is to be tested—the more he knows about the character of the rock the more certainly will he smell out the rich spots, not necessarily with intent to deceive, but from sheer natural instinct, and the incapacity of realizing what is meant by an average. A mining expert of my acquaintance bases all his investigations on the philosophical maxim that "all good things are soft." If there be any truth in this principle, it will easily be seen that the method of knocking down ore with a pick indiscriminately, wherever you can get at it, will have a tendency to yield high results. Even the most accurate methods of mine sampling are at best very rough approximations, since most of the ore alleged in the expert's report to be "in sight" is,-as a matter of fact, out of sight, and practically out of reach for sampling purposes. But it will be needless for me to enter into details on the subject of ore sampling before such a society as ours, especially as we are at present discussing the treatment of ores in the laboratory. It will suffice to say that I have found the safest rules to be: take plenty of ore, and take it from as many different points as possible. In cases where it is possible to determine the exact limits of the ore body, and its dip and direction, it is, of course, best to take samples at right angles to the walls, but in all cases a more reliable result is got by separately assaying the samples from a large number of different points, and averaging the results, having regard to the estimated quantity of ore represented by each sample than by mixing the samples (however carefully they may have been taken) and making a single assay of the mixture. It may here be remarked that in estimating the size of the ore body the seller always includes everything that lies between the extreme walls, whether it be granite, limestone, shale or what not, but in taking the samples he carefully excludes what are in this country termed the "horses," and, indeed, frequently confines himself entirely to a streak of a few inches along one or other of the walls.

Let us suppose, however, that an accurate sample has been taken; the assay of this will at once decide whether it is worth while to consider the question of metallurgical treatment. A few simple tests will show us under what class the ore is to be included. High values in gold and silver, especially if associated with much galena or iron pyrites, will naturally indicate smelting as the best process to use. Lower values, associated with a moderate amount of heavy mineral, point to concentration as a likely method. A hand panning test, with assays of both products, often gives valuable information. In all tests the essential points to be determined are the percentage of the total original weight finally obtained as concentrates, and as tailings, and the percentage of the total original values going into each product. We might define the "efficiency of concentration" as the ratio of the latter datum to the former in the concentrates produced. If this efficiency is low in a carefully made hand test, it will be probably quite safe to assume that concentration on a larger scale will be still more unsatisfactory, and investigations in this direction may be omitted.

(To be Continued.)

Secret of Casting Copper Again Discovered.

Every little while the secret of successfully casting copper is discovered, this time by B. S. Summers, in the foundry of the Western Electric Co. at Chicago, who has, it is stated, applied for a patent for a successful process for casting copper. Chemists and workers in metals have been experimenting with this problem for many years, but complete success, it is said, has not been attained until within the last week. A Chicago statement is to the effect that in the foundry of the Western Electric Co. from 300 to 500 pounds of the metal are now being successfully handled in this manner each day.

So-called copper castings have been on the market for many years, but have contained a large percentage of foreign metals, principally zinc and aluminum, which render the articles far from perfect in the construction of dynamos, switchboards, and other electrical machines. They all have a low conductivity, the range being mostly under 50%. All contained at least 4% of zinc, for with any less portion of this metal in the mixture the castings were spongy and full of blowholes. The highest conductivity was in one case when 77½%, Mathieson's standard, was reached. The assertion is now made that the castings made at the Western Electric shops have been made of such poor copper that 99.92% conductivity has been obtained in one lot, and the average is more than 90%. A few impurities remain in the copper, but they are usually less than .35 of 1%, and sometimes .01 of 1%. Molten copper exposed to the air generates gases that prohibit good castings. These gases form blowholes in the mass, and the articles come out full of cells like a honeycomb. Sometimes the gases form to such a degree that the mass is pushed out of the mold to the floor. Mr. Summers adds some chemical mixture to the melted copper just before it is poured into the moulds that takes up the air in them and allows smooth castings to be produced.

Such a process would be of great value in electrical work. Copper is the only practical metal where high conductivity is necessary, and the purer the copper the better the results. Where pure copper was required heretofore, rolled metal was taken, and the articles cut out with saws in the shape required. The alleged discovery is possible to save in the weight of the metal, for in some places where a 3900-pound piece was formerly designed, a casting weighing 2600 pounds could be used. The difference in cost of working the metal would be a great consideration, for copper is worth twenty cents a pound.

The "rights" of the new process belong to the Western Electric Co. solely. The ancients are claimed to have tempered copper, and some claim has been made in the past to casting it. When Mr. Summers was asked if he was working on the process of tempering copper he remarked that this was the next thing to be done, but would say nothing in regard to any experiments he had made along this line. Mr. Summers is credited with having recently perfected the making of semi-steel, a union of steel and cast iron, with the cheapness of manufacture of cast iron and a great part of the strength of steel, and thus enabled his establishment to cut down the weight of dynamos and other machines.

Patent Office Statistics.

Commissioner of Patents Duell furnishes the following statement relative to the business of the Patent Office for the year '98, and the condition of the work at its close:

During the year there were received 33,915 applications for patents, 1843 applications for designs; 84 applications for reissues; 1659 caveats; 1796 applications for registration of trademarks; 316 applications for registration of labels, and 50 applications for registration of prints.

There were 22,207 patents granted, including designs; 60 patents reissued; 1238 trademarks registered, and 200 labels and 35 prints. The number of patents that expired was 15,548. The number of applications forfeited for non-payment of the final fee was 4363. The number of allowed applications awaiting payment of the final fee was 6824. The total receipts were $1,137,734.48, while the total expenditures were $1,136,196.20.

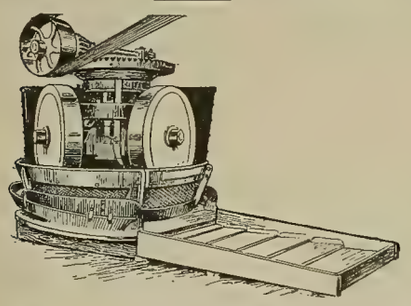
On Dec. 28th, '97, there were 11,382 applications awaiting action, while on Dec. 27th, '98, the number then awaiting action was only 5467. At the end of the year '97 the divisions were in arrears from five weeks to seven months, while at the close of '98 thirty-five of the thirty-six divisions were in arrears

only six weeks on new work and fifteen days on amended work, and the remaining division is up to them by this time.

The improved condition of the work of the office is owing to the fact that last June Congress granted a small increase in force, and to a large falling off in the number of applications received in '98, as compared with '97. The reduction in the number of applications received is due to two causes; first, the change of the patent law, which went into effect on Jan. 1st, '98, requiring inventors to file their applications for United States patents within seven months of the time of filing applications for foreign patents, which led to the receipt of an abnormally large number of applications during the last three months of '97. The second cause was the war. From April 1st the number of applications received decreased very rapidly, and most of the decrease for the year was within the following six months. This is but history repeating itself, as the records show that in '60 there were more applications for patents received than were until the close of the war in '65.

The number of patents granted to the Pacific coast during '98 was as follows: California, 619—1 to every 1951; Oregon, 73—1 to every 4298; Washington, 134—1 to every 2607. Hawaii since annexation to the United States has been granted seven patents.

A Notable Victory for the Bryan Quartz Mill.



As previously noted in the issue of January 28th, in the United States Circuit Court at San Francisco, on the 23rd, Judge Morrow gave judgment in favor of the complainant in the case of the Risdon Iron & Locomotive Works of San Francisco against L. C. Trent for a permanent injunction and an accounting. The matter in dispute was the infringement by the defendant of a patent on a roller ore crusher. Judge Morrow decided that the Bradley crusher of the respondent and the Bryan crusher of the complainant were practically the same invention. A perpetual injunction was granted and an accounting ordered.

According to this decision the Risdon patent is declared to be a pioneer invention and infringed by any one making, using or selling an ore crusher embracing a fixed vertical central shaft with flexible intermediate mechanism between the gear and rolls.

It is a truism that "the simplest things are always the best." The Bryan Roller Quartz Mill is the simplest of such mills, and in these days of many new inventions it proves that the old principles of mining upon which it is built are hard to excel, as it embodies all the advantages of the earlier machines, at the same time possessing the simplicity and durability that are required in mining machinery. As hereinbefore illustrated and described in detail, it has added to the principle of the Chili mill three rollers to run in a continuous discharging pan, and consists of an annular cast iron mortar fixed with steel dies arranged in the path of the three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to a stationary center post.

A few of its advantages are: It is easily, quickly and cheaply erected, requires little attention, crushes hard or soft ore equally well with small amount of power and little wear and tear of machinery, and, being simple, strong, cheap, does more and better work for less money and with less labor than many more pretentious appliances.

At present several hundred Bryan Roller Quartz Mills are in successful operation in this country as well as in Mexico and abroad, which shows how their merits are being recognized by those desiring such apparatus.

For proof that the Risdon Iron Works possesses great facilities for the manufacture of mining machinery, they take proper pride in calling attention to the fact that they are among the largest manufacturers in their line on the Pacific coast, having built a great number of quartz mills, among others the 240-stamp mill of the Alaska Mill & Mining Company, the largest mill in the world at the time, and also have put up some of the largest pumping and hoisting plants in this country, their machinery being in active operation in every mining district in the world.

They give due and timely warning to all whom it may concern that they will prosecute to the full extent of the law any and all infringements of their patent on the Bryan Roller Quartz Mill.

The Genesis of Petroleum and Asphaltum in California.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER.

Maltha asphalt, jew pitch, mineral pitch and brea are hydrocarbons which contain either sulphur, oxygen or nitrogen. They may contain one or more or all three of these elements in varying proportions. They can be produced synthetically by sulphurizing, oxidizing or nitrogenizing petroleum oils.

Oxygen, sulphur or nitrogen, when chemically united with a hydrocarbon such as some of the petroleum oils, produces a resin-like substance, to-wit, asphaltum.

One of the solid asphaltums when taken from the ground is brown, owing to its porous condition, caused by the evaporation of the petrolene. It melts at 245° Fahr. When it is melted it becomes black or blackish green. Another asphaltum when taken from the ground is black in color, shaded with brown, or red and dark green when sulphur is present. When purified it assumes an indigo blue reflection. It is opaque, scentless, tasteless and fragile, breaking with a conchoidal fracture, which has a glassy brilliancy. By rubbing it acquires a resinous electricity. Its specific gravity varies from 1.100 to 1.247. At ordinary temperature it is readily reduced to a powder. In a condition of extreme subdivision it takes a brownish tinge. It melts at about 105° to 108° C.

Immediately above its melting point asphaltum is volatile, and if the temperature is carefully raised it disengages in abundance white vapors which belong to oils, which become thicker in proportion as the operation is prolonged little by little, but slowly the volume of vapors diminishes, gas ceases to form, and a deposit of carbon, slightly bituminous, is reached, which is solid and has the appearance and often the hardness of jet. When subjected to quick distillation in passing on toward the dark red it sets free at the same time a mixture of brown oils, sometimes sulphuretted hydrogen and sometimes ammonia, while the retort retains about one-third of its weight of loosely compacted carbon. It is entirely insoluble in water; it gives up to absolute alcohol a small quantity of a yellow substance which exhales the odor of resin and has the appearance of resin. Ether extracts from it a brownish black substance called petrolene, and has the properties and consistency of maltha. The portion left by the alcohol and the ether is asphaltene.

The yellow substances, petrolene and asphaltene, do not exist in asphaltum in defined proportions. Sometimes the petrolene will represent two-thirds or more of the asphaltum. On the other hand, asphaltene composes almost exclusively other asphaltums. The properties of the asphaltums vary according to different proportions of these three principles.

Yellow Resin.—Absolute alcohol dissolves it without dissolving petrolene or asphaltene; it is also readily soluble in the solvents of petrolene and asphaltene. It has an appearance of a resin. When the solution in alcohol of the yellow resin-like principle is treated with liquid ammonia it produces an abundant white precipitate, while small globules of petrolene spring up from the bosom of the liquid and come floating in greenish yellow lentils to the surface.

Petrolene.—This is brownish black in color and has a soft and glutenous consistency. It is insoluble in absolute alcohol. Ether, benzine, benzene, acetone, and the fat oils dissolve it and the yellow resin, but leave the asphaltene intact.

Petrolene is also soluble in the solvents of asphaltene. The specific gravity of petrolene at 21° C. is 0.891. It burns with a very sooty flame. It has but very little taste.

A highly concentrated solution of caustic soda or caustic potash, when hot, dissolves petrolene; if some diluted sulphuric acid is poured into the liquid, a brown gelatinous substance is precipitated.

A current of chlorine precipitates the petrolene from its solution in benzine or in turpentine in brown and viscous flakes. These precipitates contain chlorine, and do no give anything further to alcohol or ether.

Hydrochloric acid precipitates petrolene from its solution in benzine in thick flakes; sulphuric acid in a solid and viscous deposit, which is transformed in time into a brownish red.

In making the experiment with sulphuric acid, the acid must be carefully and slowly added.

If asphaltum be kept at a temperature of about 250° C. by means of an oil bath until it no longer loses by weight, the petrolene is evaporated from the asphaltene.

Asphaltene.—Heavy petroleum oil, carbolic acid, turpentine, chloroform and bisulphide of carbon dissolve it without residue. It burns like resin, leaving coke. It is black, brilliant, and breaks with a conchoidal fracture. In the fire it only becomes soft near 300° C., and decomposes before completely melted. When torrified upon a platinum plate, it diffuses an odor of burned fat, afterwards of a sharp taste, which reveals an acid. It is solid, hard and fragile. When pulverized, it presents a mass of purple color, oftener of a brownish red. It develops, by friction, resinous electricity. In some of the asphaltums analysis has disclosed a large proportion of oxygen, in others a large proportion of sulphur. A current of chlorine precipitates the asphaltene from its solution in petroleum oils and turpentine.

Asphaltene is not sensibly affected by caustic potash or caustic soda in a concentrated solution in water.

The Formation of Asphaltum by the Resinification of Petroleum Oils.—When petroleum oils are left for a long time in the presence of oxygen gas, or the atmosphere which contains oxygen, and in the light, they absorb oxygen; some carbonic acid is set free, water is formed, their odor becomes weakened, and they likewise become viscous while they assume a darker and darker color. When petroleum oil is heated in a current of oxygen it undergoes a quick change and turns into petrolene.

If a current of sulphuretted hydrogen is conducted into boiling petroleum, a very mobile sulphurized liquid is distilled, having an unbearable odor of onions. If this treatment is repeated with the new compound, a second portion of the sulphuretted hydrogen comes to reinforce the former and the odor of the liquid becomes that of garlic. When this sulphurized oil is evaporated a resin is formed.

If petroleum oil is changed by the compression of sulphuretted hydrogen, and then the sulphuretted hydrogen be decomposed to sulphur and water, the oil will be sulphurized and resinified.

If petroleum oil is distilled in the presence of sulphur, the oils will be decomposed and sulphur compounds formed in the shape of a resin. Petroleum oil treated with nitrous gas absorbs it with a slight development of heat; the petroleum becomes thicker and is partly converted into resin.

All the petroleum upon which azotic acid is caused to act furnish yellow resins.

If petroleum is boiled in a cencentrated solution of nitrate of potash or of soda the nitrate converts the bitumen into resin and the liquid becomes a brownish red.

Polymerism of Asphaltum.—By exposure to daylight asphaltum polymerizes, that is, it acquires a higher molecular weight retaining the same atomic proportions. The stronger the daylight the more rapid polymerization takes place. When polymerized its molecule consists of two or more simple molecules united to form a complex molecule. It can be changed from a state of polymerization to its original or simple state by heat.

Polymerization is much more rapid and conspicuous with asphaltene than petrolene, the part of asphaltum soluble in alcohol does not polymerize.

Polymerization is more rapid and greater in asphaltum containing sulphur than in asphaltum containing oxygen. When polymerized the physical properties of the asphaltum are changed, it has a greater specific gravity, it is harder and more brittle, but the most marked change is that of becoming insoluble, or, to speak more exactly, of being dissolved with greater difficulty in its solvents than when not polymerized.

Asphaltum, on account of this photochemical action, is used in photography.

If a moderately concentrated solution of asphaltum in spirits of turpentine or chloroform be placed in a transparent bottle and securely corked, and then exposed for some time to the light of the sun, resinous substances separate and gradually appear which dissolve with greater difficulty in these solvents. If heated they dissolve: the greater portion of these separated substances adheres firmly to the sides of the bottle, a smaller portion remains in suspension in the solution.

Colored resinous substances will form in the California petroleums of commerce if exposed to light in the manner described above.

Solutions of asphaltum which are to be employed in photography must be kept in the dark.

Asphaltum is employed in photography in the following manner: When the solution of asphaltum with turpentine or chloroform is spread over a plate and left in a dark room until it becomes nearly dry, which will require a few days, and the plate exposed in a camera or placed under an object in contact with it, the time necessary to make the print varies very much and can only be ascertained by experiment. When printed the development is effected by quickly flooding with spirits of turpentine, which will at once dissolve the asphaltum, which has been protected from light, and partly dissolve that portion which has been exposed to the light. As soon as the subject is seen to be fully developed a gentle stream of water from a tap is allowed to flow over it to wash off the turpentine. If all operations have been conducted rightly a very delicate and perfect picture in asphaltum is the result.

(*To be Continued.*)

Mining Summary.

ALASKA.

The North American Transportation & Trading Co. is getting ready for extensive hydraulic mining this spring.

J. C. Green of San Francisco has finally succeeded in preliminary work of getting a railroad from the mouth of the Fish river, on Guildfrion bay, to his mines, the farthest north of any similar deposit. The distance is about thirty-five miles. There is a big body of ore in the Omalik group, 75% lead. Green has owned the property for many years, and run sailing vessels between the Fish river and San Francisco.

Paying placer ground is reported discovered eight miles to the interior from Fort Wrangel. Colorado men are said to have bonded a number of the new claims, which are located in a basin, for $75,000, paying $10,000 cash. This particular basin contains twenty-four claims, and it is stated there are twenty-five or thirty other basins of similar size and carrying placer gold in paying quantities within a radius of twenty-five miles of Fort Wrangel.

The report of the Alaska-Mexican mine shows 14,795 tons ore crushed and 104 tons sulphurets treated in January. The ore averaged $1 88 per ton; the bullion shipment was $21,023, exclusive of $5560, account of Alaska-Treadwell mine; expenses for the month were $24,844.

The Alaska-United mine report for January shows 13,104 tons ore worked and 350 tons sulphurets; the ore averaged $3.61 per ton; bullion shipment for month, $30,740; expenses, $21,463.

ARIZONA.

T. W. Tonking in the Oro Blanco district, at the Nil Desperandum, says during the last few years they have milled over 500 tons of ore there averaging $35 per ton.

The Graham *Bulletin* hears that the Detroit Copper Co at Morenci will shortly install an 800-H. P. gas plant at their works there.

F. A. Huntington of San Francisco has bought the Virgin copper mine in the Patagonia mountains near Crittenden for $40,000.

Silver Belt: The Old Dominion C. M. & S. Co., which shut down its smelter Dec. 8th last on account of the severe snowstorm and scarcity of fuel wood, is preparing to blow in one of its furnaces again. The *Republican* says the Old Dominion C. M. & S. Co. at Globe are now loading twenty cars with copper, twenty-five long tons to the car, which amounts to 1,120,000 pounds, worth $230 per ton, or $115,000 for the entire shipment. This is perhaps the largest single shipment of copper ever made from Arizona.

Republican: J. Breen and G Mitchell, superintendent of the United Verde Co.'s smelters have concluded a deal by which a lot of copper claims owned by Mr. Breen near Santa Ana, Sonora, have passed to Mr. Mitchell in consideration of $250,000. Mr. Mitchell already owned adjoining property, so that altogether he has a group of about 170 claims. The ore is of an exceedingly rich quality, some of it running as high as 23%.

Journal-Miner: The strike in the Crowned King mine seems to be true. In a letter written by Lester Jackson from the Bradshaws, he states that a 10-inch shoot of ore on the 500-foot level of the Crowned King had been run onto, which gave the marvelous valuation in assay of $180,000 per ton. The extent of the chute is not given but the ore was being taken out and sacked for shipment to Prescott. He also states that for the first time in many years, or since the memorable Peck excitement in the '70's, there was a revival of the old time interest and that in every section of the Bradshaws the mining element were to a man very much excited over the strike. The Crowned King has been rated for some years as one of the permanent and profitable producing gold mines of Yavapai county, and lies in a basin of the Bradshaw mountains and by trail about thirty-five miles south of Prescott. Its active life dates back but a few years, but in that time it has been steadily producing, having what is termed a strong fissure vein and remarkably rich shoots of ore varying in size. In its early life the King was a difficult mining proposition to handle in process of reducing its ore, owing to baseness, but as depth was reached the character changed so as to permit concentrating by the vanner process, and with continued development in depth the grade of gold has likewise improved in value, running from $14.35 in the upper workings to nearly $15 per ounce in the deepest. At present a 10-stamp mill is operated near the mine and the concentrates and amalgam from it freighted by teams over the mountains.

Prescott *Courier*. It is reported upon good authority that J. H. Costello has made a deal for the Milliken and Comer properties for a sum said to aggregate $50,000, and if the transaction is completed, assurances are given that extensive development will be done on both groups.——The report of the rich strike in the Crowned King mine has been confirmed; 8 inches of unusually rich ore has been struck on the lower level of the mine. The average value of the ore is not known, but some of it is said to assay $100,000 gold to the ton.

CALIFORNIA.

Alpine.

The Exchequer mill was recently sold for $825 to an English company.

Amador.

The new officers of the Kennedy M. & M. Co. are J. Barton, Pres.; D. E. Hayes, Vice-Pres.; E. C. Hutchinson, Sec'y; J. F. Parks, Supt. Work on the north shaft of the Kennedy is being pushed.

On the Adams property at Mt. Echo a nugget worth $185, 4¾ inches in length and from 1 to 2¼ inches in width, is reported.

The officers of the recently organized Peerless G. M. D. Co. are: H. Osborne, Pres.; G. G. Gates, Vice-Pres.; E. Ginocchio, Treas.; W. E. Downs, M. E.; G. W. Brown, Sec'y. There are to be 150,000 shares, par value $2 each, 100,000 to be disposed at an average of payment not to exceed 2 cents per month - first payment 3 cents. The promoters get 50,000 shares, turning over to the company a five years' bond on the Badanacco ranch, total price $20,000. Jackson men have bought some of the shares.

The *Ledger* reports twenty stamps crushing at the Bay State mine, Plymouth mining district. The mine is clear of water and the work of sinking is progressing.

The *Ledger* says: "A part of the output of the January run of our mines, $60,000, was shipped below last Sunday, two days in advance of the usual date; hence the bandits, had they been successful, would have secured a comparatively empty box—less than $2000 probably."

Record: The South Spring Hill mines at Amador City will probably soon again be operated as usual. The company is now, through Supt. J. R. Treglean, squaring up its indebtedness as rapidly as possible.

Butte.

On the north fork of the Feather, D. M. DeLong is getting out gold from ten miles of river bed worked by the company of which he is superintendent.

At Union the dredge on the Mortenson place is about finished. Since the advent of the dredge system there land that was not considered to be worth its tax value is now being mined and ranges in price from $40 to $60 per acre.

Calaveras.

A new town is building near the Royal mine about three miles from Copperopolis. Heretofore the Royal mine has made its headquarters at Copperopolis, but as soon as Hodson is christened it will be changed to that town.

El Dorado.

The sluice boxes of the Blue Rock mine, at Georgia Slide, were robbed during the night recently—the first time they have been disturbed in sixteen years.

Inyo.

At Tuber canyon, Panamint, the Montgomerys have milled the dump, all that came out of two deep shafts; it averaged $26 per ton. Phœbe & Co. of San Francisco have a bond on the property.

Kern.

The works of the California Borax Co. are about completed and are expected to start up during the present week, and will make the first shipment of their product this week. They will ship about 100 tons of refined borax per month.

A strike is reported in the Annex mine, at Randsburg, of a 20-inch vein of $100 rock.

At Barstow the management of the mill has made contracts which will keep the fifty stamps busy throughout the year. From all points north of Barstow the present rates are, including freight from Johannesburg to Barstow and cost of milling, $2.50 per ton on ore valued at less than $15 per ton, $3 for $20 ore, $4 for $25, and $5 for $35 ore.

Randsburg *Miner*: The Butte mine people have settled their difficulties and the mine passed back again into the hands of the original owners. J. C. Wilson has held the property for nearly two years under a bond of something like $50,000, but now he has given it up, and Rainey & Underhill, who are now here, will at once make arrangements to go to work on it themselves.

Los Angeles.

G. E. Metz and F. B. Brown have sued N. Bell for $10,000, alleged to be due as commission on the sale of a mine in Pinos Altos, Grant county, New Mexico, to Mrs. Phebe A. Hearst of San Francisco for $85,000.

Times: From the Red Rover mine, near Acton, a gold bar was received of the value of $1449 60. Since then assay of ore from the 300-foot level shows values higher than any of the rock heretofore milled. The bar weighed 90¾ ounces and was the result of a run of 125 tons; 20 tons came from the 100-foot level and 105 from the 300-foot level. The directors have decided to go down to the 1000-foot level. Among the improvements contemplated is the piping of water from Mt. Gleason. It is also the intention to increase the milling capacity from ten to twenty-five stamps. The Red Rover is the deepest mine in southern California. Among the stockholders of the company are Senator Stephen M. White and Governor Gage.

Mono.

The California Assembly last Wednesday passed the Senate bill appropriating $20,000 to build a wagon road from Mono lake to connect with the Tioga wagon road, owned by the National Government, and running through Yosemite Park reservation. At present, miners living in Mono, Inyo and Alpine counties cannot get across the mountains into the Sacramento or San Joaquin valleys.

Last Monday at Bridgeport the thermometer stood 20° below zero.

Bridgeport *Chronicle*: On Tuesday while two miners named Perkins and Ross, leasers of the Standard Con. ground at Bodie, were working in a drift from one of the Standard shafts, a cave occurred in the shaft which prevented them getting out. The Standard folks set a gang of men to work in another shaft 40 feet from the caved one to drift through to where the men were imprisoned and rescued them. They drilled through the 40 feet of ground in thirty-eight hours and rescued the men, which was remarkably fast working.

Nevada.

Near Nevada City the Odin M. Co. is building a gravel dump and sluice boxes at their mine, preparatory to beginning operations.

At the Pine Hill mine Supt. Rosenthal tells a local reporter that instead of a 10-stamp mill, as intended, a 20-stamp mill will be erected this spring.

The Spanish Con. Quartz M. Co. has been incorporated by Messrs. Fetz, Schuster, Ott, Schuk, Assion, Steinegger and Kurtsschoke, to work the Spanish mine, capital stock, $100,000, all subscribed.

At the Gold Hill Co.'s property at Grass Valley 3 feet of ore samples $17 50 gold, three ounces silver. Milling of ore begins May 1.

The Kate Hayes M. Co. will soon begin building a dam at Badger Hill.

Hydraulicking is to be resumed in the Sazerac gravel mine, near Nevada City.

Most of the Nevada mineral exhibit at the Trans-Mississippi Exposition has been donated to the University museum.

The *Herald* hears that at Omega everything is at a standstill for lack of water. They have plenty of snow, however, and will have water after awhile. On Diamond creek are several drift mines that will then be worked when the water comes. Porterfield Bros., at the Last Chance, have their mill ready for work. At Omega, J. R. Ritchie built a mill over a year ago, but has never been able to run it for lack of water.

Tully Bros. have made preparations for a summer's work at Omega, and hope to open up a good drift mine.

Grass Valley *Union*: The Brunswick M. Co. is arranging for deep working and is putting in a double hoist. The foundations will be of solid concrete 8 feet deep and 12x18 feet in width. The company has 1500 feet of new 14-inch No. 12 double riveted steel pipe.

Placer.

At Alta most of the gravel mines are working steadily. The Fairmount quartz mine ore, in Blue Canyon, runs $6 and $7 a ton, most of it free milling. A 5-stamp mill operates steadily. P. Laveau is the owner.

J. Nicholson is Supt. of the Hobart mine.

The Pioneer mine, near Damascus, has a shoot of paying ore which is uncovered at the 500-foot level and again at the 1000-foot level. A winze is sunk 200 feet below the 1000-foot level, where it shows that this ore body holds. This ore averages $11 per ton. Water is sufficient to drive the mill, which has twenty stamps, and it is proposed to double the capacity this summer. The earnings of the mine for the current month will make a good showing. The newly installed electrical machinery works successfully and is a saving in operating expense, as well as the increasing of the mine's productive capacity; 1200 tons a month can be easily crushed. The company will drive a new tunnel at the 1500-foot level as soon as the weather permits.

Herald: Work is still going on at the Eureka mine. The width of the channel at that particular point has been determined by upraises to be 100 feet.——Lack of water prevents work at the Big Gun.——The Centerville mine is paying splendidly.——The Pioneer continues to yield good paying ore.——The old Dardanelles is being worked by lessees. They are trying to pump out the old shaft and hunt for the back channel.——At Yankee Jims no mining is going on for lack of water except at the Anthony Clark mine in Georgia Hill. The tunnel is in 500 feet, and the upraises show a channel of moderate richness; but as only the edge of the channel has been reached, it is not a fair test of the mine. ——According to report, rich gravel has been struck in the Mayflower mine on the Orono lead at a point adjoining the Grinnell mine. There is sufficient water to run the compressors only. As soon as water comes, the company will begin hydraulicking the upper or Young America lead.——At the Crandall mine a new track has been laid the entire length of the tunnel. The new mill will be ready for use by the first of the month. The stamps will weigh 1100 pounds each, and the dies are one inch larger in diameter than those of any other battery in the county. The machinist warrants the battery to crush twenty-five tons of rock a day. There will be five stamps, and the mill will have a capacity of forty, if needed.

Riverside.

The Riverside M. Co. contemplates building a cyanide plant at its Granite group, forty miles from Salton. The Granite has about $15,000 worth of ore on the dump.

A new gold field in the Mountain Beauty mining district, in the southern end of the San Jacinto mountains, is partly in San Diego and partly in Riverside county, forty miles south and east of Hemet. The nearest point to the district is Oakwood. The formation in the district is granite and schist, the trend of the lodes is north and south. Two tunnels on the Mountain Beauty are in ore averaging $10 a ton.

Sacramento.

Colorado men this week launched a mining dredge in the old channel of the American river near Folsom on Mississippi bar, in an excavation filled with water from the North Fork ditch. It cuts its own way through the gravel beach, which is about 100 acres in extent. It is calculated to raise and wash 2000 cubic yards per day, and the gravel is expected to yield 18 cents per cubic yard. The cost of raising and working the gravel is estimated at 6 cents per yard.

San Bernardino.

A syndicate has been formed to work the placer grounds of Temple bar on the Colorado river, 150 miles above Needles, and at the mouth of the Grand canyon. The company has shipped out a boat 175 feet in length, which is now being put together at Needles, and will ply between Temple Bar and Needles.

San Diego.

Yuma *Sun*: The sudden and unexpected closing down of the mines and mill at Venus camp, Pichao district, twenty-five miles north of Yuma on the California side, has set afloat all sorts of rumors as to the probable cause. Mr. Blaisdell's explanation, that threatened trouble by heirs of the Jaynes estate who have appeared on the scene of action since the deal for the property was made, should be sufficient explanation of the shut down.

Union: The Elevada gold mine at Banner has been sold by C. F. Holland to parties whose names have not been made public.

Sierra.

J. C. King has returned to Salt Lake City from Downieville. While there he settled all claims held against the owners of the Ed Lewis mine, and next spring will develop the property. The Otsego G. M. Co., owning it, was recently incorporated under the laws of Utah.

Supt. Garnier of the Kenton mine, near Alleghany, reports completion of the mill, which will be started as soon as the weather favors.

Shasta.

Development work on the Eureka Tellurium mine, near Middle Creek station, progresses. P. Scherer, the owner, expects to tap a shoot of telluride ore.

The Mountain Copper Co. is trying to secure control of Pitt river.

The Mt. Shasta Milling Co. has finished stringing wire upon poles from Montague to the site of the former mill, near Little Shasta river, two weeks ago. Three No. 8 copper wires as an alternating current of high voltage is used to run a 40 H. P. dynamo at the mill in Montague.

The Shasta *Courier* says that the outlook for placer mining in the vicinity of Shasta for the season is poor. A wet season, however, would help the industry considerably.

Searchlight: It is thought that J. Sallee has made a deal whereby his Copper City holdings will pass into the hands of a syndicate. ——The White Oak mine has shut down pending the installation of a heavy steam plant. ——The Milkmaid mine at French Gulch is not to be worked. Senator Jones and his coowners would not give a lease that would permit of their working through the old tunnels. ——The Minetta B mine expects a profitable run the coming season. They have been engaged during the last two months in working off the top dirt and will commence on the gravel at once. They are using 2500 inches of water; the same amount is going to waste. J. T. White is Supt.

Siskiyou.

News: There is a good supply of snow on the summits.——At the gravel claim of Wilson Bros. & Kennedy on Eddy's gulch, Salmon country, good gravel is being sluiced. ——The Casey claim near Sawyer's bar is being worked by Hamilton & Marchand, with the prospect of a successful season.——A rich bunch of ore was taken out in a day and night this week at the Jillson & Roberts mine that yielded $3500.——The Oro Fino hydraulic mine has temporarily closed down on account of the cold weather.—— McCarty and Hadley recently found good pockets in their claims near Scott Bar, taking out $750 and $350, respectively.——The Summerville Co. is getting ready to pipe their recently purchased ground in the Cecilville section, and Colburn Bros. are getting ready to ground sluice the bar between the banks of Cecil creek near Cecilville.——The mill at the Cherry Hill mine on Cherry creek will be started up as soon as a short piece of road between the mine and mill is put in order.——Piping is going on day and night at the George Ziteman mine in the Cecilville country. This property is being operated by Morris & Johnson, who have it leased.——The Campbell placer property at Quartz Valley is now ready for a run with plenty of water.——Sinking is going on steadily at the Quartz Valley property recently bonded by Mr. Thornton of David Jones. A new boiler, engine and hoisting plant have been put in and a new mill is spoken of.—— The claim recently discovered by R. Luddy on the Salmon is being developed. A 10-stamp mill will be put in the spring.——Fifteen men are employed at the Bunker Hill hydraulic mine below Happy Camp. They are making extensive preparations for a big run. S. Gardiner of Oro Fino is Supt.——J. W. Martin has bought a half interest in the Fort Goff placer mine for $2500.——The Siskiyou hydraulic mine below Happy Camp had a 312-foot break in its flume some time since, caused by a slide. The repairs are completed and piping is now going on day and night, with fifteen men employed. The company owns 1200 acres of ground. They worked off eight acres last year, the last cleanup averaging $500 a day for a twenty-day run.——The extreme cold weather of the past few days has frozen up ditches, sluices and small streams, stopping mining except in the tunnels and drifts. The cold weather, however, will be beneficial in freezing the soft snow on the mountain tops, and also the streams, lakes and ponds from mountain springs, to melt during the spring and summer months, in furnishing a supply of water until late in the season.——A good-sized pay shoot is opened at the White Swan mine on the Salmon.——At the McArdle & Elliott mines, placer properties near Cottage Grove, work has been going on about a year, getting ready, and a large amount of money has been expended. Great results are anticipated.——At the Cherry Hill, Cherry creek, the pay shoot was recently crosscut at a depth of 452 feet below the surface, showing a width of from 4 to 5 feet. The management estimates the quantity of ore in sight between these points at from 10,000 to 14,000 tons. It is proposed to run on the ledge from the opposite side of the hill, 250 feet below the crosscut tunnel, giving a total depth of 702 feet.

Yreka *Journal*: Copper is reported discovered near Gazelle. Copper strikes have also been made at Preston peak.——The hydraulic, quartz and placer miners are getting ready to start up work again, since the change from severe cold to warm weather, which causes the snow to melt and supply water, so greatly needed for any kind of mining.——At Cottage Grove on the lower Klamath the Chicago Co. is fitting up an extensive hydraulic mine.——A. Wilder at Orleans bar occasionally finds nuggets of platinum.——A dredge is to be built and placed in Klamath river at Orleans bar. As the river is too heavy a stream for wingdamming in a portion of Siskiyou county, and all of Humboldt and

Del Norte counties where it touches, the best method of reaching the channel bedrock gravel is by dredging and raising it to sluices for washing.——A fine stringer of quartz has been found in the tunnel now being driven into the Golden Star mine on the north fork of the Humbug, formerly the old Spencer mine.

Tuolumne.

The San Guiseppe mine, Sonora, is soon to start up.

The Black Oak M. Co. is to supply Soulbyville with electric lights.

C. J. Berry, G. T. Turner and associates, California miners recently from the Klondike with considerable money, have bonded the Standard mine near Sonora and let a contract to run a tunnel 100 feet.

The first payment of $1000 has been made on the Leap Year gravel mine on Table mountain, recently bonded by Hawley, Cook, et al., and work on the property will soon begin.

A six-drill Rand air compressor is being put in at the Dreisam mine, Arrastraville; 1200 feet of 12-inch steel riveted pipe was recently placed. Water wheels are being set and the company's entire plant will hereafter be operated by water power.

At the Rising Sun mine, Arrastraville, the work of pumping out the old shaft had to be suspended on account of the extreme cold weather.

Work on the addition to the Jumper mill is being rushed. It is expected that by April 1st sixty stamps will be in operation.

The Golden Rule mill will start up shortly on New Era ore. Prospecting is being done at the north end of the New Era claim, adjoining the Golden Rule. The company now employs 200 men and pays on the 15th day of each month.

The gravel claims along Woods creek, above Yankee Hill, will all start up soon.

J. Schoenfeld, owner Mountain Lily near Columbia will put a 5-stamp mill on his property.

The Tuolumne County Electric Light & Power Co. has bought the Jamestown Electric Light Co.'s line and proposes to furnish light to Jamestown, Quartz and Stent, the power coming from the plant on the Stanislaus river and Phœnix lake.

S. Sprout, the new Gen. Mgr. of the App Consolidated Co., telis the Jamestown *Magnet* that Messrs. Hale and Jacobs, top and underground foremen respectively at the Rawhide, will perform the same duties at the App mine. The chlorination works at the Rawhide are in operation. F. Voorheis, the new foreman at the works, from Amador county, has taken H. Tuttle's place. He comes highly recommended. H. T. Sabin, assayer and metallurgist, is now in charge of the Rawhide assay office.

At the Santa Ysabel mine the ore body in the central ore chute has been cut a distance of 105 feet. The vein is about 8 feet in width.

The 50 H. P. dynamo at the Brown's Flat electric light plant is transferred to the Black Oak mine, where it has been installed in place of the former smaller dynamo. The new dynamo is capable of running 500 lights, and will furnish light for Soulsbyville also.

The San Giuseppe mine, at Sonora, is to be reopened Monday. It is bonded to Maynard, Lamb & Drake. The Sonora *Democrat* recalls the fact that the San Giuseppe has yielded the purest gold in its natural state ever discovered in the world. All the gold taken from the claim had an average fineness of 985, while the best reached 988⅓, worth $20.4341 per ounce, a shade better than the Mt. Morgan of Australia, and within less than 24 cents per ounce of being chemically pure. The old workings of the San Giuseppe consist of an incline shaft 225 feet deep, driven down on the vein at a pitch of 85°. At 70 feet the first level was established, the vein being drifted on 130 feet west and 20 feet east; level No. 2 is at 130 feet, drifting being done 120 feet west and 40 feet east; the third, or bottom level, is 220 feet from the surface, from which point a single drift runs east 50 feet. The vein carries an average width of 1 foot, all solid, and well sulphuretted. The mine paid well when operated by F. Sutton of Sonora. The ore was roasted in lump in a cupola furnace and afterward crushed in an arrastra. Though some were considerably lower, many runs were made on $50 ore. The property was in litigation for five years, and the last real work done on it was in '93.

Trinity.

The LaGrange Co. has sustained much damage by the bursting of pipes and it is calculated that it will be late spring before the damage can be repaired. The mine has been shut down. Hydraulic pipe all over the county suffered by the freeze and no attempt can be made to repair the damage until after the cold snap.

The Brown Bear mine at Deadwood was disabled by the bursting of pipes, compelling a discontinuance of work in portions of the mine. On Stuart's Fork the same condition of affairs prevails and a general suspension of work is the result.

Free Press: Cold weather has caused a shutdown of nearly all mining operations in this county, particularly hydraulic and placer. The freeze has not only cut off the water supply, but has inflicted damage in all directions that will require several months, in some instances, to repair. There is not much snow in the county now except on the north hillsides and on the higher mountains, where the thaw has been imperceptible and a considerable depth is still present.

COLORADO.

BOULDER COUNTY.

At Eldora a strike is reported in the cutting of the Memphis vein in the Mogul tunnel, the vein being 8 feet wide and of tellurium and sulphide of iron showing free gold. It was cut at a depth of 700 feet at a distance of 1000 feet from the mouth of the tunnel.

CHAFFEE COUNTY.

Iron is prominent in Whitehorn ores; the smelters bid 15 cents per unit for each unit of iron in excess of silica. This makes the smelter charge low. On one ore shipment to the Arkansas Valley smelter the charge was only $2.50 per ton. The total charge, including hauling and freight, on the average Whitehorn ore is under $10 per ton.

CLEAR CREEK COUNTY.

A Georgetown dispatch says this winter has been a hard one for the miners about Georgetown, the heavy snows and weather ranging below zero for weeks at a time having interfered with the transporting of ore from the mines to the mills to such an extent that in some cases the ore houses and sorting bins are full to overflowing, compelling the miners to use old drifts and crosscuts for storerooms. At the Seven-thirty mine every foot of space in the ore house is piled high with ore waiting shipment, and unless the weather breaks and allows the clearing of the wagon roads from snow, work will have to be abandoned by many of the leasers for lack of room to store and sort the ore. The Griffith mine is putting out about 200 tons of ore per month, and the leasers are all making good money. Cook & Materen have a streak of solid lead over 18 inches wide and running from one to three ounces gold per ton. Work on the recent strike on Bard Creek has been abandoned on account of the heavy snow, but there is no doubt of the richness of the find and it will be but a few weeks until the mine will be added to the regular shippers.

Idaho Springs *Gazette*: A carload of wolframite ore, 34,300 pounds, was shipped from Lead City, South Dakota, to the Newton mill at this place, this week, for treatment. The ore arrived Monday and is now being run through the stamps. The freight on the shipment amounted to $130.16.

The Great American and Jenny Lind Nos. 1 and 2 are being worked under lease and bond. The lodes cross each other at an angle and three adit levels have been run—two on the Great American and one on the Jenny Lind. The Great American vein runs southeast and northwest, the Jenny Lind runs directly north and south.

EAGLE COUNTY.

Heavy snows and difficulty of transportation caused the Hecla G. M. Co. to temporarily suspend operations at Holy Cross. Supt. Fulton has resigned.

EL PASO COUNTY.

At the International G. M. & M. Co.'s property near Victor the shaft has been sunk 500 feet. In the 200-foot level is 30 inches of $25 to $30 ore.

The electric hoist on the Last Chance, owned by the Mobile G. M. Co., is in operation.

Victor *Record*: There was no call on the Colorado Springs stock exchange yesterday, as the clearing house was again swamped with orders and needed a day to catch up.——The richest lot of ore ever sent out from the Orpha May has been marketed from the Sullivan lease at the 600-foot level. It was a 10-ton lot of high-grade sylvanite.——The Victor Con. on Battle mountain, under lease to McPartland & Co., has produced twenty-five tons of ore estimated to run $120 to the ton.

Post: Cripple Creek district's dividend showing for the first ten days of February is gratifying. In these ten days dividends have been declared as follows, payable in February: Gold King, $10,000; Associated, $11,000; Portland, $60,000; Isabella, $135,000; total, ten days, $216,000.

GILPIN COUNTY.

The heavy snows this winter are a source of much satisfaction to the gulch and placer miners, who realize that they will be able to pursue their avocation this year away into the fall months. Few people realize that considerable gold is taken out in the gulches and creeks of this county every year, with the aid of giants, sluice boxes and rockers. Such rich gulches as Russell, Nevada, Prosser, Lump and Gamble, as well as South Boulder, Beaver and North Clear creeks, will be worked this year and the cleanups of gold from that source ought to be quite large. The big hydraulic plant on South Boulder, operated in past seasons by the Pactolus Hydraulic M. Co, will be worked in bigger shape than ever this year.

Mgr. Lowe of the Topeka mine furnishes the *Register-Call* with the following returns from the shipment made last week: The second grade weighed 27,355 pounds gross, and gave values of 34.67 ounces gold, 12.22 ounces silver, showing a commercial value of $655.12 per ton, the shipment bringing almost $9000. The third class weighed 3500 pounds, its value being 5 59 ounces gold and 8.29 ounces silver, or $101.49 net per ton. Mr. Lowe has in the safe vaults in Denver eight sacks of the rich ore, weighing about 500 pounds, which is of the same grade as the lot which gave values of 2055 ounces gold per ton. This lot of rich ore will be treated at E. E. Burlingame's assay office in Denver.

Twenty-five men are employed on the Pederson mine on Bobtail hill; enough milling ore is shipped to keep fifteen stamps dropping.

The property of the Sleepy Hollow M. Co. in Black Hawk was sold by Sheriff Mitchell on the 11th to A. B. Seaman, of Denver, for $15,180.49.

GUNNISON COUNTY.

At Ohio City the Cortland G. & S. M. Co. has shipped thirty tons of ore which runs $60 in gold and silver and milled fifty tons saving $14.19 to the ton. Six tons were milled into one. The mill run determined that the ore will concentrate and the company intends to erect a concentrating plant.

A tunnel of 160 feet has been driven on the Magnet. At 125 feet the vein was cut and now drifting both ways upon it is in progress. About 60 feet of drift work has already been done. The principal vein shows on the Magnet and Messenger telluride or a hessite ore in character.

The Calumet, being operated by the Bimetallic Leasing Co., is shipping ore stoped from a winze in the upper tunnel. The last car shipped netted over $700.

The Ashland M. Co. is driving the Carter tunnel on Ohio creek above Ohio City. The tunnel will be driven in several hundred feet and will cut the formation at great depth.

Regarding the statement that the Lead King mine has been sold to an English Co. for $100,000 and that $5000 had been paid down, the *Silver Lance* says facts in the case are these: An English Co. has paid Burnett, Smith & Tays, the owners of the Lead King, a sum for an option on the mine until the 1st of September. The examination and report of the mine has not yet been made. The proposed purchase includes a group of claims as well as the Lead King.

On the Bear Mountain tunnel Dempke & Tichauser have big power drills driving ahead. This tunnel is now in over 400 feet, and at about 1000 feet the ore body of the Illinois mine is expected to be entered.

The Burt, on Mineral Point, which created a sensation last fall by opening up into the largest deposit of lead-copper ore ever found in that section, is working a crew of men under a $15,000 bond and lease, to be taken up next May. The mine will then pass into the control of the Indiana M. Co., present owners of the Belle of Titusville. The same company owns a concentrating plant at the base of the mountain and will enlarge it next spring and build a tramway to the Burt, a distance of 1800 feet.

The Lead King owners have given an option on that mine, as well as the entire group, of which it is a member, until the first of September; $5000 cash was paid for this option, representing a $100,000 deal.

LAKE COUNTY.

A Leadville dispatch says 100 men, armed with picks and shovels, started out on the 10th to clear the snow and ice from the Denver, & Rio Grande tracks below that city, that coal may be brought in to enable the smelters and mines to continue work, or at least to keep the pumps in operation. The Leadville Pumping Association, which is unwatering the down-town mines that have been flooded since the big strike, had then only enough coal to last twenty-four hours. The stoppage of the pumps just on the eve of completing the important work, which has been in progress for the past six months, would be a serious blow to the Leadville mining interests, so the mine and smelter managers decided to aid the railways in opening up their lines and the shovelers sent up by them will receive the same wages as when working in the mines and smelters. Business men also went along as volunteers to shovel snow.

At Leadville last week the Jonny mine manager offered the ore haulers a three months' contract to haul all the ore from that mine if they would step in and help them out, as, owing to the big snow blockade, the railroads could do nothing. The haulers held a meeting and concluded not to accept unless a year's contract was granted them.

Leadville *Chronicle*: In the Louisville and Colorado No. 2 mines on Iron hill, under the management of A. F. Wuensch, the output has been increased to about 1000 tons of silver-lead-bearing sulphides, in addition to the product of iron sulphides. In opening up the mines during the past few months a new shoot of lead ore has been opened that averages $5 per ton in gold, in addition to good silver and lead values.——At the Gambetta on Fryer hill from the bottom of the shaft, which was sunk to the ore plane last fall, at a depth of 233 feet drifts were run in two directions. From one of them a few tons of first-class lead ore is being mined and hoisted to the surface, while the ore streak is being followed up. There is 1 foot solid of it which runs 50% lead and from eight to ten ounces of silver.

PARK COUNTY.

Ore shipments to the Denver smelters have been temporarily suspended at Alma because of the big snow storm. The storage of snow in the mountains is greater than at any time; the lode miner is disgusted; for his brother, the placer man, the coming summer promises to be a golden harvest of rare extent. Yet the lode mining is not in the background, in prospective importance, for it is claimed that much increased work will be in store for these districts when spring opens up, and that present operative mines will increase their working forces.

SAN MIGUEL COUNTY.

The Telluride *Journal* reports that one morning last week in the breast of the Ophir tunnel, 3000 feet underground, two men were running a machine drill. They had put down seven holes and had just started to load, having put three sticks of giant powder into the first hole, which was being tamped, when the powder exploded. The body of one was blown 20 feet. He was killed instantly. His partner was also blown some distance and peppered with the flying rock the whole length of his body on one side. A part of one hand was blown off and it is thought one eye is destroyed. After the explosion he walked 400 feet down the tunnel, where he found a "godevil," a car used for carrying timber and supplies to the tunnel breast. Lying on this he managed to push himself some distance farther to a cross vein, where other men were at work, whose attention he attracted. The theory is advanced that the tamping bar is responsible. A steel tamping bar is used with a wooden plug in the face, to guard against the steel striking fire against the rocks. The sticks of powder are split before being put into the holes, and it is supposed that some of the high explosive, which is about the color and consistency of butter in summer, when used, stuck on the side of the hole when being pushed down, and that in tamping the bar struck a spark of fire, setting off the whole mass.

Telluride *Examiner*: The Cimarron mill is pounding steadily, although the newness is not yet worn off entirely, and hardly the full capacity is reached this week.——The snows of the present week are piling high on the mountains and the wind is doing its share in driving it deep into the gulches and ravines, where it will slowly melt during the summer months and furnish an abundant supply for mining purposes.——According to the reports of mine managers the rustling of ore has reached alarming proportions, and some concerted effort will be made to put a stop to the thefts. Many of the mines which frequently strike streaks and pockets of rich gold ore are heavy losers from the fact that much of it is stolen and carried away by the men who work in the drifts, aided by outside parties, who dispose of the stolen mineral, and there is no doubt that such mines as the Tomboy, Smuggler-Union, Silver Pick, Silver Bell and others lose thousands of dollars annually through the dishonesty of the men employed. These losses are of serious consequence to many mines which ordinarily are working veins of a value that pays but little above operating expenses, and to such an extent has this stealing grown that it is of necessity that some active plan be found to stop it.—— The successful starting and operation of the Liberty Bell mill adds a valuable producer to San Miguel's list for the coming season. The mill has ten stamps dropping and about thirty tons of ore is put through every twenty-four hours. In a few days ten more stamps, already completed, will be started and an additional twenty stamps are being put in. This will give the mill forty stamps and a capacity of at least 100 tons a day.

GEORGIA.

J. E. Black of New York and J. H. McCoy of Denver have decided positively to build a smelter in Atlanta, provided the railroads will agree to institute such freight rates on gold ore as will enable the managers of the properties to ship their output to Atlanta.

IDAHO.

The improvement in the showing on the Lombardy still continues, but ore 12 inches wide is "fat" enough that it would only concentrate about two to one—a grade of ore, which, if it shows well in silver, would almost pay to ship at the present price of lead.

At Warren little interest is taken in the Buffalo Hump country, but the miners are all interested in the river camp, or Mallick district, as it is now called. It is believed by many there that the Morning Star group in the river country will prove to be a bigger proposition than even the Big Buffalo. Warren is the outfitting point for the Mallick country, which is eighteen miles from there.

The Cornucopia, owned by E. Brooks, continues to be the big mine of the camp. At the depth of 250 feet the claim continues to have a 3-foot ledge, the ore carrying free gold.

W. H. Butters & Bros. of Spokane, have bought the Red River Meadows and are having the Bucyrus Co. of South Milwaukee, Wisconsin, build a chain bucket elevator dredge. The first shipment of 70,000 pounds is at Lewiston.

Wallace *Press*: The sand carbonate belt northeast of Murray is receiving attention, the price of lead being at a point where any kind of lead property has some value, while anything like the ores of this district means a decent fortune.

Tribune: James Healey, one of Capt. DeLamar's staff of bonanza chasers, verifies the report that the initial payment of $25,000 has been made on the deal involving the transfer of the Big Buffalo group, at Buffalo Hump, and expresses the opinion that Clark & Sweeny will experience no trouble in discharging the remainder of the payments that in the aggregate amount to $575,000. This is the group for which H. A. Cohen, former Mgr. for Capt. DeLamar, made an offer of $500,000 after Mr. Healey had completed his examination. The owners, however, held out for $575,000, and this the gentleman declined to respond to. The purchasing party is now in possession and will begin the erection of a mill early in the spring.

Mullan *Mirror*: A new compressor plant is to be put in at the Old Abe at Wardner.—— The value of the ore output of the Cœur d'Alenes is estimated at $45,000 per day.—— The Hecla, at Burke, in crosscutting, struck another vein of copper and galena 4 feet wide. ——In Wallace has been formed the Leslie M. Co.; their property consists of nine gold and copper claims just over the line on the Montana side; Gen. Mgr., Wesley Everett.—— One-half the gold from Potosi gulch is pure quartz gold, which became separated from the quartz by decomposition and oxidization very close to its source.

KANSAS.

A Galena dispatch of the 15th says: "All records were broken to-day when zinc ore sold at $47 to $50 a ton in Galena, Joplin and Webb City. The Scott M. & S. Co. was to-day offered $50 a ton for its entire output for the next ninety days. The offer was not accepted. Six months ago prices ruled from $20 to $24."

MONTANA.

At Basin, C. H. Dickie of Baltimore has an option on the Hope mine; price, $500,000. He has forty-five days in which to make the first payment of $100,000, providing everything proves satisfactory to him at the end of that time; further payments: $250,000 at the end of sixty days, $150,000 in ninety days. The 600-foot level has been reached in the shaft; a 15-foot sump will be sunk, after which a station will be cut and a crosscut driven to the lead. Ore was found to exist on the 500-foot level, and the company expects to find its continuation on the 600.

The Cable gold mines, west of Anaconda, may soon be started up again after an idleness of ten years. The principal owner is J. C. Savery. The Georgetown-Cable mining district has considerable low-grade and base ore.

At Virginia City, C. A. Damours leased the Kearsarge, at the head of Alder gulch. In '66 this mine produced nearly $500,000. Mr

Damours will unwater it and further develop the property.

The Chicago M. & D. Co. have moved their dredge—the Maggie A. Gibson—from Bannack to the mouth of Alder gulch. The Conrey Placer M. Co. will substitute for the steam shovels one of the dredges used at Bannack with such success.

In Park county, the Bear Gulch M. Co. has been employing fifty men all winter, operating its 20-stamp mill and will increase the number of stamps to sixty before the spring opens. It ships its concentrates to the East Helena smelter.

At Pony, Elling & Morris, owners of the Clipper, the coming spring will build a 40-stamp concentrating mill, to be erected near the mine and furnished with power from an electric plant on Willow creek completed last fall, and which has furnished power for the drill plant and lights the little camp, which is growing day by day with the development of the mines surrounding it. The new mill will treat the low-grade ores, the highest grade being shipped to East Helena. The old mill, which has done duty many years, will do custom work in the future.

The Garnet owners, who have a large low-grade property, have men blocking out ore for treatment next season. Their mill is run by water power and they are unable to treat their ores during the winter season. During the warm months they treat about sixty tons daily. The mill was built about two years ago and is owned by St. Louis men. One of the heaviest stockholders in the concern was a man who knows nothing about mining, but had made a fortune out of an invention of its own—a brick and bone crushing machine. He insisted that his bone crusher, which operated on the principle of a thrashing machine, with a series of small hammers on a revolving cylinder in place of teeth, would crush the Garnet ore, and as he had much money in the venture and was one of the directors, the manager was forced to give him a trial, well knowing what the result would be. The mill was built with the idea of replacing the bone crusher with stamps if a trial demonstrated its impracticability. When the mill was completed the directors came out from St. Louis to see the start. The ore was fed in and the bone crusher lasted about fifteen minutes. Later a set of stamps were installed with satisfactory results.

At Neihart, in the Galt mine, men are working on a body of manganese ore 7 to 12 feet in width. Sixty feet farther up the raise is a streak of ore which assays 300 ounces silver per ton, besides considerable lead.

The Anaconda Co., at Belt, is washing nut coal by the hydraulic process: about 1400 tons per day.

The semi-annual statement of the New Elkborn M. Co., Ltd., shows that £87,500 of the £300,000 capital stock has been paid in money, the balance being issued in purchase of the company's properties. The estimated value of the property in Montana is £15,583; that in Colorado, £268,699; cash in bank, £7642; ore in transit, £5617; total assets, £297,541. The liabilities are aggregated at £4255.

NEVADA.

The Boston & De Lamar group of mines recently incorporated and placed on the market in Salt Lake City consists of four claims adjoining the April Fool, Lincoln county, fifty-two acres in Ferguson mining district.

The Slip M. Co., at Olinghouse canyon, Washoe county, has finished crushing 100 tons high-grade ore.

Near Winnemucca T. J. Howard at the Pueblo mining district has eight claims carrying gold and copper.

The Pueblo M. Co. have ten men getting out about ten tons a day of $300 rock.

The Utah & Pacific Railroad from Milford, Utah, westward is being built.

S. P. McKnight in Esmeralda county is experimenting with Candelaria tailings.

The installation of the pressure column for operating the Risdon hydraulic plant at the Comstock is about completed; draining the flooded levels will shortly begin.

At Osceola, White Pine county, the Exchange, Crescent and Golden Eagle are sold to Salt Lake men who will take the 20-stamp mill down and set it up again ready to run in forty days. W. F. Patrick is to be Supt.

A deposit of antimony is reported discovered nine miles from Wellington. Mr. Packard of Gardnerville is one of the owners

The Wells *Herald*, speaking of the completed Golconda railroad to the mines of the Glasgow Co., says: It is predicted that during the present year the same company will construct a railroad from Wells to Cherry Creek. The managers say that the company has an immense body of ore in their mines at Cherry, so large that all the teams in Elko county will not be able to keep the chutes empty during the present year.

The *Times-Review* advises miners to keep away from Tuscarora. There are many idle men there now.

Virginia *Chronicle*: The Harris, Blood & Co.'s tailings plant in Six-Mile canyon has been sold by the sheriff and bid in for $6005 by the Bank of California for the Tahoe Lumber & Flume Co. The property sold included the entire equipment of the so-called electro per-oxygen process with the exception of the assay department. The sale of this part was posponded until Feb. 23rd, Messrs. Harris and Blood having notified Sheriff Quirk that the assay office and its equipment was not included in the tailings plant but was individual property. The assay office is considered the most valuable part of the plant and it is the intention of the mortgagees and lien holders to have the question settled in court as to whether the claim that it is not included in Harris-Blood plant is well founded.

NEW MEXICO.

At Cerillos is locally reported newly discovered silver leads of unusually high assays and fine smelting properties. This, if so, would aid in starting the proposed new smelter there and cut off the shipments to El Paso.

Silver City reports nearly 200 leasers at work on the Santa Rita copper properties. In the Montoya mine an extensive vein bearing copper was found, from which a shipment sent to the Silver Reduction plant yielded 80% of values. Thirty men are employed on the Cortez copper mine at Santa Rita. A body of rich copper ore has been found in the old Spanish workings of the Carrasco mine.

A. L. Shaw of California has bonded the St. Helena mine at Central for ninety days: consideration, $25,000.

The Old Abe Co. in Lincoln county has begun excavating for the 45,000-pound hoist. The cyanide plant is nearly completed.

OREGON.

The North Pole at Bourne, owned by Baring Bros., London, is one of the biggest producers in the Sumpter district, although the amount of their output is never made public. A 6-foot vein of $200 to $300 ore is reported to have been struck recently, which is being shipped direct to the smelter. Their ledge is from 20 to 60 feet wide.

The Columbia saves about 25% on the plates, shipping the remainder in the form of concentrates. They are piling up ore awaiting the result of the new bromine-chlorine process at the Golconda before putting up a larger plant.

The Red Boy mine, thirty miles west of Baker City, last month had a $50,000 output.

The new $100,000 mill at the Golconda mine, near Baker City, is building. The owners expect great success with the new bromine-chlorine process. They are J. G. and J. T. English of Dansville, Illinois. The mill building covers 170 by 300 feet. The complete equipment will be in operating shape April 1.

At Portland is being framed a gold mining dredge to cost $40,000, for the Pomeroy Dredging Co. of Portland. The dredge when framed will be shipped knocked down to Weatherby station on the O. R. & N., and when put together will be launched on Burnt river, which will be dammed at that point to make a pond big enough to float the dredge, which is 100 feet long and 34 feet wide. Steel buckets run on rollers to scrape up the gravel from the bottom and dump it into sluice boxes on board. It is expected to be ready to run by May 1.

SOUTH DAKOTA.

The Homestake Co. is now dropping 540 stamps, this number to be increased with better water supply. Surveyors have run new water lines from Cold springs and Spearfish creek. The latter will probably be brought into the Homestake plant at an estimated cost of $1,000,000. This will necessitate about twenty-one miles of ditching. The company is now operating 400 stamps of their own and is running the Highland mill of 140 stamps under lease. The Highland Co. in turn is operating the Deadwood & Terry mine and a 160-stamp mill.

The General Ellison will be sunk to 1100 feet.

UTAH.

The Blue Mountain country, on the Colorado-Utah border line, is attracting attention. The locations of the mines are twenty-two miles east and a little south from Vernal and extend east to the Colorado line. About fifty locations have been made. The vein is reported as being a contact vein, with a good showing on top of the ground. The assays run from $3 to $2200 per ton, the average, however, being about $50 per ton.

The Golden Wonder lode, with about twenty-five locations, lies about 600 feet south and parallel with the lode which is causing the present stir, and is 40 feet between walls. This property has been located for about a year. Development work has been done by an association of business men from Vernal, having one shaft on the vein a depth of 35 feet, with assays running from $5 to $48 per ton, being a cyaniding proposition, so pronounced by all who have examined the ore. There is plenty of timber, wood and water, and everything on and near the ground that goes to make up a good mining camp, some of the locations being as near as five or six miles from Green river.

The *Herald* reports the reorganization of the Daly-West M. Co. as an accomplished fact. The Haggin, Chambers and Tebbs interests are deeded to the company for $1,500,000, articles of incorporation of the Daly-West Co. to be filed this week. The mine, which has been idle for years, owing principally to disputes between the owners, will be reopened about March 1 and will from the start furnish employment to 100 or 200 men. The Daly-West has plenty of high-grade ore and from the day it is opened will be a producer.

Tribune: The Horn Silver of Frisco, with its record of dividends amounting to $5,210,000, is to be added to Utah's list of copper propositions, and in a few days will begin the marketing, in lots distinct and separate from that in which lead and silver predominate, ores carrying as much as 25% copper per ton.

WASHINGTON.

D. Sutherland of Silverton was recently granted a patent by the Government to a 20-acre placer claim, embracing the town of Silverton.

A strike in Republic camp is reported in the Dora. Supt. Blackburn says: "We have cut through 3 feet of this ore already, and have not as yet struck the foot wall. From this 3 feet of ore we have taken samples for an average assay, the result being $143.66 in gold and $1.90 in silver."

WYOMING.

The Colorado Fuel & Iron Co. of Pueblo has leased seventy-five claims in the Hartville district of Laramie county.

FOREIGN.

BRITISH COLUMBIA.

The new War Eagle hoist is the largest in the Pacific Northwest, and one of the largest in the world. It is 175 feet high and has a capacity of lifting 1000 tons of ore a day. With this hoist it will be possible to work the mine to a depth of 6000 feet. It is the intention to continue the deep workings of the War Eagle.

The final payment upon the Le Roi stock was made by the British American Corporation January 31st in New York. This final payment is $3 12½ per share. The following are the amounts which will be received by the shareholders, all of whom are residents of Spokane, Wash.:

	Shares	Amount
W. W. D. Turner	40,000	$125,000
W. J. Harris	38,400	120,000
W. M. Redpath	36,960	115,500
George Turner	32,000	100,000
Mrs. W. W. D. Turner	15,000	46,875
E. D. Saunders	15,000	46,875
Frank Graves	14,000	43,750

Although this is the final payment of the purchase price of the mine, it is not the last money that the shareholders will receive from the British American Corporation. In addition to the purchase price of $7.25 a share, the Turner interests are to receive the proceeds of the matte and ore in the smelter at the time the deal was closed. This will amount to $1 per share additional, making the stock net the sellers about $8.25 a share.

The St. Eugene mine near Moyie City, B. C., has been bonded by Matheson & Co. of London, England, for $400,000. The preliminary papers for the deal have been signed by the owners of the mine and the Vancouver representatives of the London company. The final papers will be signed and a payment of $40,000 made as soon as word can be received from England.

C. H. Parson of Golden has secured a lease from the Provincial Government for dredging Bull river and White Horse creek for placer gold.

The Stemwinder tunnel is in ore which is a conundrum: lead, silver, copper and gold lying in close proximity. They are also in the North Star and Sullivan groups.

MEXICO.

Nine miles from Nacosari, Sonora, the Gregg-Normire copper property, consisting of ninety-four pertinances, is reported sold to J. A. Cruse, representing the Sonora Improvement & Investment Co.; price, $45,000 in gold coin.

THE KLONDIKE.

Klondike miners are to have relief from the methods which have prevailed at Gold Commissioner Fawcett's office in the recording of claims. The records of the office were thrown open to the public on January 1st. There will be no further entrance of favored applicants for claims through the back door of the office. The new commissioner, Mr. Senkler, has changed all that. Immediately that he took Gold Commissioner Fawcett's place he announced that the books of the office would be free to all who wanted to see them. The people of Dawson expect now that there will be a much more honest and competent administration of public affairs, for the claim of every miner will be protected and every new district will be open to persons who choose to investigate. The only complaint against the Canadian Government now is the 10% royalty.

Treasurer Botsford's report of the Joseph Ladue G. M. & D. Co. of Yukon to Jan. 1, '99, shows earnings at Dawson, etc., $186,284; earnings on transportation, $54,224; total, $240,508; accounts and bills payable, $22,565; taxes, insurance and general expenses, $56,514; total expenses, $79,079, leaving net profit to date $161,409. This, however, was on sawmill, transportation, sales, etc.

The miners are leaving Atlin for Dawson, consequent upon the passage of the alien exclusion measure. The trail is in good condition. The ice on Taku Arm is 24 inches thick. Further discoveries have been made on Caribou creek, south from McKee creek.

Consul McCook writes to the Department of State from Dawson City that platinum has been recently discovered in black sand in some of the creeks there. A furnace test is said to have resulted in showing that in one ton of the non-metallic black sand there was $102 in gold and 96 ounces of platinum, some iridium and a trace of tin.

Personal.

ARTHUR WINSLOW, Gen. Mgr. of the United States & British Columbia M. Co., is in Telluride, Colo.

L. E. AUBURY has returned to Los Angeles from northern Arizona.

SAM'L NEWHOUSE has returned to Salt Lake, Utah, from New York.

J. J. CRAWFORD has returned to San Francisco from El Dorado Co., Cal.

ANDREW JOHNSON is the new Supt. of the Conger mine, Bingham, Utah.

GEO. W. DUNBAR supersedes E. C. Billings as Supt. of the Edison, N. M., G. M. Co.

T. E. SCHWARTZ succeeds S. S. Robinson as Mgr. Iron Silver M. Co., Leadville, Colo.

GRANT MOORE succeeds J. F. Fitzgerald as Supt. the Confidence mine, Quartz, Colo.

A. H. GUNNELL has been appointed assayer at the Baisley-Elkhorn mine, Baker City, Or.

D. L. BLISS JR. is to be Supt. of the railroad to be built between Truckee and Tahoe, Cal.

H. A. SHIPMAN has resumed his old time position as Mgr. Cornucopia mine, Cornucopia, Or.

W. G. STAGMAN has resigned the superintendency of the Alameda mine, Tuolumne Co., Cal.

E. A. STENT of Mokelumne Co. goes this week to Sonora, Mexico, to examine a mining property.

J. STANLEY MUIR of Denver has gone to Port Limon, Costa Rica, to inspect some mining properties there.

W. H. RADFORD of San Francisco, with surveyors and chainman, has gone to the Colorado river with A. J. Otis of the Santa Ana M. Co., on an extensive prospecting expedition.

G. L. WHITTAKER, Supt. Baisley-Elkhorn mine, Baker City, Or., has returned from Norwich, Connecticut.

J. S. CRAMPTON left Prescott on the 9th for Terra Patea, Peru, where he will be millman for the Inca M. Co.

C. LAUBSCHER, director general Santa Rosalia M. Co., Lower California, is making his annual visit of inspection to that property.

W. R. SPALDING, for seven years Gen. Mgr. Truckee, Cal., Lumber Co., has resigned and will go into business in San Francisco.

ARTHUR TUTTLE has resigned the superintendency of the German Bar and Conrey placer mining companies at Virginia City, Mont.

GEO. TALFORD of the Risdon Iron Works is at Lowden's, Trinity Co., Cal., to inspect the dredge and the new driving wheel made by the company.

WM. WATSON, late Supt. Golden Reward mill at Deadwood, S. D., has been engaged for like position at the Economic G. E. Co.'s mill, Victor, Cal.

HUGH MCDONNELL is in London, where, it is reported, he has just sold a large Mexican mining property. He expects to return to California next May.

DR. W. D. EASTLAKE, en route from New York to Japan, says an American syndicate has been formed to expend millions in providing modern electric street railroads for Japan's large cities.

S. R. H. ROBINSON at Phœnix, Arizona, has sued the Minnesota & Arizona Construction Co. to recover $20,500 salary for services as Gen. Mgr. and Supt. of construction between April 1st, '95, and Sept 5th, '98.

THOS. J. BARBOUR of the Risdon Iron Works of San Francisco went to the Comstock, Virginia City, Nevada, yesterday to be present when the unwatering apparatus begins operations in the C. & C. shaft.

MAJOR W. H. HEUER and the other members of the U. S. Debris Commission have returned from an official visit to Nevada and Yolo counties, Cal., to determine the extent and character of the proposed Government work.

J. D. BENEDICT of Santa Fe, Supt. forest reserves in New Mexico and Arizona, and F. S. Breen, supervisor of the San Francisco reserve in the northern part of the latter Territory, are gathering material for a report to the Interior Department.

"JIM" WARDNER is in Seattle, Wash., from Washington, D. C., where he has been lobbying in the interests of a railroad franchise for a short line from the mouth of the Fish river to the Omilak mines. He says "the first boat to St. Michael in the spring will take a party of surveyors and mining experts, representing Eastern capitalists, who are to build the road." (This mine is the farthest north of any metal mine in the world and is owned by T. C. Green of San Francisco.

CHARLES L. DORSON, a civil engineer who has just returned from Colon, says the French are concentrating their energies on the Culebra cut, the most serious obstacle along the whole route of the Panama canal. The company has from 1700 to 2000 laborers at work with about fifty locomotives, each of which hauls a train of from twelve to fifteen cars. Up to the present about $137,000,000 in American gold has been spent, and he believes the canal could be finished for about $126,000,000. The concession given by Colombia expired last October.

J. SLOAT FASSETT, prominent in N. Y. State politics, is in San Francisco arranging for men and machinery to work his extensive mining properties in Corea, where he has Government concessions aggregating in area nearly 100 square miles. Another American, L. S. J. Hunt, has large Government concessions there. Messrs. Schulz and Gunker, who have been at work for the latter, have returned from the hermit nation, where they had been employed by Mr. Hunt in building a stamp mill. They say he has good mining property. Prospects and assays show considerable ore going $40 to the ton. They say the best native miners, who can do as much work as an American can, cost only 10 cents per day. They think American laborers should not think of going to Corea. They could not compete with the natives. But there is a good chance for American mechanics.

F. M. SMITH, "the borax king" has returned to California. He says the fact of the consolidation of the borax interests has been accomplished substantially as stated by the dispatches published at the time. The Alameda refinery will run as before. It will not affect the California output. The Alameda refinery may be enlarged should the demand for borax require it and the demand is constantly increasing. The borax combine comprises nearly all the borax producing concerns of the world. Two are located in London, the Borax Co., Ltd., operating deposits in Asia Minor, and the Pacific Borax & Redwoods Chemical Co., Ltd., operating California deposits. There are also the Lyons (France), Co., the Empresa de Ascotan, the Carcote, the Chilicolpa, the Cosapella and the Pintades in Chile; the Ubinas and the Arequipa, Peru; the San Bernardino Co. in southern California, and the firm of Mear & Green, Staffordshire, England. The new company is to have a capital of $7,000,000 in ordinary shares, $4,000,000 in preference shares and $4,000,000 in debentures.

Obituary.

PETER NEU of the firm of Heldmaier & Neu, the San Pedro, Cal., breakwater contractors, was accidentally killed last Saturday by being thrown from the top of a coach.

Industrial Notes.

—Saloons at Dawson pay a license of $50 per week.

—The Crescent Oil Co. is boring for oil south of Oil City, near Selma, Fresno Co., Cal.

—J. H. Boyd of San Bernardino, Cal., will build an electric road from that city to Redlands.

—Traffic is so heavy on the Central Pacific that three extra dispatchers have been put on at Carlin, Nev.

—The Southern Pacific Co. pays taxes on its lines in California at the assessed value of $17,408.53 per mile.

—Last Tuesday Grass Valley, Cal., sold $40,000 7% sewerage bonds at a premium of $6560 to a Cleveland, O., firm.

—The Government, in remitting $20,000,000 indemnity to Spain for the Philippine islands, will ship the gold direct from the treasury.

—The White Pass Railway Co. has abandoned the Fantail trail from Log Cabin to Atlin City, Alaska, and will use the Too-Chi trail instead.

—The four generators at the Electric Power Works on the South Yuba are connected and can now be operated by either the Yuba river or Rock creek water systems.

—At Globe, Ariz., on the 16th, with appropriate ceremony, was driven the golden spike on the new line of railway from Bowie to Globe—the Globe, Gila Valley & Northern railway.

—The Yuba, Cal., Electric Power Co. has consolidated with others; principal place of business, San Francisco; the term is fifty years; capital stock, $1,000,000, of which $50,000 is subscribed.

—In Denver, Colo., a mortgage for $20,000,000, given to the Central Trust Co. of New York City by the Colorado & Southern Railway Co., was filed this week. The revenue stamps used aggregated $35,250.

—The gross earnings of the Union Pacific for six months ending Dec. 31st were $10,604,089, showing an increase of $591,084; operating expenses, $5,696,333, a decrease of $579,372; net earnings, $4,907,755, an increase of $1,118,457.

—On the 3rd inst. the last rail was laid in the northeastern extension of the Pecos Valley railroad, giving it direct connection with Amarillo Junction of the Colorado & Southern, Denver & Fort Worth, the Pecos Valley and the Santa Fe.

—The Oakland, Cal., Gaslight & Heat Co. is putting in force a new rate on incandescent electric lighting. A schedule has been arranged with a view to making illumination by electricity the equivalent to gas at the rate of $1 per 1000 feet.

—Engineers are surveying a line for a railroad from Green River crossing, Utah, to the gilsonite fields in northeastern Utah, to be built by the Rio Grande Western. These deposits are very large and there is growing demand for the product.

—S. D. Prather of Montague has filed a claim on 4000 inches of water from Shasta river, near Yreka, Cal. A dam 10 feet high is proposed, the water to be conducted in a canal three-eighths of a mile and then pumped to an elevation of 275 feet through 20-inch pipe.

—H. E. Huntington is on his way from New York to San Francisco with instructions from C. P. Huntington to expedite the work of filling in the gap on the coast division between Surf and Elwood, Cal., a distance of fifty miles. The estimated cost of this new piece of road is about $2,000,000.

—The financial statement of the Southern Pacific Co. just issued shows its earnings for December, '98, when the gross receipts were $5,236,805. The net receipts amounted to $1,840,897. For the last six months of '98 the gross earnings amounted to $38,735,881; total net receipts, $11,874,773.

—A British Columbia paper says: "Eighteen hundred Chinese laborers will shortly pass over the C. P. R. R. en route to Mexico. The men engage to work on railway construction for three years, for which they are to be paid $30 per month, with a deduction of $5 per month until their passage money has been paid."

—Two syndicates control all salmon traps in American waters. The Columbia River Packers' Association, representing 75% of the pack on the lower Columbia river, has been organized with a capital of $2,000,000, and a company with similar capital has secured control of every fish trap of known capabilities from Anacortes, Wash., to the Canadian boundary.

—It is currently stated that the American Steel & Wire Co. has contracted to fence a large part of Australia and South Africa with barbed wire. It has a single contract for 1000 miles of barbed wire from Australia, and is now negotiating a contract for wire for railroads in South Africa, which, when completed, will be the largest single order for wire ever known.

—From Chicago Pres. Lambert of the American Steel & Iron Works Co. announces an advance in the wages of the employes of his company, effective March 1st: Advance to all employes earning up to $1.50 a day, 10%; $1.55 to $2 a day, 7½, and $2.05 to $2.50 a day, 5%. Altogether about 36,000 employes of the company will be benefited by the raise. The advance in wages, Pres. Lambert says, will mean an annual amount between $700,000 and $1,000,000.

—For the month of December, '98, the gross earnings of the Oregon Short Line amounted to $655,509.37, an increase of $124,427.49 over December, '97. For the six months ending Dec. 31st, '98, the gross earnings were $3,972,248.27, an increase of $708,689 54 over the same period in '97. The gross for December is the highest for five years. The comparison is as follows: '94, $392,823.43; '95, $471,077.29; '96, $473,581.09; '97, $531,081.88; '98, $655,509.37, the last being almost double that of '94.

—In the California Legislature this week the Ways and Means Committee considered the bill appropriating $500,000 for the exposition to be held in San Francisco in '91, and decided, in executive session, to recommend the passage of the bill, with an amendment making it payable out of the funds of two different fiscal years. The manner of its division was left to a sub-committee, who will wait upon the State Controller and find out how much of the appropriation could be judiciously appropriated at the present time.

—E. D. Boyle will introduce in the Nevada Legislature a bill granting permission to a corporation to tap Lake Tahoe to secure power to furnish Carson, Reno, Virginia City and Gold Hill with electric power and light. The idea is to run a four-mile tunnel on the eastern slope of the Sierras, tapping the lake 6 feet below its present level, the mouth of the tunnel to be about 1700 feet above the proposed power plant. The projector figures that enough water would flow from the face of the tunnel to furnish power for the running of air compressors, machine drills and electric motors for hauling cars through the tunnel.

—A curious industry is the conversion of whalebone from its original form into the various products, useful and artistic. Most of the crude whalebone is landed at San Francisco and shipped eastward to be distributed at the various centers. Before leaving the Pacific coast the bone is split, sorted according to color and tied into bundles. After splitting the pieces are called stalks or slabs. These are from 3 to 12 feet in length and weigh from five to twenty-five pounds each. When received by the manufacturer each slab is fringed with strong, glossy black hair, which possesses a market value of its own for brushes. After this is removed the slabs are treated to a steam bath and then are ready to be split into shell or grain bone, and finally cut into stays, whipstocks, aigrettes, etc.

—"What the drought of the last few years has cost New South Wales has been estimated, and the estimate makes up a bit of very doleful arithmetic," says the *Gazette*. "The flocks of the colony have shrunk from 66,000,000 to 46,000,000, representing a loss of 20,000,000 sheep. If to this is added the loss of natural increase, the shrinkage amounts to 50,000,000 sheep; enough, that is, to equip a considerable sized colony. In addition, there has been a loss of nearly 300,000 horses and 150,000 cattle. That the colony has been able to survive these terrific losses is a striking proof of energy and resource. Translated into money, the colony has suffered a loss, due to mere inadequate rainfall, of from £12,000,000 to £20,000,000. For so much, when expressed in pounds, shillings and pence, do a few inches more or less of rainfall count! We are probably entering on a cycle of years, a contemporary thinks, when the kindly skies will pour on the far-stretching plains their benediction of rain, and these vast losses will be quickly made up."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING FEBRUARY 7, 1899.

619,111.—CAN OPENER—W. N. Anderson, San Rafael, Cal.
618,832.—FRUIT EVAPORATOR—A. Berger, Cheney, Wash.
619,136.—PROPELLER—W. J. Carver, Tacoma, Wash.
619,140.—SEAL LOCK—A. W. Collin, S. F.
619,147.—ROCK DRILL—W. A. Doble, S. F.
619,148.—WATER WHEEL—W. A. Doble, S. F.
619,149.—WATER WHEEL—W. A. Doble, S. F.
619,046.—GAS APPARATUS—L. E. Lee, S. F.
618,893.—SCOOP AND SCALE—J. W. Miller, Los Angeles, Cal.
618,949.—SIGN—W. E. Page, Los Angeles, Cal.
619,052.—ADVERTISING DEVICE—C. S. Stafford, S. F.
619,106.—CAN HEADING MACHINE—M. A. Wheaton, S. F.
619,005.—CURRENT WHEEL—J. P. Whidden, Loomis, Wash.
619,243.—TRUNK STRAP—H. D. Wiard, North Temescal, Cal.
619,061.—FRUIT PICKERS' BAG—J. Wilson, Duarte, Cal.
618,970.—BOXING GLOVE—W. G. Wood, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Recent Mining Incorporations.

Buena Ventura G. M. Co., granted a charter by the State of Michigan; capital stock, $50,000, fully paid. E. C. Humphrey, San Diego, Cal.; A. R. Thayer and A. E. Plumer, Saginaw, Mich.

International Bureau of Mines, incorporated under the laws of West Virginia; capital stock, $50,000; $1000 paid. C. H. Sheares, G. Hipkiss, W. Robinson, B. F. Colby.

Shakespeare M. Co., San Francisco; capital stock, $6000; subscribed, $25; A. P. Ford, F. P. Howard, A. Waterman, G. Edwards, A. E. Brooke.

St. Lawrence M. & M. Co., Hanford; capital stock, $175,000; subscribed, $150,000; D. R. Cameron, P. McRae, J. W. Barbour, I. W. Foster, J. S. Robertson, J. H. Dopkins, R. E. Dixon.

Mooney Con. M. Co., San Francisco; capital stock, $30,000; subscribed, $15,000; P. B. Cornwall, H. A. Parrish, J. A. K. Lennox, A. W. Cornwall.

Dutch Flat Blue Lead M. Co., Dutch Flat, Placer county; capital stock, $100,000—all subscribed; A. J. Bruner, M. J. Curtis, G. K. Rider, W. Lampert, D. W. Carmichael, G. S. Brand.

Mountain Spring M. Co., to operate in Tuolumne county; capital stock $100,000, subscribed $80,000; H. L. Eastman, E. J. Ensign, J. H. Duncan, W. W. De Lano.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ACETYLENE GAS GENERATOR APPARATUS.—Louis E. Lee, San Francisco, Cal. No. 619,046. Dated Feb. 7, 1899. This invention relates to an apparatus which is especially designed for the manufacturing of acetylene gas, and it consists essentially in a novel arrangement of the carbide-containing chamber with means for distributing water to all parts of the carbide contained therein, means for conducting the gas to a gasometer, means for cooling the gas before it is delivered into the gasometer, and automatic mechanism connected with the gasometer and controlled by its movements whereby the supply of water to the carbide chamber is controlled, and by which it is cut off either when the gasometer is full or when the carbide is exhausted and the gasometer sinks to the bottom of the tank.

ADVERTISING DEVICE.—Chas. E. Stafford, San Francisco, Cal., assignor of one-third to Thomas Leach. No. 619,052. Dated Feb. 7, 1899. This invention relates to a device which is especially designed to exhibit advertisements or other displays which are printed or carried upon a sheet of considerable length so that the advertisements or other exhibits may be intermittently advanced, then stopped for a period of time and again advanced until the whole sheet has been exhibited, the operation continuing indefinitely. It consists essentially of a flexible sheet carrying the matter to be exhibited, drums with which the opposite ends of the sheet are connected and upon which it is adapted to coil and uncoil, belt rollers fixed to the drum shafts having a band extending from one to the other and adapted to coil alternately from one roller to the other in unison with the movement of the sheet upon its drums whereby the belt rollers are maintained constantly of the same diameter as the drums. An endless belt passes over these rollers and a roller through which power is transmitted is connected with the driving roller so as to impart motion thereto. Mechanism is provided by which the motion of the shafts may be reversed after the belt has been run out to the end, and it can then be returned to the point of commencement. The operation may be carried on by any suitable power applied to the mechanism, such as clockwork, with a suitable escapement.

Commercial Paragraphs.

THE largest inverted siphon in existence is now in successful operation at the Boise, Idaho, hydraulic mining property of the Twin Springs Placer M. Co. Almost the entire plant of this mammoth enterprise was furnished by the Joshua Hendy Machine Works, 38-44 Fremont St., San Francisco. Among other items of pipe, giants, air valves, water gates, etc., furnished the Twin Springs Placer Co. by that concern were 3000 feet 48-inch diam. pipe; 6000 feet 18-inch diam. pipe; 3000 feet 15-inch diam.; 2700 feet 11-inch diam.; nine 15-inch water gates; seven 11-inch water gates; fourteen hydraulic giants, assorted sizes, with deflectors and nozzles; about seventy air valves for pipe; four 48-inch expansion joints; three 18-inch expansion joints; one hydraulic derrick, seven tons capacity, complete.

THE Fulton Engineering & Shipbuilding Works, 15 First St., San Francisco, have finished another fine steam schooner, the Luella, which on her trial trip this week gave entire satisfaction to her owners, A. W. Beadle & Co.

POSITION WANTED by experienced cyanide man as superintendent of a mill or as assayer and chemist. Technical graduate. Will take charge of a cyanide proposition for a small salary with a percentage of the profits. Address S. C. M., care of Mining and Scientific Press, San Francisco, Cal.

WANTED — POSITION BY A CHEMIST, ASSAYER and MINING ENGINEER.
Cyanide a specialty. Speaks Spanish. First-class references. Address Box 28, this office.

WANTED — ASSAYER AND ANALYST DESIRES POSITION.
Experienced and reliable. Excellent references. Address COMPETENT, care of Mining and Scientific Press.

WANTED.
Capital to Handle Extensive Gold Mines.
JAMES ARTHUR, Cornucopia, Oregon.

WANTED.
Position as Superintendent or Assistant Superintendent of Copper Mining and Smelting Works.
Competent Smelter, Assayer, etc. Understands handling men; speaks Spanish; willing to go to Mexico or South America; best references. Address COPPER, this office.

P&B ROOFING

ROOFING is to a building what clothing is to the body. It must protect and it must wear well. To put money in an interior and to save it on the roof of a building is poor economy.

P & B ROOFING possesses all the requirements of a first-class roof covering. It is waterproof, durable, inexpensive, easily laid. Ask your dealer for a circular, or address the makers.

PARAFFINE PAINT CO.,
116 BATTERY ST., SAN FRANCISCO.

UNFAIR COMPETITION.

Our recent announcement that inferior goods had been sold and billed on the coast as our goods, and that our trade-mark numbers had been counterfeited, has disclosed an even greater extent of these practices than we had supposed to exist. To make the resulting damage to the reputation of our goods as small as possible and to protect our would-be patrons we repeat:

All our catalogue goods, except those listed by us as manufactured by others, are stamped with our name "Keuffel & Esser Co." or our initials "K. & E. Co." and where there is room for it, with our trade mark

Our German drawing instruments bear only the trade marks or

We never stamp our goods with catalogue numbers only, and goods so stamped are therefore not ours. All our goods are fully warranted to conform to the description we give of them in our catalogue and to be of the quality and grade specified. We make some lines of cheaper goods for the jobbing trade, but they differ from our catalogue goods in quality and appearance. These inferior goods are not stamped with any of our trade marks. Our catalogue goods are not furnished to any dealer or agent without our complete stamp as described above, and any claim that we furnish our catalogue goods by special arrangement without our stamp is therefore an attempt to deceive. Our special papers in rolls or sheets

Duplex Universal Anvil Paragon Normal

are watermarked or stamped along the edge with their name. Any claims that our papers are furnished by us in bulk without these names or that these papers have been obtained otherwise than through us, are absolutely false. We will thankfully accept any information bearing on the counterfeiting of our trade-mark numbers or the palming off of other goods as ours.

Very respectfully, KEUFFEL & ESSER CO.

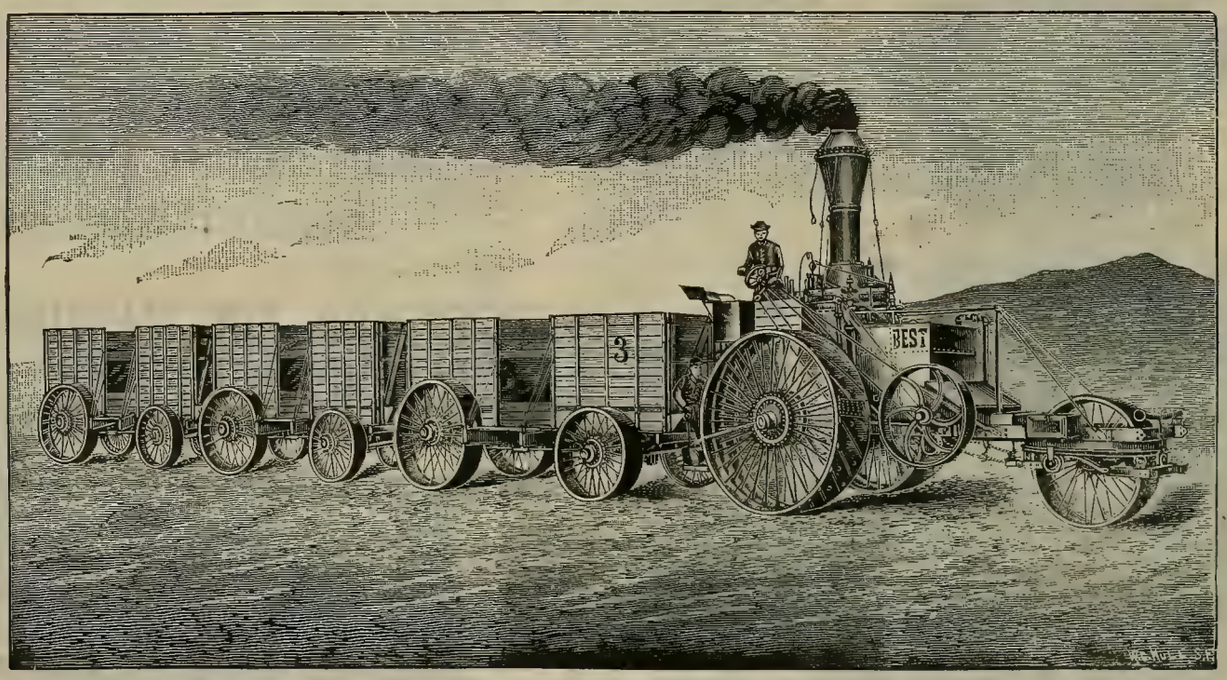
A REVOLUTION IN FREIGHTING.



THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Log Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address
